The location of an oil supply is sometimes more important than the supply itself. In 1942, when German submarines severed the tanker lifeline between the oil-hungry millions of our Atlantic Seaboard and the oil fields of Texas and Venezuela, location became all important. In this case it was the location of the oil fields and refineries of the Middle West and Southwest with respect to our railway system that saved the day. Until the completion of the unsinkable "Big Inch" pipe line from Texas to New York and the completion of several other pipe line projects, the railroads and their solid trains of tank cars were all that stood between the people of the eastern states and a dire oil famine that would have closed factories, paralyzed transportation, and caused sickness and death in countless cold homes and offices. During the peak of this astounding rail movement of oil in July 1943, receipts of tank car oil in the East averaged more than 980,000 barrels daily or more than 65 per cent of the oil received by every means.

Thus a supply of oil at one place and an urgent need for it at another is likely to result in trouble unless the transportation between the two places is at all times absolutely dependable. This condition immediately establishes two requirements for future oil supply: (1) that it be so located in the Western Hemisphere that alternative means of transporting it from source to market may be developed and maintained; (2) that if located elsewhere than in the Western Hemisphere, definite provision must be made for the maintenance and protection of tanker lines during emer-

gency, unless it should be our policy to draw heavily upon extra-territorial supplies in time of peace in order to conserve protected supply until time of need.

These are decisions which the policy makers of this country must face, and soon. The maintenance of the supply of such a vital necessity as petroleum can not be left to chance, because oil is one thing that time, unassisted, will not bring. Already, steps have been taken in the direction of a stable petroleum policy by the negotiation of an Anglo-American oil agreement which, when effective, will serve to coordinate and stabilize the worldwide oil production and distri-

bution practices of British and American nationals, and those of such other nations as may subsequently elect to subscribe to the treaty as finally ratified. Hearings on the ratification of the Anglo-American petroleum treaty will be held by the United States Senate early in 1946 and decisions made by the Senate at that time will go far toward defining the pattern of our oil future.

COMPETITION

In the American petroleum industry, competition for public favor and for outlet has been predominantly responsible for the phenomenal progress that has been made in all branches of the industry. This competition which has resulted in such low prices for petroleum products of all kinds has also been responsible for the nondevelopment of more expensive substitutes for petroleum. Synthetic oils, when needed, may be derived in large quantities from coal or oil shale if the public is willing to pay the higher price that more expensive methods require or if research and progress are able to reduce the costs of extraction.

1945[1]	1,720,500,000

[1] Preliminary, subject to revision.

However, it is well to consider the magnitude of some of these alternative operations. If each ton of coal or oil shale yielded an average of one barrel of oil it would require about 5,000,000 tons of coal or shale a day to supply our oil. This amounts to about 1,800,000,000 tons a year or approximately three times the maximum yearly production to date. In other words, coal production might have to be quadrupled and an additional mining investment of something like $25,000,000,000 would be needed.

When it comes to using fuels derived from wood or farm products the prospects of immediate substitutes for petroleum are just as discouraging. This is because 5,000,000 barrels of petroleum a day is much more than anyone realizes. A mass of something like 250,000,000 tons a year is involved. This may not seem large

but it happens to be somewhat more than all the foodstuffs produced yearly by United States farms. However, the farm products were worth four times as much as the oil produced, a fact worth remembering when edible farm crops are proposed as substitutes for very cheap fuel. Of course, corn and wheat have been used for fuel in the past and probably will be so used again but their use as large scale substitutes for oil or coal seems very remote.

TABLE XII

OIL AND ATOMIC ENERGY

On the subject of competition from nuclear energy, the difficulties and costs confronting the commercial utilization of atomic energy are such as to indicate that petroleum as a source of mobile power and domestic heat need not worry about competition from atomic energy for many years to come. In fact, several of the leading nuclear physicists have said this very thing, yet when we observe the headlong drive of modern science toward the frontiers of the universe, we may well wonder if atomic energy of some kind, whether resulting from fission or from fusion, may not soon be gradually adopted, first to the generation of electricity, then to marine power, then to central heating—provided, of course, that the diversion of all this energy to destruction and devastation does not bring another Dark Age to the world.

So, petroleum faces competition as a source of heat and motion. It faces depletion also, and the question in the public mind is whether new sources of energy will be available before petroleum becomes so expensive and scarce as to discourage its use. That is something that this generation need not worry about, unless war again lays its frightful hand upon our lives and our resources.

Petroleum production of the United

TABLE XIII

ESTIMATED ANNUAL COST OF MOTOR FUEL AND TAXES PER CONSUMER

(Based on average number of motor vehicles in use each year)

[1] Preliminary, subject to revision.

States and Venezuela in 1945 soared to new highs, and estimated world production reached a figure not likely to be materially changed by post-war revision of the production estimates of oil producing countries which were occupied or dominated by the enemy. U. S. production alone amounted to 61.3 per cent of the world total, although our percentage of the known petroleum reserves of the world is only about 34 per cent.

1945[1]	2,053,362,000

[1] Preliminary, subject to revision.

Actual refinery runs of crude oil averaged 4,718,000 barrels daily during the entire year of 1945. The tremendous expansion and improvement of refinery facilities since 1941 has been required by the urgent and unprecedented demand for petroleum war products of which 100 octane gasoline is only one of many. This complete modernization of nearly all of the larger refineries of the U. S. represented an investment of nearly $900,000,000—more than 75 per cent of which was borne by the refining companies without governmental assistance.

DIVISION XIII

MANUFACTURES AND TRANSPORTATION

CONDITIONS IN MANUFACTURING

By L. Seth Schnitman
Transportation and Public Utilities Division,
Office of Price Administration

GENERAL

Hostilities over, 1945 might well have been the year in which both industrial management and labor finally learned that, in peace as in war, all-out goals are attainable, but only when there is an enlightened and determined collective will to serve the national interest. Instead, the year that easily could have established a pattern for enduring prosperity in peacetime produced a success story of a disconcerting kind—of industrial conflict, of bitterness and deadlock, unexampled in our entire history.

Far from providing the orderly transition from war to peace that had been widely heralded, 1945 marked the atavistic reversion to the "dog-eat-dog" attitudes and caprices that had characterized earlier periods in our history. Victory achieved in our battle for very existence, we were now at war with ourselves.

Again, we were seeing the branch and not the tree; we were confounding the shadow of high wage rates with the substance of high purchasing power; we were counting profits before they were earned and were beginning to look with disdain at the only means by which they could be derived. In short, we were generally viewing the economic horizon from the wrong end of the telescope. Small wonder that the index of industrial production (manufacturing and mining combined) as computed by the Board of Governors of the Federal Reserve System reflected so faithfully what happened to American industry in 1945; that, at the year-end, actual industrial production was probably not more than 65 per cent of our war-expanded capacity.

INDEX OF INDUSTRIAL PRODUCTION

For 1945, the combined output of our mines and factories, by volume, was some 13 per cent lower than in 1944 and virtually 15 per cent smaller than in 1943, the all-time peak year in the annals of American industry. This decline in production, however, was less the result of the sequential surrenders of Germany and Japan alone than is generally supposed; it was as much or more the acceleration or culmination of a pattern that became visible months before. The bald fact is, not a single month of 1945 was able to show a production volume as high as that recorded for the corresponding month of 1944. To get an even clearer picture of what happened to the index of industrial production, these additional bench-marks may be cited: though the average for the first half of 1945 recorded a loss of but 3 per cent from the corresponding period of 1944, the average for the final half of 1945 was 23 per cent lower than for the last half of 1944. Moreover, the December, 1945 index was virtually 25 per cent lower than that for December 1944.

Despite this cut-back in production, the index for 1945 as a whole was about 104 per cent higher than the average for the five-year period, 1935 through 1939; for December, 1945, it was still some 75 per cent above the base period average, despite the most disturbing labor-management outlook in a generation.

For manufacturing alone, apart from mining, the 1945 production record was a bit worse than that shown for the combined index, the losses from 1944 and 1943 being about 14 per cent and 16 per cent, respectively. Significant further facts follow: for the first half of 1945, manufacturing output was 4 per cent smaller than in the like period of the preceding year; in the final half-year 25 per cent lower than in the corresponding period of 1944; and for December alone, some 28 per cent smaller than during December 1944. Such, with all of its repercussions, were the costs of the transition to peace, though we had all but been lulled into the hope, if not belief, that "reconversion" would be economically painless; such were the rewards for sorrow, sweat, and sacrifice, though we had a right to expect that the unmeasurable remorse and travail which we suffered would provide an open sesame to full production, and its hand-maidens, full employment and full distribution.

DURABLE MANUFACTURES

It was, however, in the so-called durable goods industries, as distinguished from other manufactured items, that the most distressing aspects of this transition period appeared. The 1945 volume of durable goods production, including such items as iron and steel, machinery, automobiles, non-ferrous metals, lumber and its products, and other building materials, was 22 per cent smaller than in 1944 and almost 24 per cent lower than in 1943.

The decline of 6 per cent from 1944 during the first half of 1945 contrasts with a loss in the final six months of about 37 per cent; for December 1945 alone the loss from a year earlier was at least 40 per cent. Pity, this, because it was to the durable goods industries that all eyes were glued for a clue to the economic horizons for 1946 and beyond; because too, it is these industries that alone could generate the necessary activity to satisfy the promises of a better economic order. To be sure, with all the cutbacks in durable goods production which followed on the heels of victory on the battlefronts, the 1945 volume was still 177 per cent higher than in the base period years of 1935 to 1939. If anything, such a record only tends to focus attention on the problems which must be solved, if we are for long to maintain even so high a level of production.

NON-DURABLE MANUFACTURES

The index of non-durable manufactures covering 1945 output showed a shrinkage of but 2½ per cent from 1944 and 5 per cent from 1943. This small decline was in striking contrast with what happened to durable goods manufacturing output and yet it was understandable in the face of the unexampled demand for such things as textiles and their manufactures, leather and its products, manufactured foods, and other manufactured items for ready consumption, production of which for civilian uses had been restricted during the war. If "reconversion" in the non-durable goods industries was all but completed without incident or fanfare it only served to accentuate the disappointments that visited the durable goods industries during the difficult months of transition to peace.

RELATIONSHIPS BETWEEN DURABLE AND NON-DURABLE MANUFACTURES

In a sound economy, there must be relative balance between the manufacture of durables and the output of non-durable goods, for in the last analysis durable goods manufactures, through the channels of trade, must exchange for non-durable items. The 1945 ratio between the indexes of these two major categories of manufacturing was 1.66, or .66 above unity, which may be said to represent true balance. (A ratio below 1.00 would be subnormal, while a ratio above 1.00 may be called abnormal). Though the table below discloses that the 1945 ratio was measurably lower than the ratio for 1944, it seems to say that further downward readjustment in production is ahead, that is, if the record of previous peacetime years has any significance. The high ratios for 1919 and 1920, it may be noted, were followed in 1921 by a downward reversal in production, as the ratios for 1928 and 1929 foreshadowed a decline in production for 1930. This is another way of saying that for 1946 as a whole, durable goods production, more than with non-durable goods, is likely to show a fairly substantial decline from 1945, perhaps as much as 15 per cent. Even so, total manufacturing output is likely to be at least 75 per cent higher than the average during the five years, 1935-1939.

PRODUCTION INDEXES FOR DURABLE AND NON-DURABLE MANUFACTURES*

(1935–1939 Average = 100)

Year	Durable	Non-durable	Ratio: Durable / Non-durable
1919	84	62	1.35
1920	93	60	1.55
1921	53	57	.93
1928	117	85	1.38
1929	132	93	1.42
1930	98	84	1.17
1931	67	79	.85
1932	41	70	.59
1933	54	79	.68
1934	65	81	.80
1935	83	90	.92
1936	108	100	1.08
1937	122	106	1.15
1938	78	95	.82
1939	109	109	1.00
1940	139	115	1.21
1941	201	142	1.41
1942	279	158	1.77
1943	360	176	2.05
1944	353	171	2.06
1945	277	167	1.66

* Basic data, from Board of Governors of the Federal Reserve System. Ratios for specified years computed.

FOOD PRODUCTS

The index of production of manufactured foodstuffs for 1945, at about 152 per cent of the average for the base period (1935-1939), showed no change from the high record of the previous year and was virtually 5 per cent higher than in 1943, thanks to the unexampled level of the national income and an unsated export demand. Not all manufactured foods, however, shared fully in this sustained high output level as, for example, in the case of manufactured dairy products for which, combined, the 1945 index was about 2 per cent lower than in 1944. Butter production declined by about 7 per cent; cheese output suffered a loss of almost a like amount, and canned and dried milk declined by about 5 per cent. Wheat flour production, on the other hand, showed an increase of better than 10 per cent.

Meat packing in 1945 showed a loss of about 20 per cent from the previous year, almost entirely because of the inability of a substantial gain in the output of beef to offset a 35 per cent loss in the output of pork and pork products. Processed fruits and vegetables showed a new high level of output in 1945. At about 142, that index was not only some 42 per cent higher than the average of the five-year period (1935-1939), but also exceeded the 1944 level by about 6 per cent.

As the year wore on, scarcities in foods began to disappear except with respect to sugar and most edible fats and oils, witness the general removal first of "blue-point" and then of "red-point" rationing. Since expenditures for food have tended over the years to fluctuate with the national income, it is of more than passing moment to note, too, that retail sales reported by grocery and other food stores approximated $18,000,000,000 of which about $14,000,000,000 represented the sales at the manufacturing levels.

CONFECTIONERY, LIQUOR, TOBACCO

The production of candy and confections, entirely because of the acute sugar shortage, was about 5 per cent lower in 1945 than in 1944. Alcoholic beverages, on the other hand, showed a production gain of better than 20 per cent, most especially because of resumption of the output of whiskey.

Once again the production record of the tobacco products manufacturing industry chalked up another new high; this time the gain over the previous year was about 15 per cent. The output of cigars alone in 1945 was not only about 15 per cent higher than in 1944 but for the first time in recent years exceeded the volume of the base period (1935-1939). Cigarette production, too, showed a substantial gain in output in 1945 over the total for 1944.

TEXTILES, SHOES, APPAREL

The 1945 production of textiles and their products, in the aggregate, showed virtually no change from the level of the previous year. Cotton consumption dropped by about 4 per cent while deliveries of rayon to consuming mills, in recording an advance of better than 10 per cent over the 1944 total, made a new all-time record. The contrast between cotton and rayon is further accentuated by a backward look at the base period (1935-1939). For cotton, the 1945 consumption total was 38 per cent higher and for rayon 119 per cent greater than in that five-year period.

Wool textiles, too, were generally produced in lower volume in 1945 than in 1944, largely because of losses in woolen and worsted yarns and woolen and worsted cloth. Apparel wool, on the other hand, showed a modest gain in consumption when compared with the volume in 1944. For carpet wools, the 1945 consumption level was almost 20 per cent higher.

Clothing shortages were not as acute in 1945 as was generally supposed, else manufacturers could hardly have shown production and sales volumes which broke all earlier records. In the dress field, improvement in the flow of supplies is likely to come more rapidly for rayon and wool fabrics than in cotton dress goods, and it is all but certain that manufacturers of men's suits and overcoats in 1946 will enjoy the largest volume in history, so incessant is the demand of returned veterans and of other civilians who want and are able to buy that extra or that better suit.

The output of leather and leather products showed an increase of about 3 per cent over the 1944 index. Leather tanning was only fractionally better than in the previous year, but shoe production was almost 7 per cent higher than in 1944.

PETROLEUM AND REFINERY PRODUCTS

Crude petroleum production in 1945 expanded by about 2½ per cent over the total for the previous year. In establishing this mark, the index was some 46 per cent above the average for the base period (1935-1939). Gasoline production broke all earlier records, exceeding the 1944 volume by almost 10 per cent. Other refinery products, were produced in greater volume than in the preceding year, except kerosene which just about held its own; for fuel oil the increase was about 2 per cent and for lubricating oils, the increase approximated 3 per cent. But for the disappointing showing of the automobile industry, production in which fell months behind schedule, refinery operations might well have provided even more glowing records of production, so completely had this industry reconverted to peacetime concepts.

As the year ended, stocks of gasoline at refineries, in transit, and at bulk terminals were around 90,000,000 barrels and were piling up at a rate in excess of 2,000,000 barrels weekly. It is of more than passing moment, too, to record that the peak wartime production of crude petroleum exceeded 5,000,000 barrels a day which level promises not only to be maintained but also eclipsed during 1946, once oil field equipment becomes plentiful. The year 1946, too, promises to see an expanded modernization program on the part of principal refineries and an extension in service stations not only to service automobiles but also commercial and pleasure aircraft. Almost irrespective of likely improvement in the natural rubber situation, large use of oil in the manufacture of synthetic rubber is all but assured for years to come.

PAPER AND PAPER PRODUCTS

In transition, as in war, the paper and paper products industries had a difficult time of it. For 1945 the combined index of production was about 1½ per cent lower than for 1944 and about 3 per cent smaller than for 1943. Even so the level of output was some 33 per cent higher than the average for the five years, 1935-1939. Production of wood pulp, mechanical and chemical combined, did manage to maintain the 1944 level, thanks to the effectiveness of the waste salvage program.

The 1945 output of paperboard containers showed a gain of about 2 per cent over the total of the previous year but fine paper production showed a shrinkage of more than 25 per cent and was only a little more than 60 per cent as large as in 1943. Printing paper production expanded by almost 10 per cent in 1945 but the output of tissue and absorbent paper receded by some 6 per cent from the 1944 total and by some 14 per cent from the 1943 level. Wrapping papers were produced in about 7 per cent greater volume than in 1944 and 1943 while newsprint production barely scaled the 1944 total for an index that was some 20 per cent smaller than the average during the five years, 1935-1939.

The printing and publishing industries, in recording an expansion of 7 per cent, almost reached in 1945 the volume they enjoyed in 1943. At the same time, though the newsprint situation eased somewhat, as may be seen from a 6 per cent consumption gain, newsprint deliveries to consumers in 1945 were 9 per cent lower than in 1944.

CHEMICAL PRODUCTS

The index of the output of chemicals and chemical products, because of large cutbacks in explosives and ammunition after VJ-Day, was 12 per cent lower in 1945 than in 1944; the loss from 1943 exceeded 26 per cent. Paint production barely equaled the 1944 total but soap output was about 2 per cent smaller. The output of rayon, however, in recording an advance of about 3 per cent broke all earlier records and for the year was almost 145 per cent higher than the average in the base period (1935-1939). Industrial chemicals sustained a production loss from 1944 of around 2 per cent.

In dollars, the value of chemical production in 1945 was probably near $2,200,000,000, for a loss of perhaps as much as 15 per cent from the total for 1944. Further decline seems probable in 1946 whether measured by volume or value because of the loss of the war-born demands for explosives and ammunition. Capacities and plants previously engaged in such production, however, may be counted upon to be turning out synthetic fibers, plastics, unbreakable glass, laminations of plastics and wood, hydro-carbons and a wide variety of other products that not long ago were only in the test-tube stage. Consider plastics: here, 1946 output is likely to reach and exceed 1,000,000,000 pounds for the first time, against a figure of not more than 900,000,000 pounds in 1945 and perhaps 800,000,000 pounds in 1944.

Drug and pharmaceutical production in 1945 was well sustained and promises to expand further in 1946 when manufacturers of both ethical and proprietary drugs complete their planned expansion programs which involve expenditures equaling or exceeding amounts spent at the wartime peak.

RUBBER PRODUCTS

The production of rubber products in 1945 showed a loss of some 8 per cent from the volume of the previous year. Even so, the 1945 total was about 115 per cent higher than the average for the five-year period, 1935-1939. What the industry lost in production in 1945 is likely to be more than made up in 1946, if for no other reason than the unsated demand for tires to meet which the industry will likely produce at least 85,000,000 units, both for passenger cars and trucks. Natural rubber will once again be in evidence perhaps in a ratio of 1 to 2 of synthetic rubbers, with every indication that the aggregate tonnage of raw-rubber to be used, all kinds, will hit an all-time high.

MINE OUTPUT

The 1945 record of mine production—copper, silver, coal, iron, petroleum, lead, zinc, and gold—unlike the situation with respect to manufacturing output, almost equaled the level of the preceding year; for fuels as a group the index was about on a par with that for 1944 while for metals, a loss of only about 3½ per cent occurred.

ELECTRIC UTILITIES AND EQUIPMENT

Termination of war contracts brought with it a drop in electric power output as was to be expected; yet, the overall decline for the year as a whole approximated only 3 per cent. The domestic load, taken alone, however, showed an expansion of 9 per cent over the corresponding total for 1944.

Manufacturers of electrical equipment of all descriptions showed a production total of about $7,000,000,000 in 1945 for a loss of more than 20 per cent from the all-time peak of the preceding year and in contrast with a volume of but $2,475,000,000 in 1940. Irrespective of the large cutback which occurred in 1945, however, further retrenchment is almost certain for 1946 which might run to as much as 40 per cent, there being nothing on the horizon that can take up the slack which was caused by the termination of hostilities.

RAILROADS AND RAILROAD EQUIPMENT

War over, the job of the railroads to move the military and its equipment was yet to be completed. Moreover, the nation was still to regain the comfort and conveniences of rail travel and the timeliness of freight deliveries of the days before Pearl Harbor. To restore such service, even to improve it, and to take its rightful position in the competitive struggle for a place under the transportation sun, the railroads of the nation have made broad plans which, over the next three years, are to involve capital expenditures of almost $1,750,000,000. All of this can only mean expansive production in a wide variety of feeder industries, such as steel, locomotives, freight and passenger cars, rails, even lumber and building materials.

IRON AND STEEL

Measured by the index of the Board of Governors of the Federal Reserve System, iron and steel production in 1945 was about 11 per cent lower than in 1944. Nevertheless, the year's volume was about 85 per cent higher than the average for the five years 1935-1939. Pig iron output was about 12½ per cent smaller than in 1944 while the output of steel was about 10 per cent lower. The shrinkage in electric steel was understandably much greater than was the decline in open hearth production, 16½ per cent in the former and about 10 per cent in the latter. As the year drew to a close, a steel strike loomed that threatened further to disturb and retard the conversion processes in many steel-consuming industries.

NON-FERROUS METALS

Non-ferrous metals as a group sustained a production loss of 20 per cent from the 1944 volume; yet, the 1945 index was 107 per cent above the average for the base period (1935-1939). Smelters' and refiners' operations were almost 30 per cent lower than in 1944 while operations of fabricators declined by only about 18 per cent.

AUTOMOBILES

Perhaps the greatest disappointment of 1945 occurred in the automobile industry, for which production estimates had ranged up to 750,000 passenger units for the months after VJ-Day, in contrast with a realized total of no more than 75,000. Civilian truck production fared better, with an estimated 1945 total of 315,000 units. Even as this is written a dark cloud still hovers over the industry, strikebound itself and, worse, enmeshed in a net of strikes, real and threatened, in feeder industries and in steel. Where is the 7,000,000 car production objective, when now it is already clear that a production total of as high as 4,500,000 for 1946 would be a real accomplishment?

MACHINERY AND EQUIPMENT

Machinery production in 1945 sloughed off substantially from the totals for both 1944 and 1943, the losses amounting to 21 per cent and 22 per cent, respectively. The real impact of victory was best reflected, however, by the December 1945 index which was only 60 per cent as high as a year earlier; yet, it should be noted that the volume for 1945 as a whole was virtually 3½ times as great as the average for the five years, 1935-1939, and that for December alone it was still 2½ times as great as that peacetime average, and that if such a level could be maintained it would tell of continued high industrial activity.

Machine tool output in 1945 had an estimated value of around $400,000,000. For 1946 it is likely to drop to $250,000,000; nevertheless, such a volume would be at least $50,000,000 in excess of the total for the best prewar year. Demands for machine tools on the part of manufacturers of automobiles, farm equipment, and electrical equipment will in 1946 no doubt account for a large proportion of the total output.

The index of production covering transportation equipment (automobiles, aircraft, railroad cars, locomotives, shipbuilding) declined by almost one-third from the 1944 level; worse, the December, 1945, index was hardly 35 per cent as high as the figure for December, 1944; nor is it likely that gains in 1946 for automobiles, railroad cars, and locomotives can offset further certain losses that loom for aircraft production and shipbuilding.

BUILDING CONSTRUCTION AND MATERIALS

Second only to agriculture in its importance to our economic health, the construction industry for 10 of the 12 months of 1945 exhibited unmistakable signs that it was readying itself for better times. For the year as a whole, new construction started, private and public, involved committed expenditures that were at least 60 per cent higher than those covering work started in 1944, part of which increase, to be sure, was owing to increased costs. If only the construction industry, most especially residential building, and the automobile industry, together, could find release from the pegging influences of labor-management differences all across the economic stage, much of the promise for full production and full employment could be realized.

Lumber output in 1945 was almost 20 per cent smaller than in 1944, while for December alone, because of labor difficulties, the production was off by virtually 30 per cent from a year earlier; worse, with all the pent-up demand, the year 1945 only managed to show a production total equal to the average for these relatively lean construction years, 1935-1939. Cement output, on the other hand, was almost 12 per cent greater in 1945 than in 1944 and for December alone showed a gain over the December 1944 total of better than one third. Paradoxically, clay building products and gypsum and plaster products in 1945 were produced in smaller aggregate volumes than in the preceding year. Plumbing and heating equipment, too, were on disappointing production schedules. Whatever else this distressing situation reflected, it served most of all to point up the need for a new approach to a very old problem. The basic construction industry is notoriously one of famine or feast. Left to flounder, the entire transition process could be irretrievably retarded.

CONCLUSION

With reckless abandon, we were increasingly coming to ignore the facts of history. The "silk-shirt" era of a generation ago was back in meretricious attire. Gold toothpicks, mink wraps for canine pets, hand-painted neckties, black markets, crime waves, stock market tips, speculation, industrial strife, were but the outward evidences, the symbols, by which we may for all time identify these turbulent days. Beneath such veneers, however, were forces that long since had been deeply grained. After years of war and its inevitable dislocations—social, economic, even political—these forces will either rule this generation or be harnessed by it and turned to useful account. There is no middle course. Only understanding, compromise, decision, and action can produce the tools by which the nation may avoid the horrendous implications of our new and explosive pattern of savings, purchasing power, short supplies, and unparaleled demands.

THE UNITED STATES TARIFF COMMISSION

By Oscar B. Ryder
Chairman, The United States Tariff Commission

Commissioners

Oscar B. Ryder, Chairman
Lynn R. Edminster, Vice Chairman
Edgar B. Brossard
E. Dana Durand
George McGill

E. M. Whitcomb, Acting Secretary
New York Office—Room 513, Custom House
Samuel W. Pitts, In Charge

FUNCTIONS OF THE COMMISSION

The United States Tariff Commission is an independent nonpartisan Government agency whose principal function is to ascertain facts upon the basis of which Congress may determine policies affecting the foreign trade of the United States.

Title VII of the Revenue Act of 1916 provided for the establishment of the Tariff Commission and outlined the general scope of its functions. The Tariff Commission's basic functions were extended under the Tariff Act of 1922 by the inclusion of section 315—the flexible-tariff provision; section 316—the provision prohibiting unfair acts in importation of goods; and section 317—the provision for penalizing the trade of countries which discriminate against the trade of the United States. Similar provisions were continued in the Tariff Act of 1930 in sections 336, 337, and 338, respectively. From time to time other special provisions of law gave the Commission additional duties. Among these were Section 22 of the Agricultural Adjustment Act, and the Trade Agreements Act which was enacted in 1934 for a three-year period and extended in 1937, 1940, 1943, and with increased authority in 1945. The Trade Agreements Act required that information and advice be sought from the Tariff Commission in connection with the negotiations of agreements.

HISTORY OF THE COMMISSION

In the first few years of its existence, the Commission published reports on reciprocity and commercial treaties, on colonial tariff problems, and on customs administrative laws, and a series of reports on commodities for which the war had raised special problems of tariff policy. In 1921, to assist in the Congressional tariff revision then under way, it issued the first edition of the *Summaries of Tariff Information* (now called *Summaries of Commodity Information*), containing data on production, imports, exports, and competitive conditions respecting all commodities involved in the import trade of the United States.

From 1921 through 1933 the Commission, in addition to its extensive activities under the flexible provisions, published a number of extensive surveys and reports on specific commodities, and expanded and brought up to date the *Summaries of Tariff Information*, which were a constant source of reference during the consideration by the Congress of the bill which became the Tariff Act of 1930.

From 1934, when the Trade Agreements Act was passed, until the beginning of the war in 1939, work in connection with trade agreements constituted the largest segment of Commission activities. Other work, mainly under general powers of the Commission, continued on a substantial scale. Of special importance were the extensive reports prepared during this period on the trade and trade policies of countries such as Japan, the Philippines, Germany, Italy, and France. Almost as important were the reports prepared on commodities such as wood pulp, nitrates, and iron and steel, which presented special import problems.

WAR AND POST-WAR ACTIVITIES

Beginning in the fall of 1939, the Commission directed its activities largely to immediate war problems and to giving all possible assistance to defense agencies and to their successor war agencies. Almost immediately after the beginning of the war in Europe, the Commission made a study of the current and probable future effects of the war on United States imports and on the ability of this country to provide commodities necessary for defense and civilian consumption. When the Office of Emergency Management was established, it not only drew personnel from the staff of the Tariff Commission but in part of its work relied largely on commodity information compiled by the Commission's staff. As war agencies succeeded defense agencies, the cooperative activities of the Tariff Commission were increased to give every possible assistance in the prosecution of the war.

Beginning in the fall of 1943, the Commission turned increasing attention to post-war problems. At first on its own initiative and later at the request of the Finance Committee of the Senate and the Ways and Means Committee of the House, the Commission undertook the preparation of a series of special reports on the post-war foreign-trade position of the United States, as to its total trade and as to its trade in specific commodities and with specific countries. Fifteen reports in this series have so far been completed and work is proceeding as rapidly as possible upon the remaining reports planned to be included in the series. This and activities in connection with the expanded trade agreements program will be the most important phases of the Commission's work during 1946.

CURRENT WORK IN POST-WAR ESTIMATES

The current work of the Commission falls under the following headings: (1) Work in response to Congressional requests, (2) work on trade agreements, (3) work on interdepartmental committees, (4) work for war agencies, and (5) miscellaneous work.

By far most of the Tariff Commission's work during the past year was directly requested by the Congress or by Congressional committees. In December 1944 the Senate adopted Senate Resolution 341, directing the Tariff Commission, under certain assumptions as to national income and tariff treatment, to estimate, for all articles imported in 1939 with a value in excess of $100,000, post-war production, consumption, imports, and employment. The resolution required the Commission to give precedence to work under it over all other work except that for war agencies, and from December 1944 through April 1945 the entire available staff was put to work preparing the reply to the Senate. Data relating to more than 450 articles or groups were closely examined. The report is now available in printed form and represents the only comprehensive and thoroughgoing analysis that has been made as to the probable course of the import trade of the United States in the post-war period.

The Senate Committee on Finance and the House Ways and Means Committee have requested reports on: (1) United States industries which have been substantially affected by the war in such manner as to alter their competitive position in relation to the industries of foreign countries, with particular attention to those domestic industries which have had, or may be expected to have, important problems of competition from imported articles; (2) effects of the war on the general foreign-trade position of the United States; and (3) changes since 1929 in the international trade policies of foreign countries, particularly as they have affected and are likely to affect the trade of the United States.

In response to the first of these requests, the Commission is preparing a series of reports, designated as War Changes in Industry series, relating to 75 major commodities or industries. Each report of the series reviews the conditions of production and competition in the industry before the war, the changes caused by the war, and the problems which may be encountered after the war. Fifteen of these reports have been issued. They cover the following subjects:

Raw Wool
Industrial Alcohol
United States Stock-pile Wools
Dehydrated Vegetables
Mercury
Rubber
Pottery Tableware
Red Cedar Shingles
Sheet (Window) Glass
Magnesium
Cigarette Paper
Magnesite
Hides, Skins, and Leather
Iron and Steel
Aluminum

Other important commodities included in this series are the following:

Dyes
Animal and Vegetable Oils and Fats and Materials Thereof
Watches
Cattle and Beef

PROBLEMS OF COMMERCIAL POLICY

In preparing the report called for by the second request—on the effect of the war on the general position of the United States in world trade—the Commission is attempting to concentrate attention on the crucial problems of commercial policy which are facing the United States.

The request for a report on the changes in the international trade policies of foreign countries since 1929, particularly as they affect the industry and trade of the United States, is being answered by the issuance of a series of reports covering selected countries. As part of this series, the Commission is preparing reports on each of the Latin American countries, covering the probable post-war conditions as to economic controls and commercial policies; and, for the more important countries, reports on agricultural, pastoral, and forest industries; mining and manufacturing industries; and recent developments in foreign trade. About 50 of these reports are planned; 35 have been completed. The Commission has also completed a series of studies on prewar commercial policies and trade in Greece, Rumania, Bulgaria, Yugoslavia, Spain, and Austria, and is preparing reports on the principal countries in the British Empire.

PUERTO RICO AND THE PHILIPPINES

At the request of the Senate Committee on Territories and Insular Affairs, a report is being prepared on the Economy of Puerto Rico which deals with the varied and difficult problems that arise in the administration of this island possession.

Philippine problems created by the war are very serious and have been given much attention by the Commission. The Vice Chairman of the Commission, by designation of the President, serves as a member of the Filipino Rehabilitation Commission, and members of the staff contribute to the work of that body.

A senior member of the staff has been assigned at the request of the President to assist in a special study of Philippine problems. Legislation incorporating the results of this study, now pending before the Congress, has been the subject of a recent report.

EXTENSION OF TRADE AGREEMENTS ACT

Of special importance is the work done for the Congress in connection with pending legislation. The largest volume of such work was done in connection with the extension of the Trade Agreements Act. Members of the staff were assigned to assist both the majority and minority members of the Ways and Means Committee and the Senate Finance Committee. The Commission also prepared for the Ways and Means Committee an index to the voluminous hearings on the extension of the Trade Agreements Act. In addition numerous reports have been prepared on bills relating directly or indirectly to foreign trade.

TRADE AGREEMENTS WORK

The Commission is represented on the Trade Agreements Committee and the Vice Chairman heads the Committee for Reciprocity Information. In addition, the Commission is represented on all the country committees and other special subcommittees set up to serve the Trade Agreements Committee. Currently, negotiations are being considered with many important trading countries of the world. The greatly increased work on trade agreements is expected to continue to increase throughout this fiscal year and to remain at a high level throughout the next fiscal year.

The Tariff Commission issues digests of information with reference to each trade agreement. The information contained in these digests represents material drawn from the detailed data made available by the Tariff Commission to the trade agreements organization on domestic production, imports and exports, and conditions of competition for commodities on which the United States has made concessions in the trade agreements.

The digests constitute the only form in which this information is published and are in demand by the domestic industries concerned, the importing trade, and the Congress.

In addition to direct work of the Commission on trade agreements, the staff also serves the Committee for Reciprocity Information both in the matter of research and in the summarization of briefs and testimony submitted to that Committee.

WORK ON INTERDEPARTMENTAL COMMITTEES

Much of the contribution which the Commission makes toward the solution of questions of international trade policy is made through its representation on, and work for, interdepartmental committees. In addition to its representation on the Executive Committee on Economic Foreign Policy and on the Trade Agreements Committees, members of the Commission or of its staff serve on many interdepartmental committees organized to assist those committees and on others sponsored by various government departments.

WORK FOR WAR AGENCIES

About one-fourth of the Commission's activities during the fiscal year 1945 was directly for war agencies. The surrender of Japan necessitated review of these activities and most of them will be terminated before the end of the fiscal year 1946.

During the fiscal year 1945 half of the accounting force of the Commission, assisted by commodity experts and economists, was assigned to projects having to do largely with the costs and the cost-price relationships prevailing among firms from which the War Food Administration was purchasing supplies. The principal commodities covered were milk; canned meats; butter, cheese, and evaporated, condensed, and dried milk; canned vegetables and fruits; eggs; and fish. As a result of the Commission's investigations, the War Food Administration was placed in a position to determine what adjustments should be made in existing contracts or what changes should be made in future contracts in the interests of both the Government and producers.

Work for the Office of Price Administration during the same period was related almost entirely to costs and selling prices of textile products, principally print cloths, fine cotton cloths, and shirts, shorts, and nightwear. For all products the work has involved difficult cost accounting problems, and its results have formed a basis for many of the decisions made by the Office of Price Administration in pricing the products in question.

Cooperation between the Tariff Commission and the Foreign Economic Administration and its predecessor organizations has always been extensive. The principal phase of activities for FEA in the past fiscal year was the study of the Japanese economy and trade for the purpose of determining the extent to which Japanese facilities were built up for war purposes either directly or indirectly, and the effect of the continuance or discontinuance of the several industries in the post-war period on the trade and economy of the United Nations, particularly the United States.

The War Production Board has depended upon the Tariff Commission for the collection of production and sales statistics on synthetic organic chemicals, and for the tabulation and analysis of statistics on domestic consumption of certain fibers. Through its New York office, moreover, the Commission has supplied the Board, especially its Bureau of Stockpiling and Transportation, with current information obtained by invoice analyses of imports of numerous commodities.

The Commission's work for the War Department has been varied. At times during the past year the Commission lent especially qualified personnel for assignment to particular subjects. At present, the Commission is collaborating with the Department in its program for investigating the Japanese textile and leather industries, and is also making available certain of its experts for work on similar programs in conquered territory other than Japan.

MISCELLANEOUS WORK OF THE COMMISSION

Under this heading fall projects such as the Census of Production and Sales of Synthetic Organic Chemicals; the investigation now in progress on the Customs Administrative Laws; and the general commodity work of the Commission.

Work on the annual Census of Synthetic Organic Chemicals has been carried on continuously since 1918. The latest report, for the year 1944, was issued. During the war, final reports on these synthetics were withheld for security reasons; but data for the years 1941, 1942, and 1943 are now being printed in one volume for the use of those concerned with production and trade in these products.

Section 332 of the Tariff Act of 1930

directs the Tariff Commission, among other things, to investigate the operations of customs laws. The Commission has initiated such a study, in the course of which the entire range of customs administrative laws and procedures is being scrutinized carefully to determine where changes should be made in order to make it more likely that the objectives set forth in the laws are reached.

The Tariff Commission maintains a small force in New York City. The office analyzes the entry papers and obtains data needed by the Commission or by other government agencies to supplement the information on imports contained in published statistics of the Department of Commerce. The data so obtained are included in the summaries of commodity information, and some that are of particular value to the trade are issued for public distribution.

ADMINISTRATION OF TARIFF LAWS

By C. A. Freeman
Division of Fiscal Administration, Bureau of Customs, Treasury Department

GENERAL

Even with the war in Europe ended and with that in the Orient rapidly approaching its climactic conclusion, the end of the fiscal year 1945 found the foreign commerce of the United States, in no less a degree than its domestic economy, as much on a wartime basis as at the year's beginning. In consequence, the nature and sources of our imports and of the revenues collected therefrom, continued during the last full year of the Second World War, to be determined more by the exigencies of war than by ordinary consumptive requirements. In addition to those activities which could be measured in fiscal terms, non-fiscal customs activities continued to a large degree to reflect wartime pressures and distortions.

CUSTOMS COLLECTIONS

The total revenues collected in 1944 by the Customs Service, including collections for other departments and Puerto Rico collections other than duties, amounted to $561,101,058, a decrease of 22.8 per cent from the 1944 total ($727,251,316) which was the highest in customs history. Of these totals, $201,890,315 in 1945 and $292,019,928 in 1944 represented internal revenue taxes collected by customs officers on imported distilled and vinous liquors, a decrease of 30.9 per cent.

Customs duties alone yielded $354,741,316 in 1944, a decline of 17.8 per cent from the previous year's duty yield ($431,310,620), which had been exceeded only nine times in the country's history—in 1937 and in the eight successive years from 1923 to 1930 inclusive. From a low of $23,147,000 in August 1944 (the lowest since November 1942), duty collections climbed steadily and almost continuously to a peak of $35,806,583 in May, suffering only a sharper decline than usual in the short month of February and the customary seasonal decline in June.

Reduced collections from consumption entries and warehouse withdrawals, the two most important types of entries, in the greatest measure accounted for the lower total of collections for the fiscal year. A greater volume of tourist travel was reflected in increases in duties collected on baggage and informal entries. The amount of duties collected on mail entries increased slightly, although the number of mail entries was less than during the preceding year.

SOURCES OF CUSTOMS REVENUE

In order of importance, wool, alcoholic beverages, and agricultural products provided the greatest sources of customs revenue in 1945. Collections on sugar and sugar products, one of the three major sources of revenue in 1944, declined sharply during the past year from $55,040,910 to $10,319,515, or 82.3 per cent. This situation was induced by Executive Order 9177, which permitted free entry of most sugar imports during 1945, with the

result that imported cane sugar yielded less than one-sixth as much revenue in 1945 ($8,578,683) as in the previous year ($53,286,873). This decrease, together with smaller collections from wool and alcoholic beverages, more than accounted for the entire recession in customs revenue during 1945.

With the moderating of previous restrictions on the production of alcoholic beverages, imports declined sharply and liquor duties were correspondingly reduced in 1945 to but 55.5 per cent of the total for the peak year of 1944. Nevertheless, 1945 collections on such imports exceeded by 19.9 per cent the duties collected on alcoholic beverages in 1937, the high year prior to 1944. The agricultural products schedule exhibited the largest absolute increase over 1944 ($14,357,825) the result of greatly increased importations of corn, oats, wheat, potatoes, apples, and almonds. Manufactures of rayon or other synthetic textiles, although a relatively minor source of revenue, also yielded a pronounced increase over the preceding year in that duty collections on such imports rose from $118,066 in 1944 to $264,562 in 1945, an increase of 124.1 per cent.

The impact of the war on our foreign commerce is even more graphically reflected in the territorial sources of customs revenue, than in the commodity sources. Naturally enough, duties on imports from Europe and Asia shrank as the war progressed. In the case of Europe, the decline was continuous from 1938 to 1943, and after a slight up-turn in 1944 a new low was reached during the past year. In the case of Asia three years of successive declines from 1941 to 1944 were followed by a slight increase in revenue in 1945.

Europe's decline in importance as a source of revenue was proportionate as well as absolute, 47.6 per cent of customs revenue being derived from duties on European goods in the last year before the war (1939) and only 17.4 per cent in 1945. Duties on imports from three of the neutral countries in Europe, however, skyrocketed during the war, the combined total for Switzerland, Spain, and Portugal amounting to $37,317,000, (62.7 per cent of the European total) in 1945 compared with $13,030,000, (8.8 per cent of the total) in 1939. In fact, these three countries, together with the United Kingdom, accounted for 98.1 per cent of the 1945 total for Europe compared with 35.9 per cent in 1939. The 1945 up-turn in duties on imports from Asia was owing to increased collections on merchandise from Turkey, British India, Iran, and the Levant.

With collections on imports from Europe and Asia progressively declining, the portion of the world not blockaded or overrun by opposing armies furnished much more of our imports than before the war and consequently was the source of greatly increased revenues. Duties from imports from North and Central America rose from $69,006,000 in 1939 to $117,008,000 in 1944 and receded $116,637,000 in 1945. Duties on imports from South America in 1945 were more than doubled, those on African products almost trebled, and those from Oceania eight times the 1939 collections. The decline during the past year in the collections on North and Central American goods was owing to the smaller imports of alcoholic beverages and to the admission of a great deal of sugar duty free. A very considerable portion of the duties on imports from South America, Oceania, and Africa was derived from the continued heavy imports of wool.

VOLUME OF BUSINESS

The number of entries of merchandise constitutes one of the non-fiscal activities of the Customs Service which serves as an index of the trend of trade. Even with the decline in duties of consumption entries the number of such entries showed a slight

---

[1] Taxes collected on dutiable commodities under the revenue acts and the Sugar Act of 1937 are included in appropriate schedules.

increase, a preview of what can be expected when the shipping lanes are no longer clogged with the implements of war. The number of baggage and informal entries, on the other hand, increased very sharply as tourist travel bulged with the moderating of restrictions previously maintained. Vehicular and vessel movement also increased sharply during 1945, this being the fourth consecutive year to show an increase in border traffic. The only declines in border traffic were recorded in the number of passenger trains and freight cars which entered the country. Airplane traffic on international lines continued to increase for the 14th consecutive year. The expansion during 1945 was greater, both relatively and absolutely, than for any previous period. The number of airplanes arriving from abroad being almost double and the number of passengers arriving by plane more than double that of 1944.

SEIZURES

The number of seizures for the violation of customs laws were more numerous than during the previous year owing in part to the shortage of certain materials in the United States which provided an incentive to smuggling and in part to the increased tourist travel and to the return of Army and Navy personnel from abroad. The value of seizures of cigarettes in 1945 was six times that of the previous year, and the value of guns and ammunition seized 12 times that of 1944. Narcotic and liquor seizures on the other hand were fewer in number than in 1944. The small importance of seizures of narcotics was owing not only to the breaking up of smuggling rings by the efficiency of enforcement officers but also to the small number of vessels arriving from Oriental ports. The decline in seizures of liquor coincided with an increase in quantity and quality of domestic supplies of alcoholic beverages.

MERCHANDISE ENTRIES

RAILROADS

By John J. Pelley
President, Association of American Railroads

WAR FACTORS

From a railroad standpoint, the year 1945 was in many respects the most difficult of the entire war period. Bad weather conditions in the northeastern area in January and February, continuing shortages in manpower and materials throughout the year, the peak movement of war goods to the ports up to VE-Day, and the sharply increased movements to West Coast ports up to VJ-Day, the highly concentrated return movement of troops which began in June, and record grain loadings were the principal factors affecting railroad operations in 1945.

For the year as a whole, traffic was slightly below the all-time peak levels of 1944. Freight carloadings declined by 3½ per cent; freight ton-miles were less by 8 per cent; passenger-miles decreased by 5 per cent. Trends in both freight and passenger service varied sharply during the year. Compared with the corresponding period of the preceding year, ton-miles showed a decrease of 1.5 per cent up to VE-Day, a decrease of 4.6 per cent between VE-Day and VJ-Day, and a decline of about 18 per cent from VJ-Day to the end of the year. Passenger-miles, on the other hand, showed a reverse trend, declining 8.7 per cent in the first period, and 5.1 per cent in the second, but showing a small increase in the third.

FINANCIAL STATUS

From a financial standpoint, comparing the 12-month period ended Oct. 31, 1945, with the calendar year 1944, operating revenues declined 3 per cent; operating expenses increased 5½ per cent; net railway operating income decreased 11 per cent; the rate of return on property investment was 3½ per cent; net income after interest and other fixed charges declined 13 per cent. The year 1945 was the third consecutive year of decline in net earnings.

Traffic and financial statistics will be shown in some detail at a later point herein. Other principal developments during the year are discussed briefly below.

EMPLOYMENT AND WAGES

Employees of Class I railroads in 1945 numbered 1,422,000 and earned $3,925,000,000 in wages and salaries. The number of employees increased about one-half of one per cent over the preceding year, while their aggregate earnings rose nearly 2 per cent. The average compensation per employee per year was $2,760, the highest in history. The average hourly straight time rate of pay in 1945 was 93.3 cents, also a new high. The various brotherhoods and unions representing railroad employees filed demands in 1945 for substantial increases in rates of pay and for certain changes in working rules. The wage increases requested would, if granted, cost the railroads $1,205,000,000 per year, based on 1944 employment. Including proposed changes in rules, the overall demands would amount to increases of more than $2,000,000,000 in railroad operating costs. The demands were in the conference stage at the year's end.

MEXICAN WORKERS AND OTHER MANPOWER FACTORS

Under the agreement between the United States and Mexican governments, a maximum of 75,000 Mexican nationals were authorized for importation into this country in 1945 for railroad track work. These men were recruited in Mexico by the Railroad Retirement Board at the beginning of the railroad maintenance season and were brought into this country under six-month contracts as rapidly as transportation facilities permitted. Shortly after VJ-Day, the War Manpower Commission ordered further recruitment stopped, and also forbade renewals of contracts with Mexican nationals already at work in this country. The workers are being released and returned to Mexico as rapidly as conditions will permit.

As in the two preceding years, railroads were seriously short of manpower in 1945. While the situation eased somewhat following VJ-Day, the abrogation of the Mexican program, as well as continuing high labor turnover rates, made the problem a difficult one throughout the year. Thousands of women were continued in unusual and unaccustomed occupations to help offset the shortages.

OFFICE OF DEFENSE TRANSPORTATION

Shortly after VJ-Day, the Office of Defense Transportation began to curtail its activities. This agency rescinded many of its wartime orders, and others will be eliminated as soon as conditions warrant. The number of persons employed by ODT was reduced to about 90 at the end of 1945, compared with a maximum of about 5,000 at the peak of the war period. For the period since VJ-Day, the attention of the Office has been directed primarily to the movement of troops returning from the European and Pacific areas. Director J. Monroe Johnson announced that June 30, 1946 is the tentative date set for the termination of ODT's activities.

RATES AND FARES

There were no changes in 1945 in the general levels of freight rates and passenger fares. The freight rate increases authorized early in 1942 and suspended on May 15, 1943, were continued in suspension by order of the Interstate Commerce Commission "until a date 6 months after the legal termination of the war." The 10 per cent increase in passenger fares authorized in 1942 have continued in effect since that time but will automatically expire six months after the legal end of the war. That date has not yet been determined. By an order handed down on May 15, 1945, the I.C.C. ordered an increase of 10 per cent in class rates in official (eastern) territory and a decrease of 10 per cent in such rates in other territories east of the Rocky Mountains. This was an interim measure to apply until a uniform freight classification and class rate structure applicable to the country as a whole could be worked out. The effective date of the interim adjustment was to be Jan. 1, 1946. However, on Dec. 21, 1945, the Federal District Court in northern New York granted an interlocutory injunction enjoining enforcement of the order, and the Commission has indefinitely postponed the effective date.

GEORGIA RATE CASE

On March 26, the United States Supreme Court assumed original jurisdiction in the Georgia Rate Case and authorized the state to file a bill of complaint alleging violation of the Federal anti-trust laws by certain railroads. The Court appointed a Special Master to submit findings of fact and conclusions of law, together with a recommended decree.

RAILROAD ANTI-TRUST SUIT

The Federal District Court in Lincoln, Neb., denied the motion of the Association of American Railroads and others to dismiss the Government's anti-trust suit instituted in 1944. Motion for a bill of particulars was sustained in part, and March 3, 1946, was set as the date for filing.

ARIZONA TRAIN LIMIT LAW

On June 18, the Supreme Court declared the Arizona Train Limit Law to be unconstitutional. That state law, which had been in effect since 1912, limited the length of freight trains operated in Arizona to 70 cars and passenger trains to 14 cars. Enforcement of the law was suspended by order of the Interstate Commerce Commission during the war period.

PULLMAN COMPANY CASE

Toward the close of the year a Special Federal Court in Philadelphia approved the offer of a group of railroads to buy the sleeping car business of the Pullman Company. The court had before it a number of other offers from interests outside of the railroad industry. The Pullman Company had been ordered by court action to dispose of either its sleeping car business or its car manufacturing activities. The company chose to sell its sleeping car business.

LEGISLATION

A number of bills of importance to the railroad industry were introduced in the 1945 session of Congress. The Boren Land Grant Act (Public Law 256) was the only bill of major importance to the railroads to be enacted before Congress concluded its work for the year. The new law repeals the reduced rate provisions contained in the old railroad land grant acts, some of which have been in effect since 1850. The effective date of the repeal is Oct. 1, 1946.

Hearings on bills proposing extensive and far-reaching changes in the Railroad Retirement and Unemployment Compensation Acts were held in 1945 before both houses of Congress. Railroad employees appeared in support of the measures, while railroad managements opposed them. Among other things, the bills would incorporate into the present retirement and unemployment compensation systems a new feature embodying non-occupational sickness and accident insurance.

On Dec. 12, the House of Representatives passed the Bulwinkle bill. That bill would stay the operation of antitrust laws with respect to carrier agreements approved by the Interstate Commerce Commission. Enactment of the bill would clarify a situation that for the past several years has been highly confusing. These and other bills of lesser importance which received some attention in 1945 will be brought to a conclusion, one way or the other, in 1946.

RAILROAD TRAFFIC

The year 1945 closed another era in American history. From the standpoint of production and industrial achievement it was the greatest yet experienced. The country was not ready for war when it came, but once the emergency became apparent American industrial genius met the challenge with a record output of war goods and supplies.

It will ever stand to the credit of the railroad industry that it kept pace with other industries and met with adequacy and efficiency every demand made upon it in behalf of the war effort. At the outbreak of the war period the industry had been through 10 years of sharply reduced traffic and earnings, a result in part of the economic depression that prevailed throughout the 'thirties and in part of the devastating effects of government-aided competition from highway, inland waterway, and air carriers. Yet when the crisis came the railroads responded by performing two-thirds again as much freight service as they had ever been called upon to do before and more than twice as much passenger service. This they did with far less equipment and far fewer employees than had been available to them in earlier periods of heavy traffic volume. Shortages in steel and other critical war materials made it imperative for the railroads to do the job with minimum additions to equipment and other facilities.

The following table gives statistics

FREIGHT AND PASSENGER TRAFFIC, EQUIPMENT AND EMPLOYMENT RAILWAYS OF CLASS I IN THE UNITED STATES

	Freight Ton-Miles (000,000)	Passenger-Miles (000,000)	Number of Equipment Units			No. of Employees (000)
			Locomotives	Freight Cars (000)	Passenger Cars	
1945*	680,000	91,000	43,725	1,805	37,600	1,422
1944	737,246	95,549	43,612	1,794	37,837	1,415
1943	727,075	87,820	42,731	1,781	37,940	1,355
1942	627,984	53,659	42,033	1,769	38,051	1,271
1941	475,072	29,350	41,771	1,725	37,897	1,140
1940	373,253	23,762	41,721	1,675	37,817	1,027
1939	333,438	22,651	42,511	1,671	38,427	988
1933	249,223	16,341	50,903	2,061	46,510	971
1929	447,322	31,074	57,571	2,307	52,259	1,661
1920	410,306	46,849	64,746	2,351	53,501	2,023
1918	405,379	42,677	63,889	2,354	53,941	1,842

* Partially estimated.

of railroad traffic, equipment and employment during the war period just ended. For comparative purposes, data for 1918, the peak year in the First World War, and 1920 and 1929, years of pre-war peaks in passenger and freight traffic, respectively, are shown.

Compared with 1939, the year in which the war started in Europe, freight ton-miles in 1945 showed an increase of 103 per cent and passenger-miles increased 302 per cent. This traffic was handled with increases of only 3 per cent in the number of locomotives, 8 per cent in the number of freight cars, and 44 per cent in the number of employees. The number of passenger-train cars actually declined by 2 per cent.

Compared with pre-war years of peak traffic volume, such as 1929, 1920, and 1918, both freight and passenger traffic in 1945 showed very substantial increases, yet equipment ownership and employment showed very marked decreases.

Traffic increases on the railroads during the past five years were owing to both direct and indirect war causes. Early in the war period the Panama Canal was closed to commercial traffic and the freight normally handled by boats operating in intercoastal service shifted to inland rail routes. Most of the tankers that operate from Gulf to Atlantic ports, and supply the East Coast area with petroleum, were transferred to foreign duty early in 1942 and that traffic also was shifted to rail haul. Many general cargo vessels operating in coastwise service were also transferred to direct war uses. Shortages in tires and gasoline limited the amount of service performed by motor vehicles, particularly private passenger automobiles. These and other necessarily curtailed services by peacetime modes of transport added substantially to the war-swollen volume of goods and passengers on the railroads.

The war traffic pattern began to change shortly after VE-Day when some cutbacks in war production were made. However, from the standpoint of the railroads, this was largely offset by the long hauls involved in moving increased numbers of men and quantities of war goods to West Coast ports, as well as the start of the return movement of men from Europe. Further changes in the traffic pattern occurred following VJ-Day. Tankers were returned to Gulf-Atlantic and other routes, while gasoline rationing was lifted. On the other hand, heavy relief programs for inhabitants of war torn areas necessitated a considerable movement of goods to the ports, while the return of men from all war areas was speeded up. Many war influences will affect rail traffic in 1946, but to a diminishing degree.

RAILROAD EFFICIENCY

Railroad cars and trains were more heavily loaded during the war period than ever before. Cars and locomotives averaged more miles per day, while

* 10 months ended Oct. 31.

the output per hour of train operation reached a new high. Some of the outstanding performance averages are given in the foregoing table.

In achieving these record performance levels, the railroads received whole-hearted and understanding cooperation from shippers throughout the country, from the Army and the Navy, from the Office of Defense Transportation, from the Interstate Commerce Commission, and from other government agencies. Without such cooperation the biggest moving job in history could not have been done. Also, the traveling public generally accepted with good-natured understanding the crowded conditions on many passenger trains, recognizing that critical war materials could not be spared for construction of new passenger equipment and that a large part of existing equipment was in constant troop service.

FINANCIAL RESULTS

Railroad operating revenues during the war period reflected the great increases in traffic volume. To a lesser extent, net earnings also reflected such increases. Heavy tax accruals, as well as wage rate increases and higher prices paid for fuel, materials, and supplies, absorbed a considerable part of the larger gross.

The adjoining table shows the principal income account items over a period of years. The entries for 1945 apply to the 12-month period ended Oct. 31 of that year. Because of the difficulties in foreseeing tax and other adjustments in the last two months of the year, no attempt has been made here to estimate results for the year as a whole.

From the standpoint of net earnings, the year 1942 was the best of the war period. Notwithstanding further increases in operating revenues after 1942, which amounted to about $2,000,000,000, 1944 compared with 1942, net earnings declined in each year.

Compared with 1942, railway operating revenues in the 12-month period ended Oct. 31, 1945, increased 22.5 per cent, operating expenses increased 43.9 per cent, and taxes increased 14.8 per cent. On the other hand, net railway operating income declined 33.8 per cent, and net income after fixed charges decreased 35.8 per cent.

Railroads continued in 1945 to reduce outstanding indebtedness, as well as to reduce annual interest charges through refinancing at lower interest rates. In the five years ended with 1945, solvent railroads reduced outstanding funded debt by more than $1,000,000,000, while annual interest charges were reduced by more than $50,000,000.

Railroads spent in 1945 about $500,000,000 in gross capital expenditures for additions and betterments to properties. This compares with an expenditure of $560,112,000 in 1944. The decline was owing primarily to the

installation of fewer new locomotives in 1945. In the first 10 months, 74 new steam and 448 new Diesel locomotives were installed in service by Class I railroads, compared with 287 new steam, 495 new Diesels, and one new electric locomotive in the same months of 1944. New freight cars installed in the first 10 months of 1945 numbered 33,696, compared with 30,832 in the same period of 1944.

CONCLUSION

As the year 1946 opens, a start has been made in the transition from war to peace activities. However, it is only a start and much remains to be done before the goal is achieved. Many millions of our people have been or will be sharply affected by the readjustment process.

The railroad industry has not yet completed its wartime assignments. Early returns indicate that the month of December, 1945, was the all-time peak in the handling of organized troop movements on the railroads, and the demobilization process will require another six months or so to complete. Likewise the movement of grain, other foodstuffs, and coal to the ports for shipment to devastated countries abroad has been heavy and will remain so until those countries again become self-sufficient for food and fuel.

On the other hand, railroads have already begun to prepare for the demands of peacetime traffic. Some new equipment has already been ordered, while plans for additional cars and locomotives are well advanced. The primary objective is to offer the most efficient, most complete, most attractive, and most economical services in the history of transportation.

HIGHWAYS

By Thomas H. MacDonald
Commissioner of Public Roads, Federal Works Agency

WAR AND POST-WAR DEVELOPMENTS

Development of plans for a $3,000,000,000 post-war highway program, to extend over a three-year period, held the spotlight in the highway construction field in 1945.

Suspension of the normal Federal-aid program during the war years had resulted in a sharp curtailment of highway activities. Men, materials, and machines were available only for projects urgently needed for war purposes. Improvement of highways in the vicinity of war industries and training areas and construction of access roads to sources of raw materials continued in substantial amount in 1945, but work of this type had passed its peak in the preceding year.

Wartime restrictions on road building operations were removed shortly after the end of hostilities, but approach of winter, readjustment from war conditions, and other factors prevented a general resumption of highway work immediately. In every state, however, steps were taken to get post-war projects under construction as quickly as possible. In many states, during the closing months of the year, contracts were let for highway and bridge work that had been deferred during the war years.

HIGHWAY PLANNING

Interest in planning a post-war highway program was strong at the beginning of the year, and planning activities were intensified as successes of the allied armies gave promise of an early cessation of fighting.

A large post-war highway program offered advantages beyond the transportation field by providing employment and stimulating business activity in the readjustment period. Since the industry of the country was wholly converted to war, the importance of developing plans for a highway program that would be ready for launching at the end of the war was generally recognized.

Passage of the Federal-Aid Highway Act of 1944 on Dec. 20 of that year prompted the states to prepare large programs for the improvement of urban highways, principal rural highways, and secondary roads, to be financed with Federal-aid and other highway funds.

The Federal-Aid Highway Act of 1944 established the pattern for the post-war highway program, specified the amount of Federal aid that would be made available, and removed all uncertainty as to the character and extent of the program.

Near the end of the year the states had completed plans for post-war highway projects estimated to cost $647,000,000. Plans for improvements to cost $2,500,000,000 were under way, and plans for additional work, extending over a period of years and calling for expenditures of $1,333,333,000, were contemplated.

These figures cover the total planning of state highway departments including Federal-aid projects. In the planning stages of a project it often happens that decision is not made as to whether Federal funds will be used to finance the cost of construction.

HIGHWAY LEGISLATION

Provisions of the Federal-Aid Highway Act of 1944 are based upon recommendations contained in the report of the National Interregional Highway Committee, which was submitted to the Congress by the President on Jan. 5, 1944, and the program of highway improvements advocated in the report "Toll Roads and Free Roads," which was prepared by the Public Roads Administration in 1939 after a detailed study of highway conditions throughout the country.

The act authorized a Federal appropriation of $500,000,000 to assist the states in making highway improvements in each of the first three post-war fiscal years. It provided that $225,000,000 should be appropriated for expenditure on rural and urban sections of the Federal-aid system; $150,000,000 for the improvement of farm-to-market roads and other secondary routes; and $125,000,000 for work on sections of the Federal-aid system in urban areas.

Conforming in effect to the recommendations of the National Interregional Highway Committee, the act required the designation of a National System of Interstate Highways not exceeding 40,000 miles in extent. The proposed system was to be selected by joint action of the state highway departments and the Public Roads Administration.

The act further provided that the new system, when designated, would become part of the Federal-aid highway system and consequently would be eligible for funds provided for improvements on both rural and urban sections of the latter system. No funds were earmarked solely for the development of the National Interstate System.

TENTATIVE MAPPING OF THE INTERSTATE SYSTEM

Funds for the first post-war fiscal year were apportioned on Jan. 6, 1945, and in February each state highway department was requested to proceed at once with the task of selecting routes recommended for inclusion in the National Interstate System. Attention was directed to the system recommended by the National Interregional Highway Committee but it was made clear that the Public Roads Administration intended in no way to limit the freedom of action of the states in selecting routes for tentative designation.

At the end of the year maps showing recommended routes had been submitted by all the states. In general, the recommendations coincided closely with the Interstate System proposed by the National Interregional Highway Committee. A different routing was proposed for some sections, and a number of additional routes across states were recommended. Total mileage recommended for inclusion in the system considerably exceeded the legal limitation of 40,000 miles.

In several instances the proposed

routes did not connect at the state line with a proposed route in the adjoining state. Under the provisions of the law it is necessary that each state highway department consider not only the internal needs of the state but also that it act jointly with highway departments of adjoining states to select a connected system.

After a detailed study by the Public Roads Administration, with particular reference to the probable service the proposed routes will render to industry, to the national defense, and to highway users in general, a tentative integration of the routes recommended by the states will be referred to the state highway departments for further consideration, with a view to eventual agreement on the National Interstate System as a whole.

The National Interstate Highway System being planned ultimately will connect all our large cities and densely populated industrial areas with broad, modern highways over which traffic will flow freely. It will pass directly through our largest cities on express routes. Access to express routes will be permitted only at selected points.

Circumferential and distribution routes within and around the larger cities also will be provided. The total mileage of these circumferential routes may aggregate several thousand miles, and this must be taken into account in selecting the system.

SECONDARY ROADS

The Federal-Aid Highway Act of 1944 authorized an appropriation of $150,000,000 for improvement of farm-to-market roads, mail and school-bus routes, and other secondary or "feeder" roads. The funds will be available for expenditure on a system of such roads selected by the highway department in each state, in cooperation with county supervisors or other appropriate local road officials and the Public Roads Administration.

The improvement of secondary roads was well advanced in many states and begun in others prior to the war. Under earlier legislation, Federal-aid secondary road systems or partial systems had been selected and approved for 35 states.

The new legislation requires that a system of Federal-aid secondary roads be selected in all states except the few in which all public roads and highways are under the control of the state highway department.

The objective of the legislation was to initiate a more comprehensive rural road program through the selection and improvement of a system of principal secondary roads to supplement the Federal-aid highway system in rural areas. Together, the two systems will form a closely integrated network of trunk routes and "feeder" roads.

No specific limit was placed upon the mileage of secondary road systems, but the states were urged to include only such mileage as could be adequately improved within a reasonable period of years and maintained with revenues that may be expected to accrue.

STANDARDS OF DESIGN

A statement of policy and procedure in designating secondary road systems was issued by the Public Roads Administration in May. Subsequently the standards to which secondary roads should be improved were the subject of careful study by all highway officials concerned, and appropriate recommendations for designing and constructing such roads were approved.

It is not necessary to build secondary roads to the high standards required by the large volumes of traffic on Federal-aid and state highways. It is necessary, however, that secondary roads be designed to give year-round service, and they must have sufficient durability to be maintained at reasonable cost.

No single type of construction meets these requirements in all situations. Traffic volumes, climatic conditions, and construction materials will vary greatly on different parts of the secondary road systems, but durable roads will be built.

Both the headquarters staff and the field organization of the Public Roads Administration cooperated actively with the states and their subdivisions in preparing for the post-war highway program. Data from the pre-war state highway planning surveys indicated the course to follow in rural highway work, but the absence of similar data for urban areas has been felt in developing solutions for city problems.

In most of the larger cities it has been necessary to bring together representatives of Federal, state, and city agencies interested in highway work, as well as representatives of adjacent areas not a part of the city, to agree on concerted action in developing plans for proposed improvements. The Public Roads Administration has assisted in the organizational steps, in the preparation of preliminary reports for public discussion to crystallize opinion as to an acceptable general plan, and in the preparation of detailed designs for adopted routes.

TRANSPORTATION STUDIES

Surveys of travel habits, using a new home-interview technique similar to the method employed in conducting public opinion polls, have been made in urban areas varying in size from 30,000 to nearly 2,000,000 population.

These studies of traffic origin and destination provide an accurate means of estimating the volume of traffic that will use any proposed route, thus indicating the urban routes that should be selected for improvement. They also serve to evaluate the merits of proposals advanced by different groups within an urban area, and to bring together the various local agencies in support of a single plan.

The Public Roads Administration has assisted in initiating and conducting comprehensive transportation studies, using the home-interview method, in 38 metropolitan areas. The field work in many of these surveys had been completed at the end of the year.

FEDERAL HIGHWAY ACTIVITY

During the fiscal year ended June 30, 1945, 4,011 miles of highways of all classes were completed, as compared with 5,695 miles in the preceding fiscal year and 12,936 miles in 1941. Nearly all the work was done with state cooperation. Completed highways consisted of 3,302 miles of access roads to war establishments of various kinds, 462 miles of roadway in the strategic network, and 247 miles of miscellaneous construction required by the war effort.

Twenty-one railroad crossings were eliminated, two obsolete structures were reconstructed, and 54 crossings were protected by signals or other devices. The total cost of all completed work was $111,062,750, of which $89,425,842 or 80 per cent was paid by the Federal Government. Approval of new projects fell to a new low level of 2,730 miles, as compared with 11,270 miles in the fiscal year 1941.

NATIONAL FORESTS AND PARKS

Construction of highways in national forests and parks was almost entirely suspended during the war years. A few roads of particular importance in reaching mineral deposits and timber needed for war purposes were improved, but generally the work was only that required for logging and ore-hauling operations.

Considerable work was done, however, on surveys, soil investigations, preparation of plans and specifications, and the development of a broad program of post-war improvements for which funds were authorized in the Federal-Aid Highway Act of 1944. This act authorizes an appropriation of $25,000,000 for the improvement of national forest highways, $4,250,000 for national park highways, and $10,000,000 for parkways, for each of the first three post-war fiscal years.

The Department of Agriculture appropriation bill for the fiscal year ending June 30, 1946, provides an appropriation of $1,500,000 for the maintenance and reconstruction of forest highways.

Plans and specifications have been prepared for projects that will absorb all national park and forest highway funds and funds for parkways for the first post-war fiscal year. Construction began in the spring of 1946.

INTER-AMERICAN HIGHWAY

Work on the 3,300-mile highway from the Texas border to Panama continued during the year, but only at a moderate pace. At the end of the year, 2,487 miles had a surface suitable for automobile travel at all seasons of the year, and 280 miles was passable in dry weather. Impassable gaps in Mexico, Honduras, Costa Rica, and Panama totaled 567 miles. The gap in Honduras is only eight miles long, and a bypass is in use.

An all-weather road exists from the United States border to a point about 50 miles south of Oaxaca, Mexico, a distance of 1,140 miles. From Oaxaca south, Mexico has pushed the improvement as fast as wartime conditions would permit, but travel to the southern border of Mexico is not yet possible.

Planning of the Inter-American Highway is an international undertaking, but each country through which it passes is in full control of financing and constructing sections within its borders. All work in Mexico has been done without outside assistance. Sections in other countries have been financed by the government of the country, with engineering assistance provided by the United States.

The United States has aided in financing some of the projects, and currently assistance is being provided from a $20,000,000 fund authorized by the Act of Dec. 26, 1941. Financial assistance from this country is limited to two-thirds of the cost.

PAN-AMERICAN HIGHWAY

This highway coincides with the Inter-American Highway to Panama and extends down the west coast of South America, across the Andes to Buenos Aires, and northward to Rio de Janeiro. The section from the Colombia-Panama border to Buenos Aires is 8,097 miles in length. Little has been done during the year in developing other sections of the Pan-American Highway, beyond local improvements. More extensive improvements will have to be made and gaps closed before tourist travel will be advisable. Near the end of the year, Ecuador awarded a contract for the construction of a difficult section through the Andes Mountains.

THE MOTOR BUS INDUSTRY

By Carl W. Stocks
Editor, *Bus Transportation*

GENERAL

Throughout the early part of 1945 the motor bus industry struggled on with the problems hanging over from the preceding war years. The selective service continued to draw heavily on the industry's manpower supply, while the supply of tires, replacement parts, and fuel continued to shrink owing to the growing needs of the armed forces which at that time were engaged in some of the severest fighting of the war. Buses were getting war worn, and constantly needed more attention in order to keep them in service, while new buses were in short supply and were under allocation by Office of Defense Transportation to those carriers that could prove absolute need in essential services.

Then came the end of hostilities which by no means took the pressure off the motor bus lines. The subsequent easing of controls was, however, a tremendous step forward, but even at the end of the year carriers were still hampered by shortages of materials and supplies. While new buses are rolling off the manufacturers' assembly lines in greater volume than for the past three years, the number was insufficient to meet the demand of the carriers for new and modern equipment.

TRAFFIC VOLUME FACTORS

While some decline in traffic occurred in the early months of the reconversion period, the continued shortage of automobile production, notwithstanding the end of gasoline rationing, had little effect on the volume of traffic handled for the full year of 1945. Only the city lines showed a decrease in traffic for the year; the city-suburban and the intercity carriers both showed a continued upward trend. Riding, therefore, continues on a high level with every prospect that that level will be maintained at least into the second quarter of 1946. So the bus industry as a whole goes into the new year with prospects substantially better than for industry as a whole, even though both are beset with labor demands for higher wages and a shorter work week. Some strikes have interrupted operations. Both city service and intercity carriers have been affected. No one section of the country has been strike free.

One of the most promising aspects of the industry for the last half of 1945 was the ability to secure a substantial number of new buses from manufacturers and prospects are good for further betterment in new equipment deliveries for the year 1946.

BUS PRODUCTION AND SUPPLY

Soon after the end of hostilities in Europe the bus manufacturers were given the "go-ahead" to build all the buses they could, but priority orders for deliveries as set up by ODT had to be filled before carriers not on the list could secure new equipment. Despite the fact that all manufacturers did not get their production under way fully before the end of the year, and the strike at General Motors, which made deliveries by them impossible during December, the bus industry absorbed 9,400 new buses and 225 new trolley buses for line haul service, and the schools themselves and the school bus contractors 8,200 more.

For the year 1945 the line haul carriers handled 9,742,000,000 passengers on buses and 894,000,000 on trolley buses. Of this total, the intercity motor bus carriers handled 1,092,000,000. Not all of the passengers on the intercity lines rode long distances, for during the war these carriers had built up a large commuter business and also a substantial volume to army camps and bases to which service was given. Local transport companies handled more than 9,500,000,000 revenue producing passengers during the year, exclusive of the riding on free transfers, passes, and in charter service.

To handle this immense volume of traffic, the intercity carriers had 31,250 buses and the local transport companies 50,625 buses and 3,169 trolley buses. These so-called common carrier buses rolled up 3,279,000,000 miles during the year. The local transport companies accounted for 1,605,000,000 miles by buses and 114,000,000 miles by trolley buses, while the buses of the intercity carriers rolled over 1,500,000,000 miles. It is impossible to further subdivide the operations as between line service and charter or off-route services, other than to state that they represent but a small percentage of the total, in as much as ODT restrictions were not lifted until the beginning of the fourth quarter of the year. Prior to that time no charter service outside of government work was permitted.

Based on information covering nine months operations for the year 1945, city companies now have 2.274 motor buses for each mile of line over which service is given. Those serving both city and suburban areas have 1.093 buses per mile of line, and trolley bus operations indicate an average of 3.325 vehicles per mile of line. The intercity carriers as a unit have one bus for each 14 miles of line. On the major lines, the intercity carriers are rolling up mileage at the rate of 76,000 bus miles per year, while in local transport service the rate is somewhat lower, being approximately 31,000 for the year.

OPERATING REVENUES AND COSTS

Operating revenues per bus mile are currently running higher than in any similar previous period, with intercity carriers taking in 43.87 cents per bus mile, while the city bus lines and the city-suburban operations range from 41.66 to 41.50 cents respectively.

While bus mile revenues are greater, operating costs also have shown a rapid rise, with the result that the ratio between operating costs and operating revenues is tending to go higher. This is to be the expected result from higher wages and higher material costs unless there can be an equivalent gain in operating revenues. For the nine months period, operating costs, exclusive of depreciation charges, taxes chargeable to operations, and rents were 27.08 cents per bus mile for city companies, 27.49 cents for city-suburban operations, and 22.84 cents for the intercity carriers. These higher operating costs when coupled with taxes, depreciation charges, and rents will indicate that net operating revenue is decreasing, and even though income taxes are less the net profit per bus owned from operation is less, except in the intercity group of carriers, than for the nine months period of 1944.

For the year 1945 it is estimated that operating revenue for the line haul bus companies, including charter or off-line service operated will be $1,220,000,000. This is the third consecutive year that the industry has had an operating revenue of more than $1,000,000,000. A breakdown of these figures credits $576,000,000 to the intercity carriers, and $644,500,000 to the local transport companies. In addition, the trolley bus operations had a revenue of $62,000,000. Net income for the bus companies after all taxes totaled $11,200,000 and was divided: $56,200,000 for the intercity group of carriers and $55,000,000 for those engaged in local transport service. Trolley bus operations enjoyed a profit of $10,000,000.

BUS PRODUCTION

Considering the many obstacles which had to be surmounted, the production of 18,450 buses of all types during 1945 was an achievement which came near equaling the highest bus production in the history of the industry. The largest total bus production ever reached in a single year was in 1939 when 19,655 vehicles were put into service. Classification of the production for 1945 shows 9,416 buses were absorbed by the common carrier services; 5,908 by the local transport companies and 3,508 by the intercity carriers. School buses totaled 8,225 units, and the armed forces received 799 units. Miscellaneous units and trailers total 10. In addition to these motor buses, 229 trolley buses were delivered during the year to carriers in the United States and 36 more exported to Canada and other countries.

It is interesting to note that the 9,416 common carrier bus production figure slightly exceeds the bogie of integral type units allocated to manufacturers by ODT for 1945 production. The ODT allotment for 1945 was for 9,413 integral type and 12,700 body or chassis type buses. Except for the 8,225 school buses, which were principally of the body-on-chassis type, the majority of vehicles built in 1945 were of the integral or unit construction type.

Buses built in 1945 were of larger average seating capacity—33.8 passengers—than those built in any previous year except 1942, when the average seating capacity was for 34.9 passengers. Intercity type vehicles in 1945 had an average seating capacity of 34.1, while city type buses had accommodations for 33.5 seated passengers.

SCHOOL BUS OPERATIONS

A survey of school bus operations for the school year 1944-1945 disclosed that, despite a decrease in the number of schools using buses, almost 300,000 more pupils were handled daily. The number of buses in school service is estimated at 80,000 over and above those used by line haul companies in this service. This is a gain of 5,000 buses for the year.

School buses now serve 40,000 schools, carry 4,700,000 pupils daily, and operate over 1,725,000 miles of route at a cost of $93,500,000 to the states. Direct comparison of costs for the school year 1945-1946 can be expected to increase by at least 7.7 per cent. Real need exists for many new buses to replace school buses now in service. The conditions under which school buses have had to operate during the last few years have taught the authorities a great deal about conserving the life of the vehicle. Moreover, the authorities responsible for school bus services have learned a great deal about reducing the service to essentials. One thing is certain, it is unlikely that in the future there will be any school bus service merely for convenience.

Again, on the constructive side, local officials, state school authorities, and others have all worked together more closely than ever before. In short, it may be said that operation of the school bus under wartime conditions has served to teach the school authorities a number of lessons that only the stress of war could be expected to bring to the surface. Lessons learned the hard way are not likely soon to be forgotten.

CHANGES IN OWNERSHIP

As in previous years there was a noticeable shift in ownership in the operating field, some of which was forced by the Securities and Exchange Commission. Mention can be made of the break-up of the city companies at Richmond, Norfolk, and Newport, Va., the sale at Portland, Ore., and at Dallas, Tex. In Chicago the city pushed its plan to acquire the Surface Lines and the Rapid Transit System, and initiated steps to acquire the Motor Coach Company for inclusion in the merger. Numerous new operations were started during the year in smaller cities, a trend that is likely to continue in the immediate future.

The intercity field has also seen many changes. The Interstate Commerce Commission has granted approval for the transfer of many certificates, some of which have been before the Commission for a considerable length of time. Complete statistics as to the number of transfers approved by the ICC and the different state regulatory bodies would indicate at least 100 transfers of ownership approved during the year.

AIR CONDITIONING

Air conditioning of vehicles used in city services was first introduced in 1945. Credit for the first installation goes to the company at Atlanta, Ga., where the first air-conditioned trolley bus was put into service in September. Soon after, San Antonio put an air-conditioned motor bus into service. Rider surveys have proved these installations highly popular, and plans are under way for expanding this type of service. The coming year will see marked progress in this popular innovation as new buses and trolley buses are put into service.

THE OUTLOOK

With every vestige of government wartime regulation eliminated the industry is again free to pursue its own decisions. The industry will spend millions of dollars for improvements including new equipment, new shops, and garages, new terminals, and rest stops for increasing the comfort and convenience of its passengers. Service will be improved through express runs both in local and intercity service all with the motive of reducing travel time.

Some slight measure of Federal tax relief is in prospect for bus companies during 1946 under the repeal of the excess profits tax, the elimination of the capital stock taxes, and the automobile use tax which applies to buses as well. Long term tax prospects are not too reassuring unless excise taxes on gasoline, rubber, and oil are modified downward. These are now under consideration by Congressional and Treasury experts and are subjects for hearings on the long term tax bill early in 1946. As matters stand, bus companies operate for the most part under fixed rates, and continuation of high taxes along with higher wage rates will increase the cost of service. Without compensating increases in revenue the industry will face the necessity of increasing its rates.

Already the municipal operations at

Detroit and San Francisco have raised fares to meet higher wages and to finance improvements. The city of New York is working on a plan to double the local sales tax in order to secure funds with which to rehabilitate and improve its municipally owned and operated transit system, which includes not only subways, but buses, trolley buses, and street cars.

Although labor problems are many and in some places critical, with strikes an inevitable step in the solution, this is but a part of Labor's program in its effort to secure higher take-home pay for a shorter work day. The bus industry is a fully regulated industry and its ability to pay is no secret. Since rates of fare must be approved before application by regulatory commissions, the proposal by Governor Edge of New Jersey for a Labor Arbitration Board is worthy of notice. However, it might be well to give the commissions that now fix passenger rates added responsibility in the matter of determining wages and working conditions, and so be able to control the whole cost of service for the public at large.

In 1946 some of the plans developed by the different carriers will approach realization. There will be further motorization of existing street railways systems and some expansion of trolley bus services. Management will strive for better public relations, and employee relations, likewise, will be one of the problems calling for continuing attention. Better places in which to work, better shop facilities, better garage layouts, and more efficient tools all can be expected to increase morale and productivity. Coupled with this is the matter of wages and hours of work.

Merchandising is another important subject. Goods can not be sold unless displayed. Bus services, too, must be on display, otherwise there can be no sale. More and faster service means more sales, consequently more riders, and in the end should result in better public relations if those who ride are treated in accordance with their expectations. Such modernization plans cost money and riding must be continued on a level to meet the cost of service of the kind the public wants.

Management never had so great an opportunity to provide modern transportation service. By comprehensive planning and evaluation of conditions in the locality served, carriers can revamp their systems of routes to provide more convenient and faster service. Through routings to eliminate transferring and express services between heavy loading points will give a new opportunity to gain new and additional traffic. Each carrier must evaluate his own future traffic and have plans by which it can be handled expeditiously.

Some conception of short-time trends in local traffic can be determined by evaluating the factors which have an effect on riding. These include: (a) employment in the territory served; (b) man hours worked; (c) department store dollar sales; (d) automobile registrations. To these four factors can be added long-time factors that to a large extent are within the control of the carrier and others in which the carrier has a major interest. Among these are: (a) modernization of the bus fleet; (b) type of employee selected for contact with the public; (c) employee training plans for efficient operations; (d) improved employer-employee relations; (e) better public relations; (f) number of new automobiles sold in the territory; (g) modern street traffic control systems; (h) restriction of automobile parking on transportation streets in bottleneck areas; (i) express bus service to outlying housing developments; and (j) crosstown routes to shorten time of travel in rush hours.

These are among the salient considerations in the situation at the beginning of 1946. It is, of course, true that some economic factors are at work over which the bus industry has no control, but the industry will advance to the extent that it intelligently and resourcefully continues to exert every effort to shape its own destiny.

COMMUNITY TRANSIT

By Guy C. Hecker
Executive Manager, American Transit Association

TRAFFIC VOLUME

The year 1945 saw what will probably be for many years to come the peak of community transit travel. The total of 23,017,000,000 rides registered in 1944 was topped by the 23,300,000,000 rides taken in 1945. In March 1945, 2,086,520,000 passengers were carried, the greatest number ever carried in a single month in transit history. All forms of community transit—street cars, motor buses, and trolley coaches—shared in the advance to new high levels in 1945. Rapid transit riding, which is confined to the largest metropolitan cities and which had decreased slightly in 1943, recovered in 1945 and established a new high record along with the other types of transportation. In the accompanying table the number of passengers carried in 1945 by each type of community transportation is shown together with the percentage change from 1944. In the same table there is also shown the number of vehicle miles operated and the operating revenues of each type of transportation with percentage changes from 1944.

TRANSIT OPERATIONS IN 1945

	Calendar Year 1945 Estimated (Millions)	Per Cent Change From 1944
Transit Passenger Traffic		
Surface Street Car..	9,585	+0.73
Rapid Transit......	2,673	+1.98
Trolley Coach......	1,249	+1.22
Motor Bus........	9,793	+1.52
Total.........	23,300	+1.23
Transit Vehicle Miles		
Surface Street Car..	948.6	−3.00
Rapid Transit......	452.3	−1.89
Trolley Coach......	131.6	−0.53
Motor Bus........	1,691.4	−1.28
Total.........	3,223.9	−1.85
Transit Revenues		
Surface Street Car..	$ 569.2	+1.26
Rapid Transit......	151.6	+2.78
Trolley Coach......	69.1	+2.37
Motor Bus........	594.4	+1.57
Total.........	$1,384.3	+1.61

In the following table indexes of community transit travel are shown for the years 1945 and 1944, the indexes being based on the average traffic for the five years 1936 to 1940 as 100. On this basis the 1945 index for community transit riding in the United States as a whole was 179.3. The table also shows indexes constructed on the same basis for the traffic in those groups of cities classified according to population.

1944-1945 TRANSIT TRAFFIC INDEX

(Av. 1936–40 = 100)

Population Group	1945 Index (Partially Estimated)	1944 Index
Cities Less Than 250,000.	273.2	270.0
Cities 250,000—1,000,000.	205.3	203.3
Cities Over 1,000,000....	132.1	130.9
United States—Total....	179.3	177.1

This grouping serves to bring out the fact that the largest increases in traffic during the war occurred in the smaller cities and the smallest increases in the larger cities. One reason for this was that war industries and military centers were frequently located in or near small cities and increased very materially the riding populations of those cities. A more general and more potent reason, however, was the fact that before the war a larger proportion of the population in the small cities depended upon private automobiles for daily transportation than in the large cities. The proportion tended to grade progressively downward as one went from the smallest to the largest cities. When gas rationing went into effect, therefore, a larger portion of the population had to transfer from private to public transportation in the small cities than in the large cities with consequently greater percentage increases in transit traffic in the former than in the latter.

POST-WAR DECLINE IN TRAFFIC

While traffic in 1945 exceeded 1944 it definitely passed through its peak in the former year. Allowing for seasonal variation the top was reached in July 1945. Thereafter traffic receded, and in the month of September it dropped below 1944. Each succeeding month to the end of 1945 continued below the corresponding month of the preceding year. The decline was gradual, however. The sharp drop which some in the industry thought might come with the end of the war did not occur. The largest decrease was registered in September which was 5 per cent below September 1944. In the succeeding months of 1945 the decline did not exceed 4 per cent. The decline in traffic that did occur in the closing months of 1945 can be attributed to the ending of gasoline rationing and to the reduction of employment in the war industry centers. It was stemmed in some measure by the ability of peacetime industry to absorb displaced war workers. Scarcity of new tires and the delays experienced by the automobile manufacturers in getting into production were also factors tending to keep transit riding from dropping off too rapidly.

RELAXATION OF TRANSIT CONTROLS

Wartime controls of community transit were relaxed with commendable speed after VJ-Day. Gasoline rationing was ended the day after the war in the Pacific stopped. ODT orders establishing the allocation of new vehicles according to war necessity, the requirement that all public carrier vehicles carry certificates of war necessity from the ODT, and the restrictions on new routes and route extensions were repealed by Sept. 1. Similarly, WPB controls on the production of new vehicles and on materials and parts were abolished by Sept. 30. On Oct. 30, the National War Labor Board ceased to control wage increases except where price increases were also involved. Within little more than a month, in fact, practically all government controls had been removed from the industry. One important exception was the rationing of tires which was not ended until Jan. 1, 1946.

The period of government controls had been a trying one. It was a new experience for transit to have its course of action prescribed for it so minutely and specifically as the war agencies did, particularly the ODT. There were many complicated situations to work out and many diverse interests to reconcile. ODT adopted an enlightened policy, however, and with all parties working for a common objective the problems presented did not prove insoluble. At the first general meeting of the American Transit Association after the war the industry took the occasion to "publicly acknowledge the outstanding contribution of the Office of Defense Transportation to the operation of the country's transportation systems during the war period," and to express a "lasting sense of gratitude" to the ODT staff "for the wise and intelligent administration of the difficult duties assigned to them throughout the entire course of the war."

DEVELOPMENT OF BUS SUBSTITUTION

Among the restrictions lifted by ODT shortly after the end of the war was the ban on the substitution of rubber-tired vehicles—motor buses and trolley coaches—for street railway cars, established in the interest of conserving gasoline and rubber. At the time the ban was established a number of companies had matured plans for replacing street cars with buses either throughout their entire systems or on selected routes. The

Third Avenue Railway System in New York, for instance, had actually taken delivery on the buses for a cross-town route in Manhattan when the ban was established and was required to relinquish the vehicles to another operator for a service more essential to the war.

With all restrictions removed, bus substitutions will be made in all of these cases as rapidly as the manufacture and delivery of the buses will permit. During the war interval, additional companies had decided on substitutions and now have their plans ready. There are, in fact, few cities with street railway systems in which some substitutions, either with motor buses or trolley coaches, are not under consideration. Some of the more important cities, in addition to New York, in which comprehensive plans have been announced are Chicago, Detroit, Los Angeles, Cleveland, Baltimore, St. Louis, Atlanta, and Buffalo.

SUBWAY PLANS FOR LARGER CITIES

On the other hand, intolerable traffic congestion on the streets of our large cities is leading to the development of community transit in another direction,—toward the construction of subways. This congestion has slowed down the speed of all surface vehicles in the business centers of our cities to the point where the value of public transit in those districts is being seriously impaired. Bus substitution offers no relief in this situation because it would increase the number of vehicles required and thus add to the congestion on the streets. The only practicable remedy would seem to be the construction of underground rapid transit rail lines which is being put forward as the solution in those cities large enough to support such projects. New York, Chicago, Philadelphia, and Boston already have subway systems, and Detroit, Cleveland, Montreal, and Toronto have well-advanced plans for subways under consideration. Washington, D. C. also is studying proposals for underground transit.

POST-WAR SERVICE

With the end of the war the primary problem of transit became how to provide a type of service that would attract to it permanently as large a proportion as possible of its war-induced traffic. It was the misfortune of transit to have its new war patrons experience transit service at its worst. Shortages of vehicles, of manpower, of tires, of spare parts disrupted schedules and produced such overcrowding of vehicles as had never before been known. Under government regulations and restrictions designed to conserve essential materials, the limited number of new transit vehicles produced were of a type in which only the essentials of mass transportation were considered and the comfort of the transportee ignored. Similarly, routes were prescribed and schedules constructed with an eye primarily to the conservation of materials and only secondarily to the convenience of patrons. Undoubtedly the service was efficient, but it was hardly calculated to win friends.

To remove the impression made on the public by wartime service, transit managers feel they must do more than restore peacetime standards of service. They are convinced they must improve on pre-war standards. Planning to this end was begun long before VJ-Day. Routes are now being surveyed to make sure that they are reaching all sections where service is required; rails and roadbeds are being renewed and improved, and operating personnel are being retrained in their duties and in courtesy to the public. Peacetime schedules have been restored and are now being further checked for present-day adequacy. Improvements are being made to the extent that available equipment permits. Finally and most important, new equipment of all types, street cars, trolley coaches and motor buses, is being ordered and placed in service as fast as it can be delivered. There will be delays, however, because new equipment can not be obtained as quickly as desired because of limitations of manufacturing capacities, scarcity of materials, and other causes.

EQUIPMENT

In the post-war plans for the rehabilitation of transit service and its further improvement the purchase of new equipment has the most important place. Quality rather than quantity is here the controlling factor. The vehicles that hauled the wartime traffic loads are undoubtedly adequate in numbers to handle the anticipated peacetime traffic, but they are decidedly not adequate in quality. The pre-war vehicles are now somewhat outmoded, and those built to the Spartan specifications prescribed in wartime have no permanent place in the plans for peacetime operations. Practically all of the wartime bus fleets and a substantial portion of the street cars are due for replacement with modern vehicles. Forward-looking managements set aside special funds from their wartime revenues for this purpose.

A great deal of thought and planning has been devoted to the design of these new vehicles. The specifications of the PCC street cars are being restudied and revised, and a lighter vehicle is expected to result, with even smoother running qualities than the original PCC car. The new buses are also being improved with special attention to the comfort of the passenger through new springing and smoother acceleration. More attention is also being given to adapting the design of the bus more closely to the special requirements of the route over which it is to operate. Experiments in air conditioning of transit vehicles already are taking place. Atlanta, Ga. is now operating an air conditioned trolley coach, and San Antonio, Tex. is experimenting with an air conditioned bus.

Shortages of materials and reconversion problems held down the production of new vehicles in 1945 despite the great number of orders that began to pile up after VJ-Day. Even the production quotas authorized under war conditions by the War Production Board at the beginning of the year were not attained. Important manufacturers converting from war work were unable to get into production before the end of the year. Others were able to complete only a small number of vehicles in the last few weeks of the year.

In spite of these handicaps the number of vehicles produced in 1945 exceeded the average in the years 1939-40 and, of course, greatly exceeded the production in the two mid-war years 1943 and 1944 when the limitations and restrictions were the severest. Only in the period just before war quotas were established was production greater.

Following is a comparison of transit equipment produced in the last seven years:

ANNUAL TRANSIT VEHICLE PRODUCTION

	1939–40 Average	1941	1942	1943	1944	1945
Street Car	444	522	344	32	284	408
Rapid Transit	77	0	0	0	0	0
Trolley Coach	484	417	336	117	55	225
Motor Bus	4,200	7,360	7,200	1,251	3,807	6,000
Total	5,205	8,299	7,880	1,400	4,146	6,633

LABOR RELATIONS

During the war wage rates rose to new high levels despite the Government's efforts to establish controls. As the Government stiffened its resistance to further increases and established a more definite policy for the stabilization of wage rates, union leaders sought additional "take-home" pay under the guise of more liberal working conditions and with considerable success. While the National War Labor Board and its several regional boards frowned on increases in basic wage rates beyond the "tested and going rates" established, they were willing to listen sympathetically to pleas involving the so-called "fringe issues," most of which, while not affecting the basic hourly rates, increased the take-home pay substantially.

During this period also the unions succeeded in having written into many contracts clauses providing that, if the stabilization policy of the Government were changed during the term of the contracts, the union would have the right to reopen the contract and demand a readjustment of wages in the light of the changed policy of the Government. When the war ended and the Government relaxed its wage controls this was construed as such a change in policy, and, accordingly, a number of such contracts were reopened and new wage demands presented. Some of these demands were adjusted satisfactorily and in others negotiations were still continuing as the year ended. In several cases, however, strikes were precipitated and others threatened at the year-end.

Future labor relations are a matter of serious concern to the industry. There is doubt whether the volume of transit traffic will support the present high level of wages when private automobiles again become freely available to all prospective purchasers. The resulting squeeze between labor cost and declining revenue will be a severe test of managerial skill and of labor statesmanship. Both sides are aware of the situation and, while viewing the problem from opposite sides, there is reasonable expectation that they may be able to agree on an approach that will produce an equitable solution.

FARES

A rather significant development at the end of 1945 was the announcement of the Department of Street Railways in Detroit that it would increase its rate of fare to 10 cents, effective Jan. 1, 1946. The conditions that led this municipal transit system to take such action are in a sense an exaggeration of conditions that are latent on other transit properties. Owing to the necessity of competing for manpower with the automobile manufacturing companies, transit wages in Detroit are the highest in the country. Nearly 70 per cent of the revenues of the Detroit transit system is absorbed by wages. When factories in Detroit began to let out employees at the end of the war transit traffic fell off, and those responsible for the operation of the system reached the conclusion that higher fares were a necessity if the system was to continue solvent.

Similar developments in other cities are a possibility of the future. Detroit was especially vulnerable because of its extraordinarily high labor costs and because, being at the center of war industries, its traffic was immediately affected by the let-down in war production when the war ended. Other transit systems may experience similar effects later.

Wartime standards of service can not be continued in peacetime. It has already been indicated that transit managers generally feel that pre-war standards of service will not be satisfactory to the public in the post-war years. Something better will have to be given, but costs have risen some 40 per cent over the pre-war levels. Under present-day costs the pre-war standard of service could not be given with the pre-war level of traffic and the present level of fares.

Undoubtedly a strong effort will be made to hold as much of the present traffic as possible and also to reduce the unit cost of service by greater operating efficiency. To the extent those measures are successful the necessity for higher fares will be reduced. If traffic drops off too fast, however, it is not expected that any increase in operating efficiency will be enough to offset it. Under such conditions the necessity of seeking increases in fares will become a distinct possibility for many companies. No more than other industries can transit meet post-war costs with a pre-war price level and a declining volume of business.

XIII. MANUFACTURES AND TRANSPORTATION

THE MERCHANT MARINE

By John Niedermair
Bureau of Ships, Navy Department

SHIPBUILDING

In view of the tremendous change of pace which took place in the production of ships during 1945, no month by month discussion of the shipbuilding record was considered essential in this review. Instead, a summary of the production record of the individual shipbuilding yards and their production during the war years is included for merchant ships of over 2,000 gross tons. Many merchant-type vessels under 2,000 gross tons each, self-propelled and non-propelled, were constructed by the Maritime Commission, the Navy, and the Army.

Of the 4,120 cargo ships shown in the accompanying table as being completed during the war years (1939-1945), up to Nov. 1, 1945, 2,648 were Liberty ships. The remainder were cargo ships of special design constructed for private interests and ships of the standard C-1A, C-1B, C-1M, C-2, C-3, C-4 types, Victory ships and oil tankers built for the Maritime Commission. The Pacific Coast yards completed 2,238 merchant ships as compared with the combined total of 2,776 ships completed by the yards on the Atlantic, Gulf, and Great Lakes combined.

While a total of 5.014 merchant ships were built during the war years, not all of these ships are now in the American Merchant Marine. Many have been sunk in war action, some were wrecked, and a large number were turned over to the Navy and Army for conversion into special auxiliary types such as ammunition ships, tank transports, airplane carriers, hospital ships, and naval tankers.

At the start of the war there were 1,321 merchant ships over 2,000 gross tons each, under the American flag, excluding the vessels on the Great Lakes.

POST-WAR PLANNING

After an extended period of investigation, the Post-war Planning Committee of the Maritime Commission submitted a report on Trade Routes to the shipping industry. The report covers the recommended foreign trade and estimated dry cargo ship requirements for the post-war operation of the United States Merchant Marine. It does not cover the offshore domestic trades which are protected by law from foreign flag competition. The routes have been grouped according to world areas and constitute seven basic divisions as follows:

ATLANTIC AREA POST-WAR TRADE ROUTES

The United Kingdom and Eire and the Atlantic Coast of Europe, including the Baltic.

Route 5—United States North Atlantic—United Kingdom and Eire; five passenger and/or freight services; 16 vessels.

Route 6—United States North Atlantic—Baltic-Scandinavian Europe; two passenger and/or freight services; 11 vessels.

Routes 7 and 8—United States North Atlantic—Antwerp-Hamburg range; three passenger and/or freight services; 13 vessels.

Route 9—United States North Atlantic — Atlantic France/Northern Spain; three passenger and/or freight services; 3 vessels.

Route 11—United States South Atlantic—United Kingdom/Continental Europe (north of Spanish border) Scandinavian and Baltic ports; two freight services; six vessels.

Route 21—United States Gulf to United Kingdom, Continental Europe (north of Spanish border) Scandinavian and Baltic ports; eight freight services; 34 vessels.

Route 26A—United States Pacific—

United Kingdom; one freight and one refrigerator service; 22 vessels.

Route 26B—United States Pacific—Havre-Hamburg range; one freight service; 13 vessels.

MEDITERRANEAN AREA

European and North African ports on the Mediterranean Sea.

Route 10—United States North Atlantic to Mediterranean, Black Sea, Portugal, Spain (south of Portugal), Morocco (Cassablanca to Tangiers); four passenger and/or freight services; 13 vessels.

Route 13—United States Gulf and South Atlantic to Azores, Portugal, Spanish Atlantic, Mediterranean and Black Sea ports; two freight services; seven vessels.

CARIBBEAN AREA

The West Indies; East Coasts of Mexico, Central America and the Canal Zone; the North Coast of South America as far as Brazil.

Route 3—United States Atlantic Ports to East Coast of Mexico; two passenger and/or freight services; five vessels.

Route 19A—United States Gulf to Cuba, Haiti, Dominican Republic, East Coast of Colombia, Panama Canal Zone; two freight services; six vessels.

Route 4—United States Atlantic ports to Caribbean, not including East Coast of Mexico, 46 vessels.

Route 19—United States Gulf ports to Caribbean, not including Route 19A; 24 vessels.

Route 23—United States Pacific ports to Caribbean; no recommendation as area is served by vessels which transit the Caribbean in process of serving other routes; direct service for area appears unnecessary.

AFRICAN AREA

The African Coast except that on the Mediterranean Sea.

Route 14—United States Atlantic and Gulf to West Coast of Africa (from southern border of French Morocco to Cape Frio) and the Madeira, Canary, Cape Verde, Fernando Po, Sao Thome, and other islands adjacent to the West African coast; one freight service; five vessels.

Route 15A—United States Atlantic ports to southeast African ports, Cape Guardafui and Madagascar; one freight service; 12 vessels.

Route 15B—United States Gulf ports to South and East African ports, Cape Frio to Cape Guardafui and Madagascar; one freight service; four vessels.

SOUTH AMERICAN AREA

Atlantic coast of South America—Brazil south; Pacific coasts of South America, Central America and Mexico.

Route 1—United States Atlantic ports to East Coast four passenger and/or freight services; 22 vessels.

Route 2—United States Atlantic to West Coast of South America—Chile, Peru, Ecuador and Pacific Coast of Colombia; two passenger and/or freight services; 14 vessels.

Route 20 & 24—United States Gulf ports to East Coast South America—Brazil, Uruguay, Argentina; two passenger and/or freight services; one freight service; 12 vessels.

Route 25—United States Pacific to West Coasts of Mexico, Central America and South America; one freight service; four vessels.

Route 31—United States Gulf to West Coast South America; one freight service; three vessels.

PACIFIC AREA

All countries bordering on the Persian Gulf and Red Sea.

Route 12—United States Atlantic to Far East; Philippine Islands, China, Japan, U.S.S.R., French Indo-China, Taiwan and Thailand; three freight services; 14 vessels.

Route 22—United States Gulf to Far East; Philippine Islands, China, Japan, U.S.S.R. in Asia, French Indo-China, Taiwan, Thailand; one freight service; 13 vessels.

Route 29—California to Far East; same countries as Route 22; two passenger and/or freight services; nine vessels.

Route 30—Washington and Oregon to Far East; same countries as

Route 22; two freight services; 12 vessels.

Route 28—United States Pacific to Straits Settlements, Netherlands East Indies, India, Persian Gulf, Red Sea; trade to be carried in part of the vessels operating on Route 17 and the round-the-world vessels.

Route 18—United States Atlantic and Gulf to India, Persian Gulf and Red Sea; three freight services; 14 vessels.

Route 17—United States Atlantic and Gulf to Straits Settlements and Netherlands East Indies; four freight services; 17 vessels.

Route 27—United States Pacific to Australasia (Australia, New Zealand, New Guinea, and South Sea Islands); two passenger and/or freight services; five vessels.

Route 16—United States Atlantic and Gulf to same countries as on Route 27; four freight services; nine vessels.

ROUND THE WORLD

A passenger and freight service; seven vessels.

REPORT OF SUBCOMMITTEE ON TRADE ROUTES

The Subcommittee on Trade Routes pointed out that the foregoing listed routes and services have been considered from the standpoint of essentiality and in their opinion the specified routes and services are important to the maintenance, promotion and development of the foreign commerce of the United States, and that they should be characterized as "essential."

Each of the routes had been investigated as to volume and character of traffic, and the foreign flag competition to be met. Part of the basis of the investigation seems to have been the dry cargo traffic movements for the year 1938, although, when abnormal factors were found to have existed in other years, allowance for this was estimated in order to arrive at what may be termed a representative year. The committee then reviewed the "known and anticipated factors—both political and economic—which are expected to affect the post-war volume and character of trade." Next, and most important to note, the committee stated that "on the basis of this an estimated tonnage target has been selected to be used as a guide in the planning of United States flag services." They stated that "this tonnage target has been set at 50 per cent of the traffic which liners could reasonably expect to carry, or that share of the trade which American flag services actually carried before the war—whichever was the larger."

In considering the potential competition to be met, the committee assumed that German and Japanese shipping will not be resumed on any important scale, if at all, and declared: "Where such services were of any great value in serving the foreign trade of the United States, the establishment of United States flag services to replace them has been recommended."

The committee reported that "the principal competition in the United States foreign trades will come from the British, Scandinavians, and Dutch, with some of the American republics playing an increasingly important role in the Western Hemisphere trades, notably Brazil, Argentina and Chile, with limited competition also probable from the French and other European Nationals." The committee then made the pessimistic contention that "where this competition is encountered, it may be difficult for American flag vessels to get a full share." Also: "Serious competition may also be expected from United States companies which operate foreign flag chartered tonnage. Most of the cut-rate competition which from time to time has proven so injurious to the United States flag merchant marine has come from such companies. This type of competition will probably be resumed once tonnage becomes available for charter and the rates go down."

Noted elsewhere in the report is the statement that the desired result is adequate American flag participation in the carriage of the foreign trade of the United States. The committee pointed out that "before the war American flag participation in the transportation of passengers and traffic was inadequate on most foreign trade routes due largely to deficiencies in service and equipment. The services suggested in the report are in general superior to the American flag services offered before the war."

ANALYSIS OF THE REPORT

From the physical aspect and overall viewpoint, the actual set-up of the trade routes and services proposed appear to be excellent and an improvement in coverage over what existed pre-war. It may be, however, that operators who have had experience on certain of these routes in the past will be able to point out modifications which should still further increase the coverage and perhaps enhance the volume. As a matter of fact, a very conservative and safe program seems to have been the main thought of the committee and the recommendations of the late President Roosevelt for a "bold and daring" plan have been ignored; at least, if we can interpret the recommendation to mean the securing of additional foreign trade and shipping services, as well as the building of a fleet of express combination passenger and cargo liners.

From the detailed information provided in the report, an analysis has been prepared by the *Marine Engineering and Shipping Review*, covering the number, tonnage, and type of vessels which would be required in each of the seven geographical trade areas, together with the total maximum yearly sailings and the total deadweight tonnage which would be employed over the span of one year. This is shown in Table 1.

By reference to the summary in Table 2 it will be noted that the committee's recommendations contemplate the employment in foreign trade yearly of 395 American flag vessels with a total deadweight tonnage of 3,778,120 tons, or approximately 3,400,000 tons cargo capacity. The maximum yearly sailings contemplated are 1,981, which would provide a yearly vessel deadweight tonnage of 20,107,060 tons, or approximately 18,000,000 tons cargo capacity, on the 34 trade routes and 75 shipping services. From the committee's report it has also been possible to compile Table 3 showing the total number and deadweight tonnage of each type of vessel proposed to be used on these trade routes.

It would appear that the committee has made very little provision for capturing the theoretical 50 per cent of our foreign waterborne commerce, as the fleet proposed, with a deadweight tonnage of 3,778,120 tons, is only 15 per cent greater in carrying capacity than the United States flag foreign trade fleet of 1938 which was slightly over 3,300,000 deadweight tons, and which moved only 26 per cent of the dry cargo imports and exports of the United States, or 11,637,000 tons.

By reference to Table 4 it will be noted that American flag ship operators were able to employ in foreign trade in one year (1939) as many as 551 vessels of about 4,500,000 deadweight tons. This figure represents the maximum employment attained of American tonnage in foreign trade in any one year between the First World War and the Second World War. While this trade fleet was of lower average speed than the proposed post-war American flag foreign trade fleet, it did succeed in moving 19,442,000 tons of cargo, which is 1,000,000 tons more than the yearly cargo capacity of the proposed new fleet with the scheduled sailings as outlined. In that year, only 32 per cent of the United States imports and exports was carried in American bottoms.

If American salesmanship was able to sell shipping services, passenger and freight, to this extent in the past, the question arises why should 1938 results be used as a basis, or a limiting factor such as 50 per cent of the traffic be placed upon American initiative?

In 1938 a total of 18,200,000 deadweight tons of foreign flag and Ameri-

can flag tonnage was employed in the American passenger and cargo waterborne foreign commerce, a fleet more than 4½ times the size of the proposed American flag post-war foreign trade fleet.

With a yearly cargo-carrying capacity of about 18,000,000 tons provided for on 1,981 maximum number of sailings, it would seem that the committee has not aimed high enough, as the total oceanborne dry cargo moved in American commerce in 1938 was slightly over 44,000,000 tons, or 2½ times the capacity of the fleet provided for in the report. This traffic has ranged as high as 75,300,000 tons in the years between the two wars, or four times the capacity of the post-war foreign trade fleet proposed.

Allowing for dislocation of world trade as it existed pre-war, and having in mind that the Administration at Washington is endeavoring to increase imports and exports, the carriage of 50 per cent of American foreign commerce would seem to necessitate the provision of a larger fleet.

Before the war, Germany, Japan and Italy controlled 13,000,000 deadweight tons of passenger and cargo carrying vessels. Far more than 50 per cent of this tonnage was destroyed during the war. A large percentage of this tonnage was employed pre-war in the American foreign trade, and in the case of the latter two nations shipping services sold to other nations kept at least 20 per cent of their fleets occupied. While the committee does mention the former German and Japanese shipping, no mention is made of the lost Italian merchant vessels. Evidently little consideration was given to the services maintained by the Axis powers to other parts of the world than the United States, and these routes are therefore supposedly to be left to other nationals to service. Great Britain and Norway have never hesitated about operating shipping services between other nations than their homeland; for example, the British flag Furness Prince Line operated for years before the war between New York and South America.

While the Trade Routes Committee has characterized these 34 trade routes and 75 shipping services as "essential," it can not be assumed that the Maritime Commission would certify these routes as "essential" and award an operating-differential subsidy to the proposed 395 vessels to be employed in foreign trade, unless foreign flag competition should develop on each trade route. The number of vessels receiving an operating-differential subsidy each year since the enactment of the Merchant Marine Act of 1936 has been less than one-half the number in the proposed new fleet. The numbers subsidized each year were as follows:

July 1, 1937	154 vessels
December 31, 1938	126 vessels
September 30, 1939	141 vessels
June 30, 1940	129 vessels
December 31, 1940	139 vessels
June 30, 1941	132 vessels

The number of ship operating companies receiving an operating-differential subsidy each year and the total number of vessels owned by these companies follow:

Year	Number of Companies	Number of Vessels Owned at End of Each Year
1938	16	177
1939	13	161
1940	12	138
1941	12	137

THE LONG-RANGE SHIPBUILDING PROGRAM

On Sept. 18, 1945 it was disclosed that the Maritime Commission officials had been conferring with the Budget Bureau on the 1947 fiscal year shipbuilding contract authorizations which called for the construction of 75 ships, including 11P-4 type passenger liners. At the same time it was disclosed that the Commission's wartime program, which called for 5,678 ships, was 95 per cent completed on Sept. 15 with 344 ships, including 44, under private contracts, remaining to be delivered in 1945 and 1946. Of the 35 shipyards still engaged in this program, only 12 yards have contracts carrying them into 1946. The 1945-1946 contracts call for deliveries totaling 250 during the balance of 1945 and 84 in 1946. Of 60 keels to be laid down after Sept. 15, 23 are scheduled to be laid down in 1946.

RADAR AS SAFETY EQUIPMENT FOR PASSENGER SHIPS

With the conclusion of the war, various wartime developments of interest to the maritime industry can now be disclosed. These developments are the result of experiments, investigation into the operation of the equipment under actual service conditions, and practical applications of equipment. Of these, the most important piece of equipment contributed by the war effort, from the standpoint of safety, is radar. Long before the secrets of radar were released to the public in 1945, its application as a safety feature on merchant ships had been realized by the Navy and Coast Guard by reason of their association and reliance on this equipment. This remarkable technological achievement, conceived long before the war, but brought to practical success only by the impact of war, promises to be one of the most important single safety features ever put to use on merchant ships. As time goes by, radar screens on the bridges of ships can be expected to be as common as the gyro-compass.

Radar was developed primarily as an instrument to be used for detecting and ranging in warfare. Since radar is able to detect land, vessels, buoys, and other objects above the water within range of the equipment, it has demonstrated its usefulness as an aid to navigation when making landfalls, as a warning device to prevent collision at sea, and as a means of piloting when entering port in fog or poor visibility. The basic principle of radar—the name comes from

TABLE 2

SUMMARY OF VESSELS REQUIRED ON TRADE ROUTES PROPOSED FOR AMERICAN FLAG FOREIGN SERVICES

	No.	D. W. T.	Maximum Yearly Sailings	Total Yearly D. W. T.	Trade Routes	Services
Mediterranean Area	20	220,520	140	1,591,760	2	6

Totals	395	3,778,120	1981	20,107,060	34	75

"Radio Detection and Ranging"—is not a difficult one. The discovery which led to the actual development of radar was made in 1922 by two scientists working at the Naval Aircraft Radio Laboratory, Anacostia, Maryland. Testing plane-to-ground communications they noticed that ships moving in the Potomac River distorted the pattern of radio waves, causing a fluctuating signal. From this discovery, development was pursued almost continually after that until 1935, when Congress awarded a $100,000 appropriation to the Naval Research Laboratory for the specific development of radar. A rather crude radar was tested successfully in 1937 aboard the *USS Leary*, and a greatly improved one was given extensive sea trials on the *USS New York* in 1939. Before that, experimental work conducted from the ground, employed a variety of ships and aircraft and the dirigible *Akron*.

Totals	395	3,778,120

The typical radar set, as it is known today, consists of a receiver and transmitter in the same place and often employing a common antenna. The transmitter sends out energy in very small bursts called "pulses." These bursts of ultra high frequency waves travel at the speed of light, 186,000 miles a second. After each pulse, the transmitter waits a relatively long time—a few thousandths of a second—before sending the next pulse. During this interval the receiver gets back the echoes of the pulses from any object which might have obstructed the wave of energy, the echo being known as a "pip." The "pip" is recorded as an interrupting rising and falling line on the pulsing line ("time base") on the face of a cathode ray tube. Direction is obtained by providing the radar with a directional antenna which sends out the pulses in a narrow beam, like a searchlight. The antenna may be rotated as the pulses are sent out, and the "pip" occurs when the antenna points at a target. The distinct advantages of radar are: 1. it is the best anti-collision device yet perfected; 2. it makes for greater safety while piloting or making landfalls during periods of low visibility; 3. it indicates continuous instantaneous accurate ranges and bearing of objects; 4. it presents a chart-like picture of the surroundings, the presentation being in the nature of a polar chart with you at the center; and 5. by observation of the scope, movements of objects are indicated.

The Coast Guard, by reason of its experience with radar and in an effort to aid the merchant marine in the selection of suitable equipment, has assumed, with the approval of the Chief of Naval Operations, the responsibility of determining the minimum requirements of radar apparatus for installation aboard merchant ships.

TABLE 4

NUMBER AND GROSS TONNAGE OF AMERICAN FLAG MERCHANT VESSELS OF 1000 GROSS TONS AND OVER EMPLOYED EACH YEAR IN THE FOREIGN DRY CARGO TRADES OF THE UNITED STATES, EXCLUDING VESSELS ON THE GREAT LAKES

(As of June 30, 1945)

Year	Combination		Cargo		Totals

COMMERCIAL AVIATION

By ANDREW F. HAIDUCK

VICE PRESIDENT, BELLANCA AIRCRAFT CORPORATION

GENERAL

The rapidly changing scene in 1945, culminating in V-J Day, had in general salutary effects on the various phases of commercial aviation. Revenue miles flown increased 51.9 per cent over 1944, reaching an all-time high of 219,169,450. Passenger miles showed a 54 per cent increase. Redeployment, as well as demobilization, helped to keep the load factor at 88.76 per cent, somewhat less than the 90.16 figure for 1944.

Revenue passengers totaled 6,621,842, a 44.7 per cent increase. At the end of the year, there were still insufficient seats to handle all of the traffic, particularly since the Army and Navy reserved 70 per cent of the eastbound space for returning veterans. Converted C-54s were making their appearance on the airline networks toward the end of the year. However, most of the airlines had also contracted for new planes to be delivered in 1947 with projected schedules at that time of eight hours from Los Angeles to New York.

Air mail-ton miles also registered a substantial gain with a 41.8 per cent increase for the year's operations. Actually, air mail service has doubled in the last two years, and the Post Office is now making money on air mail operations.

Air Express ton miles climbed to 24,505,243, a 42.8 per cent increase over 1944. Also a 13 per cent reduction in rates was instituted by the 19 domestic operators at the end of the year.

Passenger fares were reduced to 4½ cents per mile, a reduction of 17.8 per cent over the 1944 rate. Passenger revenue continues to be approximately 72.5 per cent of the total with mail yielding 21 per cent and express 5 per cent.

The number of airports continued to increase, but the National Airport Plan was still bogged down in Congress. The situation was somewhat obscured by the problem of approximately 700 surplus airports.

Manufacture of new civil aircraft was in the stage of reconversion with deliveries scheduled to start in quantity in early spring. Considerable modification of war models of C-54's was in process at the end of the year, and it is expected that a total of 1,000 airplanes will be converted to airline usage. Personal aircraft manufacturers had approximately 50,000 orders on their books, an unprecedented figure. Its magnitude can best be gauged by the fact that the greatest number of civil planes produced in any one year did not reach 7,000.

Research was recognized by all as of paramount importance in view of the many phases that were revealed to the public after V-J Day. Radar, jet propulsion rocket ships, guided missiles, new materials, all these lent a somewhat Buck Rogers aspect to this side of the picture.

SCHEDULED AIR TRANSPORTATION MILEAGE

Domestic revenue miles flown in 1945 were estimated at 219,169,450, a 51.9 per cent increase over the figure of 144,240,440 miles in 1944. The estimated total is derived from the sum of actual operations for the first ten months of the year and an estimate of the last two months operations. Revenue passenger miles for the year, estimated on the same basis, totaled 3,525,619,866 as compared with 2,243,425,630 miles for 1944, an increase of 54 per cent. The end of hostilities in the European theater and the subsequent redeployment to the Pacific put an unprecedented westbound load on the airlines which was exceeded only by the eastbound load imposed after V-J Day by the transportation of returning soldiers and sailors.

Approximately 32,000,000 revenue miles and 493,000,000 revenue passenger miles were chalked up by approximately 100 airplanes in the overseas operation. In the regular transatlantic services, the Air Transport Command utilized the services of the four largest domestic airline operators, *i.e.* Transcontinental and Western Air, American Airlines, Pan American Airways, and American Export Lines. The first two alone had 27 scheduled crossings every day. With the advent of V-J Day and the increased emphasis on demobilization, the activities of the Air Transport Command were curtailed towards the end of the year. However, the commercial carriers were establishing non-military services as fast as international agreements would permit. At the end of the year, there were approximately 100 airplanes in transoceanic service. At the same time American Airlines inaugurated the first daily commercial landplane service to England with a schedule of seven round trips a week.

The domestic network of airway route miles reached the all-time high of 66,971 miles, an increase of 65 per cent over the 1944 figure of 40,392 miles. As of December 15, there were 402 transport airplanes flying in regular scheduled service over these routes. Again, this is an all-time record as compared with the previous maximum of 359 aircraft in use prior to Pearl Harbor. Plane utilization reached a maximum of 11 to 12 hours daily, but this had dropped somewhat towards the end of the year. However, the airline operators had placed

orders for additional new airplanes, as well as some conversions, which will bring the fleet total to 1,414 planes by the end of 1946, with a seating capacity of 58,284 passengers.

PASSENGERS, SCHEDULES, AND EQUIPMENT

The number of revenue passengers carried in 1945 was 6,621,842, an increase of 44.7 per cent over the previous yearly total of 4,575,716. Undoubtedly the extensive redeployment of troops across the country after V-E Day and the eastbound load of returning soldiers and sailors helped considerably in establishing the record figure. At the end of the year, the seating capacity was still insufficient, so much so that the Army and Navy took over 70 per cent of the eastbound space for returning veterans. The load factor, however, decreased for the first time to a figure of 88.76 per cent, a 1½ per cent reduction over 1944 operations, when the load factor was 90.16. With the addition of more airplanes to the airline fleet and the reduced usage by the military services, it is expected that 1946 will see a further reduction of load factor. For the first ten month period of 1945, American airlines, United Airlines, Eastern Airlines, Pennsylvania Central Airlines, and Transcontinental and Western Air carried the greatest number of passengers in the order indicated. The numbers were respectively 1,054,779, 621,637, 610,000, 606,083 and 463,595, a total of 3,361,094 passengers, representing approximately 67.4 per cent of the total for all airline operators.

Passenger seat miles flown in the period from January to October inclusive totaled 3,144,347,940, an increase of 56.1 per cent over the same period in 1944. The ratio of passenger miles flown to seat miles flown results in the load factor of 88.76. As more equipment goes into service in 1946, seat miles will go up at a very rapid rate. The estimated total of 1,414 airplanes by the end of 1946 will seat 58,284 passengers. The average number of seats per airplane rose to 19.2, a 1 per cent increase over the 1944 figure. The average speed remained about 195 miles per hour as in 1944. Of the 634 domestic transports available or on order Jan. 1, 1946, 458 were the familiar DC-3 type. The Douglas DC-4 (Army C-54) was next in number with 147. Lockheed Lodestars, Electras, and Boeings made up the remainder of 29.

All of the larger operators had orders placed for more efficient and speedier transports. Eastern Air Lines, Transcontinental and Western Air, and Pan American Airways will be using the new 48 passenger Lockheed Constellations, with a cocktail lounge, rest rooms, and dining facilities. This airplane will make possible such schedules as 8 hours and 37 minutes from Los Angeles to Honolulu or 4 hours from New York to Miami.

Boeings' Stratocruiser, a development of its famous B-29, can carry 114 passengers as a commuter. As a deluxe model it will accommodate 67 passengers in its upper deck and 14 in the lower deck lounge. Performance is such that Chicago is within 2 hours 30 minutes of New York and Los Angeles is only 8 hours 10 minutes from the East Coast. Another interesting model to be delivered to the airlines in 1947 is the Martin 202, a 30-place short haul airliner featuring low operational cost aimed in the direction of a 3-cent per mile fare. Many other more advanced types are in the process of development.

The length of the average trip per passenger of the domestic carriers as derived from the first ten months' operations was 562 miles, whereas the figure for all of 1944 was 571 miles. Overseas operations average trip was approximately 1,000 miles.

Most of the passengers carried in 1945 were still Army and Navy personnel or civilians with high priority. It is expected that the O.D.T. space control directive relative to eastbound transportation will be lifted by March 1. Thus 1946 will be the first year of a somewhat normal complement of civilian traffic. All indications point to a sustained level equal to or greater than the 1945 operation. Detail figures of revenue miles and passengers for each of the domestic operators are given in the table (pp. 608-9) for the first 10 months of the year.

AIR MAIL

Air mail ton miles for the year was 72,231,126 according to Air Transport Association reports, representing a 41.8 per cent increase over the 1944 figure of 50,850,000 miles. Air mail continues to be a source of revenue to the Government, with postal revenue exceeding the actual payment to the contractor. In fact, the indications are that the all-time deficit was wiped out by the end of 1945. Actual profit to the Government from air mail operations in 1944 was over $50,000,000.

Air mail ton miles for the fiscal years 1943, 1944, and 1945 were, respectively, 28,241,170, 42,289,845 and 61,698,222. Using the 1943 figure as an index of 100, the 44 and 45 indices become 149.2 and 218. In other words, air mail service more than doubled in two years. Total payment to airlines for 1945 fiscal year operations were $35,536,291.68 or a unit cost of $.576 per ton mile, corresponding to .288 mills per pound mile. This unit payment is 87.2 per cent of that of 1944 when the rate was .33.

The five highest payments to airline operators for carrying mail were United Air Lines $10,889,614.27, American Airlines $6,925,459.54, T.W.A. $6,737,243.34, Eastern Airlines $3,009,106.41, and Northwest Airlines $1,586,220.04. Total disbursements to all airlines were $35,536,291.68, whereas estimated payments for 1946 and 1947 were respectively $42,490,316.22 and $50,040,548.51.

The 1945 rate of payment is only 7.16 per cent of the 1933 rate which was 4.01 mills per pound mile. With the exception of 1938 and 1939, the rate has been reduced every year. In 1942 the ratio of domestic air mail to non-local first class mail was one to six. At the end of the year the perennial slogan, "all first class non local mail by air," was again in evidence. Air mail revenue continued to be approximately 20 per cent of the total revenue of the airlines, with passenger and express 74 per cent and 6 per cent respectively. In 1931, air mail revenue was 82.5 per cent of the total, whereas passenger revenue was only 17.2 per cent.

AIR EXPRESS AND CARGO

Air express ton miles for 1945 added up to a total of 24,505,243, a 42.8 per cent increase over the 17,142,676 ton miles for 1944. In the first ten months, express carried was 38.9 per cent over the previous year's period. Express ton miles (19,011,664) were 38.24 per cent above the previous year's 10 month period. It is expected that air express will continue to receive considerable impetus during the reconversion and initial peacetime production periods.

Beginning Jan. 1, 1946, the 19 domestic airline operators instituted a 13 per cent reduction in air express rates, bringing the rate down to 61.4 cents per ton mile. The expressed intention is to promote greater use of this service for the transportation of perishable commodities. Estimated revenue from express was approximately $11,000,000 as compared with a figure of $7,904,509 for 1944. At the beginning of 1946, there were 375 cities served directly by air express. A general idea of the expansion of this service may be obtained by a comparison with 1940 when only 250 cities were thus served.

Reference to page 552 of the 1945 printing of THE AMERICAN YEAR BOOK will yield a tabular summary of annual air express operations up to and including the year 1943. The 1944 figures were as follows: express pounds 66,305,427, pound miles 34,285,353,551, and revenue $7,904,509. The 1945 figures available at writing were 49,000,000,000 pound miles and revenue $11,000,000. Express accounted for approximately 5 per cent of the total revenue.

FARES AND REVENUES

Passenger fares were reduced during 1945 to 4½ cents per mile, a 17.8 per cent reduction over the 5.1 cent average fare in 1944. The following tabulation lists the average fares for each year starting with 1930; included in the same table are shown the average miles per trip and the load factor:

Year	Passenger Fare Cents Per Mile	Average Miles Per Trip	Passenger Load Factor
1930......	8.3	224	....
1931......	6.7	226	....
1932......	6.1	268	42.34
1933......	6.1	352	46.87
1934......	5.9	407	51.82
1935......	5.7	420	54.83
1936......	5.7	427	64.01
1937......	5.6	432	57.55
1938......	5.7	415	58.74
1939......	5.1	400	62.08
1940......	5.1	388	63.84
1941......	5.0	367	64.40
1942......	5.3	417	76.11
1943......	5.5	476	90.01
1944......	5.1	571	90.83
1945......	4.5	562	88.76

The annual operating revenue for all domestic air mail carriers is tabulated on page 552 of the 1945 printing of THE AMERICAN YEAR BOOK. The operating revenue figures for 1944 were $95,262,342 from passengers, $27,949,987 from mail payments, $7,772,745 from express, and $2,809,828 from other sources. Percentage-wise, the revenue figures breakdown (after reserves for Federal taxes) into 72.54 per cent for passengers, 20.74 per cent mail, 4.98 per cent express, and 1.74 for other sources.

The expense dollar is distributed as follows: 49.1 cents for wages and salaries with 10.1 cents for flying personnel; 5.1 cents for repairs and material, 8.6 cents for fuel; 22.4 cents for rent, travel expenses, passenger supplies, etc.; 11.7 cents for taxes depreciation and insurance; and 3.1 cents for advertising and publicity. The operations of all of the domestic carriers are summarized in the accompanying table.

AIRPORTS

On Jan. 1, 1945, there were 1,215 Class 1 airports, 936 Class 2, 464 Class 3, and 812 Class 4 airports. The biggest percentage increase was 33 per cent for Class 1 with 24 per cent for Class 4 following. Class 1 is an elementary field with landing strips 1,800-2,700 feet long and suitable primarily for small personal aircraft. A Class 4 airport is one with runways 4,500-5,000 feet and is adequate for the largest aircraft now in use.

The National Airport Plan for the construction of 3,050 airports at an expenditure of $1,000,000,000 over a period of 10 years was still in Congress at the end of the year. Undoubtedly the situation is complicated somewhat by the 700 surplus airports awaiting disposition. Since the original bill required the creation of state aeronautics departments, most states now have some central body that may deal with the Government. In fact, most states are ready to go the moment any bill becomes law. Fortunately the work of the National Association of State Aviation Officials has resulted in general similarity of most of the organizations.

The Surplus Property Administrator, W. Stuart Symington, issued a statement outlining the conditions by which states, towns, or municipalities may obtain surplus airports. According to the statement, a state or municipality has the first chance to obtain any airport, and it may do so by agreeing to maintain the airport and to accord free rights to government planes. In case of national emergency, the Federal Government would again assume full control. Under these provisions, an airport would be given to the state gratis. If no state or municipality is interested, the airport is subject to sale or lease to any other applicant.

The principal reason for the deadlock in Congress on the Federal Airport Bill has been over the subject of channeling of funds. The question still revolves around the advisability of routing the funds through state aviation bodies. The details of the proposed bill are outlined on page 552 of the 1945 printing of THE AMERICAN YEAR BOOK.

AIRWAYS

The airway route mileage increased from 36,982 to 40,392 as of January 1945, of which a total of 34,424 miles were lighted. Additional navigational aids necessary for flying safety were added during the year in the form of radio range stations, radio marker beacons, and radio broadcast stations. Weather reporting, as well as traffic control facilities, were also expanded. However, the most important aids such as radar, the Loran navigational system, and various blind landing systems, all developed during the war and on the secret list until the end of the war, had not yet been universally applied to routine civil flying operations. The ability of radar to locate definitely in space airplanes, storm centers will result most certainly in a degree of control that should result in increased flying safety under the most difficult conditions. Even a local fog-dispersal system was demonstrated to the airlines during the year.

AIRCRAFT MANUFACTURE

The aircraft manufacturers really had a kaleidoscopic year. Up to V-J Day, practically all were still engaged in war work, although some substantial cutbacks had been made after V-E Day. On Aug. 14, 1945, contracts totaling $9,000,000,000 were cancelled, with a saving of approximately $7,000,000,000. Within two weeks, 450,000 employees joined the ranks of the unemployed. From a pre-war industry that employed 50,000, producing approximately 2,500 airplanes a year, the same nucleus was expanded to the largest industry in the world in 1944, with an annual production of nearly 100,000 airplanes. At the end of the year, the industry had shrunk to a position of 15th in this country.

At the end of the year, approximately a dozen types were in limited production, and most of the manufacturers were well on their way with the design of new civil aircraft or the conversion of their plants to civilian aircraft manufacture. Only four or five were in actual production of civilian airplanes, and these were in the 2-place cub types. At least three manufacturers of these types were each producing somewhere between 25 and 30 airplanes per day. This production was a continuation of the same types that had been used so well in the Army grasshopper circuits.

Personal aircraft manufacturers had orders on their books for 50,000 airplanes, whereas the maximum number of civil aircraft ever produced in one year was 6,844 in 1941. It has been estimated that 30,000 aircraft will be manufactured in 1946. The majority of the manufacturers were still in the tooling phase for the larger types of personal aircraft. The four-place airplane, powered with 150 horsepower, was very much in the spotlight as the forerunner of the practical size of a personal airplane. In fact, all surveys supported the belief that this size would predominate in the next decade. At the end of the year, it was estimated that the total employment in the manufacturing phase was 150,000, with expectations that it will not exceed 200,000 in 1946. The latter figure is still four times that of the best pre-war year. With the production know-how acquired during the war, it is expected that the 30,000 airplane figure for the year will be easily obtained.

From all indications the end of 1945 pointed to a large demand for all types of personal aircraft. Schedules and projections for 1946 were revised several times by practically all in the industry. The large number of pilots trained during the year, the large number who flew either as crew members or passengers, all of these contributed to the greatest demand for civil aircraft in history. The Civil Aeronautics Authority activities were planted in the direction of development of personal flying on a mass scale; 70,000 student pilot certificates were issued in 1945 compared with 30,000 for 1939, the last normal pre-war year. A further index was the increase in the number of registered civil aircraft which rose from 22,000 to 30,000 principally as a result of sale of surplus planes. However, the general consensus of opinion is that the sale of surplus airplanes will not hinder in any way the sale of the new models of civil aircraft which will appear on the market in quantity in the spring of 1946.

Another phase of aircraft manufacture which was in full swing at the end of the year was the conversion of several military transport types into airline transports. Approximately 1,000 such airplanes, all fundamentally proven types, were scheduled to be converted during the spring and summer of 1946. The famous C-54 four-engine type was most in demand, and it will be the first four-engine domestic transport in use in any quantity. The conversion of such a transport normally requires about two months and costs approximately $200,000. These conversions are only stop-gap equipment until the airlines receive more modern and efficient types in 1947. Still other manufacturers are building with a few modifications their standard pre-war airline transport types.

RESEARCH

The atomic bomb brought to dramatic focus the need for sustained research as insurance for our continued survival as well as peacetime prosperity. Coupled with the wartime applications of radar, jet, and rocket propulsion guided missiles and other developments not as spectacular, it is evident we are on the threshold of even more momentous discoveries. It has been generally conceded that our national interest requires that some scientific activity be provided for systematically as a part of our normal governmental functions.

The Pepper-Johnson-Kilgore bill before Congress proposes the establishment of a National Science Foundation which would examine all government-financed research and development activities and recommend to the agencies concerned and to the President such changes as appear desirable. It would also establish a Research Committee for National Defense and a Research Committee for Health and the Medical Sciences to approve all government military and medical research contracts. At least half of the Foundation's funds would be spent through contract with nonprofit educational and research institutions. The principal objective would be the maintenance of a certain level of research.

RADAR

The miracle of radar was revealed somewhat to the public after V-J Day. A demonstration of the various firms of radar equipment in use by the Army Air Forces was given to the industry representatives at Wright Field, Dayton, O. Its ability to detect the presence of aircraft, its ability virtually to map terrain not visible and its ability to locate and track storm centers make it one of the most valuable potential safety aids yet developed. Airport and airway traffic control will be a matter of observing a screen on which will appear in their proper relationship in space aircraft as far away as 25 miles. Radar's ability to spot storm centers has already resulted in much more reliable weather forecasting. Its application in blind landings has also been demonstrated, and this application developed for airline use should remove the last problem associated with no visibility.

CONTROL OF GUIDED MISSILES

The use of the V-1 and V-2 bombs during the war focused attention on the further development of guided missiles. The discovery of various other controlled missiles in Germany, yet in the experimental stage when the war ended, served to spotlight this even more. In fact, it is expected that such airborne weapons will be the backbone of the air force of the future. This has been recognized by the Army Air Forces and the Bureau of Aeronautics who have been given the responsibility for the control of procurement and production of such missiles, which depend primarily on aerodynamics forces. The commercial peacetime applications of remote control open up such vistas as automatic takeoff, flight, and landings of airplanes. Automatic landings have already been made in some of the transoceanic operations of the Air Transport Command.

JET-PROPELLED AIRCRAFT

The development of jet-propelled aircraft continued during the year and culminated in the P-80 fighter with speeds approaching 600 miles per hour. A new world's record was established at 606 miles per hour by one of the latest British jet-propelled types. The jet engine has made possible speeds hitherto impossible of attainment with the normal reciprocating gasoline engines. While jet-powered commercial air transports are still several years hence, it is now evident that cruising speeds above 400 miles per hour will be obtained only by means of jet engines. The compactness of the units, the elimination of propellers and their controls, and the fact that the efficiency increases with speed, dictates that any designs of the future with required cruising speeds in excess of 400 m.p.h. must be of the jet-propelled type.

ROCKET PROPULSION

Rocket propulsion developed to the highest degree by the Germans in their frantic attempt to intercept our bombers is also coming in for its share of attention. Since it does not need oxygen it is in that respect the ideal high altitude means of propulsion. Its immediate application appears to be in the form of J.A.T.O., which means jet assisted takeoff. This consists of several rockets whose energy is used during the takeoff run to permit the carrying of heavier loads or simply the reduction of the distance for takeoff. The heavily loaded cargo airplane of the future will certainly use J.A.T.O. Its greatest development in this country for takeoff facilitation was one of our secret weapons. The use of rocket power for aircraft has not yet reached the point where it has the degree of safety and control required for commercial operations.

RESEARCH IN PRESSURES AND EFFECTS ON THE HUMAN BODY

Research in the physiological effects on the human body of exposure to reduced temperatures, pressures have also yielded valuable data in connection with the pressurization of aircraft. The success of the B-29's was owing in no small measure to its pressurized cabin and the ability of the crew to withstand the long flights. The controlled pressure and temperature of the cabin insured maximum operating efficiency of the crew. The study of the effect of accelerations upon the human body resulted in the development of a G suit for pilots which gave them a definite advantage in combat. All of these high altitude investigations are reflected in the latest designs on the boards for the new global liners due to make their appearance in two or three years on American-operated routes.

PART FIVE

SOCIAL AIMS AND CONDITIONS

DIVISION XIV

POPULATION AND MIGRATION

POPULATION STATISTICS

By Leon E. Truesdell
Chief, Population Division, U. S. Bureau of the Census

POPULATION GROWTH

The population of the United States on July 1, 1945, including persons in military service abroad, was estimated at 139,621,431. This figure represents an increase of 1,537,982, or 1.11 per cent, over the estimate for July 1, 1944. The increase, it may be noted, is slightly less than the increase in the preceding year and materially less than the increase (1.36 per cent) in 1943, which was the largest in any recent year. These estimates are presented for July 1 of each year from 1940 to 1945 in Table 1, together with estimates for each month of the most recent year. The estimates of increase since the 1940 Census are based on statistics of births, deaths, and net immigration for the period subsequent to the Census. Data for births and deaths have been adjusted for under-registration, and the figures for deaths include both combat and non-combat deaths of servicemen overseas.

The population estimated for July 1, 1945, represents an increase of 7,952,156, or 6.04 per cent, over the 1940 Census figure. A provisional estimate of the total population for Oct. 1, 1945 is slightly over 140,000,000; if the present monthly rate of increase is continued until April, 1946, the accumulated increase for the six years following the Census will then be approximately equal to the entire increase of 8,894,229 between the Censuses of 1930 and 1940. The chief source of the accelerated rate of population increase is the wartime rise in the birth rate. Though the birth rate has shown a tendency to decline somewhat since 1943, the level is still considerably higher than at any time between 1930 and 1940, and it bids fair, as indicated later, to remain relatively high for at least the next two or three years.

The total increase in population, between April 1, 1940 and July 1, 1945, was made up primarily of the excess of births over deaths, which amounted to 7,358,047, though net immigration contributed 594,109. While immigration still represents a minor part of the total, the current figures do show the increasing importance of immigration as a source of population growth, as compared in particular with the decade 1930-40, during which its contribution was a minus quantity. The figures representing net civilian immigration, as shown in Table 1, result from computations involving arrivals and departures of both aliens and citizens. The data may be considered in three

TABLE 1

ESTIMATED POPULATION OF CONTINENTAL UNITED STATES INCLUDING ARMED FORCES OVERSEAS: JULY 1, 1940 TO 1945

Date	Estimated Population	Increase Since Preceding Date		Gain or Loss in Preceding Period			
		Number	Per Cent	Births[1]	Deaths[1]	Excess of Births Over Deaths	Net Civilian Immigration

[1] Estimated total, including adjustment for under-registration.

groups: (1) alien immigrants and emigrants; (2) alien non-immigrants and non-emigrants (for example, government officials, temporary visitors, and persons in transit through the United States); and (3) citizens of the United States. The first group is the smallest, both in gross movement and in net resultant. Figures for the whole period from April 1, 1940, to July 1, 1945, are:

Arrivals	1,696,730
Immigrant aliens	187,327
Non-immigrant aliens	552,375
Citizens of the United States	957,028
Departures	1,102,621
Emigrant aliens	43,890
Non-emigrant aliens	367,403
Citizens of the United States	691,328
Excess of arrivals over departures (net immigration)	594,109
Immigrant aliens	143,437
Non-immigrant aliens	184,972
Citizens of the United States	265,700

Estimates of the population actually in continental United States, excluding armed forces overseas, and estimates of the civilian population for July 1 of each year from 1940 to 1945 are presented in Table 2.

The first set of estimates reflects the movement of troops overseas during the war period. The net decreases shown for the years ended July 1, 1944 and July 1, 1945, indicate the extent to which these movements exceeded the natural increase in the population. Statistics available for six-month periods indicate that the decrease in the population in continental United States began in the last half of the fiscal year 1943 (though the year as a whole shows a slight increase) and that the decrease in the fiscal year 1945 was confined entirely to the first half of the year, the period from Jan. 1 to July 1, 1945, showing an increase of around 300,000, as the war came to an end and large numbers of men were returned from the war areas.

The second set of estimates in Table 2 shows the effects of the whole military induction program on the civilian

TABLE 2

ESTIMATED POPULATION OF CONTINENTAL UNITED STATES EXCLUDING ARMED FORCES OVERSEAS, AND ESTIMATED CIVILIAN POPULATION: JULY 1, 1940 TO 1945

Date	Population	Increase (+) or Decrease (−) Since Preceding Date	
		Number	Per Cent
Estimated Population Excluding Armed Forces Overseas			
July 1, 1945	131,975,774	−576,231	−0.43
July 1, 1944	132,552,005	−1,414,314	−1.06
July 1, 1943	133,966,319	+195,819	+0.15
July 1, 1942	133,770,500	+710,455	+0.53
July 1, 1941	133,060,045	+1,105,901	+0.84
July 1, 1940	131,954,144	—	—
Estimated Civilian Population			
July 1, 1945	127,409,297	+873,123	+0.69
July 1, 1944	126,536,174	−874,183	−0.69
July 1, 1943	127,410,357	−3,464,553	−2.65
July 1, 1942	130,874,910	−682,820	−0.52
July 1, 1941	131,557,730	−101,556	−0.08
July 1, 1940	131,659,286	—	—

population. The net decreases again represent the excess of inductions over natural increase. During the last half of the calendar year 1945, that is, subsequent to July 1, 1945, the latest date shown in the table, the civilian population has, of course, been increasing rapidly with the reduction in the military forces. The number of persons in military service in July, 1945, which was approximately the maximum, was somewhat over 12,000,000; in November, 1945, the number had been reduced to around 9,000,000.

All of the estimates in Tables 1 and 2 are presented to the last digit, as computed, instead of being rounded, not because they are assumed to be accurate to the last unit, but for convenience in summation.

BIRTH AND DEATH RATES

As already indicated, the recent rise in the birth rate has been the principal factor contributing to the acceleration in the rate of population growth. During the calendar year 1944, there were 2,969,000 births (including estimates for under-registration). This represents a decided increase as compared with the average of about 2,400,000 per year which prevailed from 1930 to 1940, but is materially smaller than the maximum of 3,159,000 in 1943. The rate prevailing in 1944 was approximately maintained throughout the year 1945, preliminary totals for the first ten months of 1945 being only slightly below the figure for the corresponding months of 1944. It is evident, then, that while the birth rate has shown a tendency to decline somewhat since 1943, the decline has been moderate and the level is still considerably higher than at any time between 1930 and 1940. It is expected that, with the return of servicemen from overseas and rapid demobilization, the birth rate may take another upswing and continue at current or somewhat higher rates for two or three more years. While the birth rate in recent years has been relatively high, the death rate has shown little increase over the average for the preceding ten years. Even military mortality, which amounted in total to around 300,000, has not been sufficient to raise the number of deaths in any one year by more than about 150,000.

The most significant data on births and deaths which need to be considered in any study of trends in population growth are presented in Table 3, which gives for each year from 1920 to 1944 the number of registered births and deaths, the annual rate per thousand of the population based on registered data, and estimated totals, including both adjustments for under-registration and, for years prior to 1933, estimates for non-registration states; and in the final column the excess of births over deaths, frequently termed the natural increase.

POPULATION BY STATES

The population actually resident in the Northeastern States decreased by 4.8 per cent between 1940 and 1945; the population of the North Central States likewise decreased by 3.4 per cent, while the population of the Southern States increased 2.1 per cent and the Western States (including the Mountain and Pacific divisions) increased 18 per cent. Among the individual states, California showed by far the largest increase, the gain amounting to 1,915,301, or 27.7 per cent, while New York, with a loss of 894,229, or 6.6 per cent, showed the greatest loss. Estimates of the population on July 1, 1945, are presented by states in Table 4, with 1940 Census figures for comparison. In considering the figures in the table, it should be kept in mind that, by the middle of 1945, the movement of troops overseas had almost equaled the natural growth of population since 1940, so that the population of the United States as a whole, excluding armed forces overseas, was only 0.2 per cent larger than in 1940. This means that the decreases in many states were largely the result of the induction of men of military age for overseas serv-

TABLE 3

BIRTHS AND DEATHS IN THE UNITED STATES: 1920 TO 1944

(Registration for years prior to 1933 are for the current registration area. The birth registration states in 1920 included 59.7 per cent of the total population of the country and the death registration states 80.9 per cent, these areas gradually expanding until complete coverage was attained in 1933.)

Year	Births Registered		Deaths Registered		Estimated Totals, Including Adjustment for Under-registration

ice, rather than of extensive migration to other states.

FARM POPULATION

Between April, 1940, and January, 1945, civilian migration, inductions and enlistments brought about a net loss of 5,286,000 from the farm population, according to the results of a survey of 30,000 representative households in 43 states. By far the largest part of this estimated loss was owing to the migration of farm people to cities, towns, and villages, primarily to centers of war production. This figure represents the net result of migration from farms to non-farm areas, partly offset by migration from urban areas to farms. An independent survey indicates that this reverse movement was approximately equal to one-half the movement off farms. Another important part is represented by the loss of about 1,500,000 men who left the farms for military service. In this connection it may be noted that the entire civilian population of the United States in January, 1944, was less by about 4,374,000, or 3.3 per cent, than in April of 1940. The changes in the civilian population living on farms are indicated in Table 5.

EMPLOYMENT

On a basis of reports obtained each month from a representative sample of households in various parts of the country there have been published every month since March, 1940, estimates of the number of persons in the civilian labor force, the number employed, and the number unemployed. These figures are summarized by months from July to December, 1945, and for July of each year from 1940 to 1945, in Table 6. It may be noted that two different sets of figures are shown in Table 6 for July of 1945, one for the end of the annual series and another, somewhat larger, for the beginning of the monthly series. The larger figures result from a new enumerative procedure adopted in that month which has the effect of making the term "labor force" somewhat more inclusive. Figures for earlier dates, adjusted so as to be comparable with the results of this new procedure, are in preparation.

The figures presented in Table 6 for the last six months of the year 1945 show very definitely the effects of the demobilization of the armed forces and of the reconversion of productive activities to a peacetime basis. Between July and December, the number of persons in the civilian labor force decreased by nearly 2,000,000, this being the net result of an increase of about 1,000,000 in the number of males in the labor force and a decrease of about 3,000,000 in the number of

TABLE 5

CIVILIAN POPULATION LIVING ON FARMS: 1945 AND 1940

Age and Sex	Jan. 1, 1945 (estimate)	Apr. 1, 1940 (census)	Decrease, 1940 to 1945	
			Number	Per Cent
Total farm population, excluding institutions	24,960,000	30,394,000	5,286,000	17.4
Both Sexes:				
All ages	24,960,000	30,394,000	5,434,000	17.9
Under 14	7,730,000	8,940,000	1,210,000	13.5
14 years and over	17,230,000	21,454,000	4,224,000	19.7
Male:				
All ages	12,500,000	16,011,000	3,511,000	21.9
Under 14	3,960,000	4,562,000	602,000	13.2
14 years and over	8,540,000	11,449,000	2,909,000	25.4
Female:				
All ages	12,460,000	14,383,000	1,923,000	13.4
Under 14	3,770,000	4,378,000	608,000	13.9
14 years and over	8,690,000	10,005,000	1,315,000	13.1
Percentage of total civilian population living on farms	19.8	23.2	—	—

females. The number of unemployed increased during this five-month period from 950,000 to 1,950,000, all of the increase being in the number of male unemployed, with the number of female unemployed remaining constant at just under 500,000. The number of employed persons decreased from 54,270,000 in July, 1945, to 51,360,000 in December, this decrease of about 3,000,000 being entirely in the number of female workers, with practically no change in the number of employed men.

To some extent, the changes just referred to are affected by seasonal changes in agriculture, the number of males employed in this industry decreasing from 7,130,000 in July to 5,990,000 in December, while the number of females employed in agriculture decreased even more sharply, from 2,710,000 to 1,200,000. Even in non-agricultural employment there was a decrease in the number of employed women, from 16,900,000 in July, 1945 to 15,510,000 in December, while the number of men employed in non-agricultural industries increased something over 1,000,000 from 27,530,000 to 28,660,000.

The number of unemployed, which has been very low for several years, showed an increase of about 1,000,000 between the low point reached in August, 1945 and December, 1945, this increase resulting mainly from the addition of veterans returning from overseas to the group of persons seeking employment. The December unemployment figure, which is just short of 2,000,000, is far lower than the figure for unemployment forecast a few months ago for this stage in the reconversion period. Some allowance may be made for the fact that many returning veterans seem to have delayed for some weeks active efforts to obtain employment, though even with the assumption that many thousands of these veterans will shortly be added to the labor force, the figures seem definitely to indicate more satisfactory progress in re-employment than even the most optimistic forecasters had anticipated.

One other figure given in recent monthly reports on employment and unemployment is that representing the total labor force, including the armed forces, which stood at 61,160,000 in December 1945 as compared with 67,500,000 in July 1945. Approximately half the difference between these two figures is represented by the decrease of about 3,000,000 in the number of

TABLE 6

ESTIMATES OF EMPLOYMENT STATUS OF THE CIVILIAN POPULATION OF THE UNITED STATES: 1940 TO 1945

(institutional population excluded)

women in the labor force, on which comment has already been made, and the remainder represents mainly the demobilization of the armed forces. This combined figure, including persons in military service, is most significant, perhaps, as a starting point for any forecast of the future labor force or, for example, for consideration of the problems involved in the "60,000,000 jobs" which have been proposed as a goal to which we should look forward in 1950.

AGE AT MARRIAGE

It is frequently assumed that, with the increase in the time spent in school, marriage is deferred until a later age. Figures recently compiled in the Census Bureau indicate, however, that this is not the case—that, in fact, the average or median age at marriage has been actually declining over the 50 years for which figures are available. Specifically, the median age at first marriage for men declined from 26.1 years in 1890 to 24.3 years in 1940; and median age at marriage for women, while it has shown no considerable decline, has at least not increased, the figures being 22 years in 1890 and 21.6 years in 1940. The medians for both men and women are presented in Table 7.

TABLE 7

MEDIAN AGE AT FIRST MARRIAGE, BY SEX: 1890 TO 1940

Census Year	Male	Female
1940	24.3	21.6
1930	24.3	21.3
1920	24.6	21.2
1910	25.1	21.6
1900	25.9	21.9
1890	26.1	22.0

MARRIAGES, 1939 TO 1945

The most satisfactory index now available with respect to current changes in the number of marriages is provided by a monthly report to the Census Bureau of the number of marriage licenses issued in the 92 cities which had a population of 100,000 or more in 1940. The number of marriage licenses issued in all of these

TABLE 8

MARRIAGES IN LARGE CITIES AND IN THE UNITED STATES AS A WHOLE: 1939 TO 1945

Area and Year	Total	Increase (+) or Decrease (−) in Preceding Year	
		Number	Per Cent
Marriage Licenses Issued in Cities of 100,000 or Over:*			
1945	568,713	+55,566	+10.8

[1] Per cent of persons single at beginning of year of age who marry during the year. This figure indicates the chance of marriage within one year from attaining the specified age.

[2] Per cent of persons single at beginning of year of age who marry in that year and all later years. This figure indicates the total chance of marriage for persons who have attained the specified age.

[3] Per cent single in age group 40–44, 45–49, etc.: data for single years not available.

cities combined increased from 408,989 in 1939 to an all-time peak of 594,908 in 1942, and then fell steadily through 1943 and 1944. The annual total of 513,147 reported for 1944 was still 25.5 per cent higher, however, than that for 1939; and by reason of a fairly rapid increase in the monthly figures for the last half of the year, the total for 1945 reached 568,713, or within a few per cent of the 1942 maximum. Changes in the estimated number of marriages performed in the United States as a whole follow the same pattern as the recorded changes in the large-city figure, with a maximum in 1942, and decreases in 1943 and 1944, and a substantial increase indicated by preliminary figures for 1945. The data for both the United States and the large cities are summarized in Table 8.

MARRIAGE PROSPECTS OF SINGLE MEN AND WOMEN, BY AGE

The Census Bureau has recently compiled tables based on marriage and death statistics, showing the chances of marriage year by year and the total chances of eventual marriage for persons of each age. Significant figures based on these tables are summarized in Table 9.

The first two columns of the summary table indicate, year by year, the "normal" chances of marriage within a year's time for single persons attaining successive years of age, the first column giving figures for males and the second for females, based on data for the period 1920 to 1939. According to these figures, the year of age in which the largest percentage of single women are married is 23 and for single men, 26 or 27. As indicated, 21.3 per cent of the single women attaining age 23 are married within a year, and likewise 17.3 of the single men attaining age 26. From these high points the percentages married in the current age year decline rather slowly with increasing age, dropping below 8 per cent for women at age 32 and for men at age 36. It should be noted, however, that these percentages are based on the rather rapidly declining number of men and women remaining single. This decline is indicated by the figures in the last two columns of the summary table.

The approximate percentage of the whole number of persons of a given age who marry within any specified age-year may be obtained by multiplying the percentage which appears in the first section of the table by the percentage single shown in the third section. For example, the figures indicate that 5.9 per cent of the single women aged 34 marry within the year, but since these single women constitute only 12.6 per cent of the whole number of 34-year-old females, the

* Less than one year of school completed.

number who marry in this year will form only 0.7 per cent of the entire 34-year age group.

The summary table shows also, in the third and fourth columns, the percentage of those persons remaining single at any given age who may expect ever to marry, this being the sum of the numbers expected to marry in the current year and all later years. This figure stands at a maximum at the beginning of what might be considered the marriageable ages, 19 years for males and around 16 years for females. Thereafter, the probability of eventual marriage decreases, slowly at first and then rapidly, although it should be noted that the number of single persons to whom the percentages apply becomes very small after the first 15 or 20 years of the series. By age 65, less than one out of 100 spinsters and less than two out of 100 bachelors may expect to marry, but at this age only about 10 per cent of the population, either male or female, remains single.

EDUCATION BY MONTHLY RENTAL VALUE OF HOME

Some indication of the relation between educational attainment and family income may be obtained from data based on the 1940 Census, in which the number of years of school completed is shown for school ages, year by year, classified in accordance with the monthly rental value of the home in which the children lived. Monthly rental value of home has proved to be a fairly satisfactory index of family income, though figures are available only for urban and rural-non-farm homes. By way of illustration, data are presented in Tables 10 and 11 for the educational attainment of boys and girls 10 years of age in various areas, classified by monthly rental value of home. In Table 10 the results of the classification are summarized in the form of medians, the median representing the number of years of school completed by the boy or girl who would stand at the middle of the series if the whole number were arranged in order according to educational attainment. Table 11 shows the actual distribution of the whole number of 10-year old native white boys and girls in urban and rural-non-farm areas in the United States.

In making any comparisons between the medians shown in Table 10 and the distribution shown in Table 11, it is necessary to keep in mind the fact that the distribution is in terms of completed years, while the medians are expressed in decimals representing tenths of a year. For example, the number of persons shown as having completed four years of school includes not only those who have completed exactly four years but also all those who have completed, in addition, any fraction of a year—that is, up to 4.9 years. A median of 4.4, then, does not indicate a point beyond the limits of the four-year group, but rather a position within that group.

The relation between family income as indicated by monthly rental value of home and educational attainment stands out clearly in the series of medians, the totals for ten-year-old boys indicating 3.7 years of school completed in the lowest income group and 4.6 years in the highest income group, with similar relations in the figures for girls. The differences in the medians shown for urban areas and rural-non-farm areas are, in general, rather small, this resulting partly, perhaps, from the fact that, for a given rental value, better home accommodations can be obtained in rural areas than in large cities.

SOURCES OF ADDITIONAL DATA

Additional information on the topic discussed just above is contained in a brief population report entitled "Educational Attainment of Children by Rental Value of Home."

Current estimates of labor force, employment, and unemployment, are contained in the "Monthly Report on the Labor Force."

Current estimates of population are issued from time to time; a release giving estimates by states for July 1, 1945 is to be available early in 1946.

A circular describing both the reports of the 1940 Census and the current material, which has been published since the Census, may be obtained upon request from the Bureau of the Census, Washington 25, D. C.

RACE CONDITIONS IN THE UNITED STATES

By Clyde V. Kiser
Technical Staff, Milbank Memorial Fund
and
Louise K. Kiser
Office of Population Research, Princeton University

GENERAL

The ending of the war brought a crucial period with respect to race relations in this country. Immigration quotas are being examined by a Congressional committee with the view toward possible changes of policy. Some 100,000 Japanese are now trying to re-establish a normal life and livelihood after being uprooted from their homes, placed in relocation centers for several years, and then released. Thousands of Negroes who advanced to good jobs in war industries are wondering how they will fare in peacetime industry. Hundreds of thousands of Negro youth are being demobilized and are beginning life anew as veterans of the Second World War. We have yet to see to what extent our treatment of minority groups will be consistent with the principles of democracy for which we fought.

IMMIGRANT ADMISSIONS

According to provisional figures reported in the December, 1945 issue of the *Monthly Review* of the Immigration and Naturalization Service, 38,119 immigrant aliens were admitted to this country during the fiscal year ended June 30, 1945, a substantial increase over the preceding year, when only 28,551 were admitted.

Not since the fiscal year ended June 30, 1930, have as many as 100,000 immigrant aliens been admitted to the United States in any one year. In the summer of that year, consuls were instructed to deny visas to individuals deemed likely to become public charges, a ruling prompted by depression conditions in this country. As a result, the number of admissions dropped sharply and reached the lowest level in over a century in 1933, when only 23,068 were admitted. With the accession of Hitler in Germany and the consequent fleeing of refugees from Nazi-dominated countries, the number of aliens admitted to this country climbed gradually and reached a peak of 82,998 in 1939. The Second World War brought another sharp curtailment, especially after this country became involved, and during 1943 the number of admissions was only 23,725, or only slightly higher than the low figure for 1933.

GEOGRAPHIC ORIGINS

The decrease in the total flow of immigration since the outbreak of the war has been accompanied by a marked change of origins from Europe to the Western Hemisphere. In 1939, European countries were given as the last permanent residence by 76 per cent of the immigrant aliens admitted to this country, and countries of the Western Hemisphere were reported by only 21 per cent. By 1943, virtually these same percentages were reversed, *i.e.,* 21 per cent reported European countries and 77 per cent reported countries of the Western Hemisphere. In 1945, only about 16 per cent of the immigrant aliens reported European countries and 75 per cent reported countries of the Western Hemisphere.

To take specific countries, 33,515 or 40 per cent of the total immigrant aliens admitted in 1939 reported Germany as the last permanent residence. Only 238 gave this report in 1944 and 172 in 1945. This was a natural consequence of the war. The proportion of immigrant aliens reporting Canada as the country of last permanent residence was only 13 per cent in 1939, 40 per cent in 1943, 34 per cent in 1944, and 29 per cent in 1945. In absolute numbers, however, there was a decline from 10,501 in 1939 to 9,571 in 1943, and then an increase to 9,821 in 1944 and to 11,079 in 1945. The numerical and proportionate importance of immigrant aliens from Mexico is also larger than in 1939. At that time, only 3 per cent of the immigrant aliens reported Mexico as the country of last permanent residence. This proportion was 18 per cent in 1943, 23 per cent in 1944, and 18 per cent in 1945. The absolute numbers were 2,640 in 1939, 4,172 in 1943, 6,598 in 1944, and 6,702 in 1945.

The above data concerning last permanent residence exaggerate somewhat the declining proportionate importance of European origins since 1939. Actually, some of the immigrants reporting Western Hemisphere countries as last permanent residence were secondary migrants from Europe. Nevertheless, the distributions by country of birth give essentially the same story. In 1939, 82 per cent of immigrant aliens were natives of Europe, and 16 per cent were natives of the Western Hemisphere. In 1943, the respective proportions were 38 and 60; in 1944, they were 30 and 66; and in 1945, they were 27 and 66. In 1939, only 10 per cent of the immigrant aliens were natives of Canada, as compared with 30 per cent in 1943, 25 per cent in 1944, and 23 per cent in 1945. Natives of Mexico comprised 3 per cent in 1939, 17 per cent in 1943, 22 per cent in 1944, and 17 per cent in 1945. It should be emphasized, too, that the above figures relate to Mexican immigrant aliens entering the country through regular immigration channels for declared permanent residence. This immigration is quite apart from the special importation of Mexicans since 1943 for temporary residence as farm laborers and track workers, discussed in a later section.

DEPARTURES AND DEPORTATIONS

The number of emigrant aliens departing during the fiscal year ended June 30, 1945 was 7,442. Like the wartime trend in number of admissions, the number of emigrant aliens departing reached its lowest level (5,107) in 1943 and has since increased. Of the total emigrant alien departures in 1945, 41 per cent were destined for Great Britain, 16 per cent for Mexico, and 8 per cent for Canada. The number of deportations during 1945 was 11,270. Over 8,000 of these were Mexican nationals.

NATURALIZATION

The number of naturalizations during the fiscal year 1945 was 238,450, a sharp cut back from the all-time maximum of the preceding year when the total civilian and military naturalizations reached 441,979. The reversal in 1945 was forecast by immigration authorities a year earlier, since the large number of naturalizations in 1944 represented in part an elimination of arrearages, since recent immigration had been low in volume, and the number of declarations of intention to file petitions dropped to the lowest point on record in 1944, when the number was only 42,368 as compared with 115,664 in 1943.

Class instruction for aliens in the history, government, and basic ideologies of the United States has long been part of the educational program of the Immigration and Naturalization Service. Since the beginning of the war, home-study courses have been organized to meet the needs of aliens who live in rural areas where no class facilities are available and those otherwise unable to attend organized classes. By July 1, 1945, the program was in operation in 38 states, and in six others plans were being made to establish such home-study courses in the fall.

RESIDENT ALIEN POPULATION

As a consequence of the large volume of naturalizations and the small volume of immigration, the number of resident aliens in this country declined sharply during the war. A total of 4,889,770 aliens registered under the compulsory national registration between Aug. 27, and Dec. 26, 1940. A recent estimate by Ernest Rubin of the Immigration and Naturalization Service places the number at about 3,050,000 as of July 1, 1945, indicating a decline of about 38 per cent. Rubin states that during the period under consideration, the number of aliens "was increased by a net immigration of 110,000 and decreased by over 1,427,000 naturalizations, 374,000 deaths, and 148,000 from other causes" (*Monthly Review*, October, 1945).

ADMISSION OF FOREIGN STUDENTS

Section 4 (e) of the Immigration Law of 1924 provides for the admission of students. These are classified as non-immigrants since they are admitted for only temporary residence. From July 1, 1924, through June 30, 1945, over 35,000 alien students took advantage of this provision, according to the November, 1945, *Monthly Review* of the Immigration and Naturalization Service. As with total immigration to the United States, student admissions dropped to a low level (877) in 1933 but then rose each year until a pre-war maximum of 2,451 admissions was attained in 1938. From that date, the annual number declined consistently until 1943, when 1,021 were admitted; this was followed by an abrupt rise to 1,643 in 1944 and to 2,866 in 1945. The number for 1945 included 2,010 from countries of the Western Hemisphere, 559 from Asia, 244 from Europe, and 53 from other places.

The constituency of alien students has changed markedly since the inception of the program. During fiscal years 1925-1933, about 56 per cent were natives of European countries, but during 1934-1939 this proportion was only 35 per cent, and from 1940 through 1945 it dropped to 15 per cent. The proportion of Asiatic students also declined, being 33 per cent, 25 per cent, and 15 per cent, respectively. In contrast, the proportion of the foreign students from Canada, Newfoundland, and Latin-American countries increased from 6 per cent in the 1925-1933 period to 36 per cent during 1934-1939, and to 67 per cent during 1940-1945. Over the entire period, however, China sent more students (5,168) than any other single country. Only in 1943 did the annual number of immigrant students of Chinese birth fall below 100. Japan sent 150 to 250 per year during 1926-1932, but never as many as 100 per year after 1932.

PRESIDENT TRUMAN'S PLAN TO AID THE ENTRY OF REFUGEES

On Dec. 22, 1945, President Truman announced his plan to aid displaced persons and refugees now in the American zones of occupation in Europe by admitting a maximum of 3,900 per month to this country. He stated that this number is the approximate quota allotted under present laws to countries of "central and eastern Europe and the Balkans," so no revision of the law would be needed. To expedite the plan, the President requested special help from the Secretaries of State and War, the Attorney General, the War Shipping Administrator, the Surgeon General of the Public Health Service, and the Director General of the United Nations Relief and Rehabilitation Administration. Representatives of these officials have already gone to Europe to make preliminary preparations. The President expressed the hope that the plan would be in actual operation by the spring of 1946 and that the admissions would be distributed fairly by faith, creed, and nationality, with special preference being given to orphaned children.

IMPORTED FOREIGN WORKERS

The end of the war and the return of servicemen to civilian life bring to a close the wartime emergency program under which the United States has been importing workers from certain Western Hemisphere countries to relieve the labor shortage. (See previous issues of THE AMERICAN YEAR BOOK.) According to the latest report from the Immigration and Naturalization Service, 354,896 laborers had been admitted up to June 30, 1945. Since many have been repatriated, the number remaining at the end of the fiscal year was 181,757; of these, 99,434 were agricultural laborers, 64,990 were railway track workers, and 17,333 were in industry (*Monthly Review,* December, 1945).

During 1945, as in previous years, the number of admissions varied from month to month, as contracts expired and labor needs changed. On Dec. 1, 1945, there were 35,892 foreign workers employed in agriculture: 25,324 Mexicans, 5,367 Jamaicans, 4,294 Bahamians, and 907 Newfoundlanders. As in former periods, most of the Mexicans were found in California, the Jamaicans in the East, particularly in Florida and in Ohio, and Michigan; the Bahamians in Florida and the Newfoundlanders in New England and New York (Bureau of Agricultural Economics, Department of Agriculture: *Farm Labor,* Dec. 14, 1945).

The admission of Mexican nationals for work on the railroads proceeded at an increased tempo during the first six months of 1945. The quota of Mexicans who might be employed in railroad work at any one time was raised from 50,000 as of July, 1944, to 75,000 as of March, 1945. The number of employers using Mexicans rose from 29 to 35, and the imported workers were allowed to engage in a wider variety of tasks connected with the railroads. At the end of August 1945, about 135,300 Mexicans had been brought in for railroad work since the beginning of the program in 1943. Contracts in effect at the end of that month numbered approximately 59,400 (Railroad Retirement Board: *Monthly Review,* October, 1945).

In the industrial field, a total of more than 20,000 West Indian Negro workers, most of them from Jamaica, were brought into the country by the War Manpower Commission. These workers were placed in foundries and other industrial establishments on the East Coast and in Wisconsin, Ohio, and Illinois (Sadler, G. E.: "Wartime Utilization of Jamaicans in U. S. Industrial Establishments," *Monthly Labor Review,* November, 1945).

Since the end of hostilities with Japan, recruitment of laborers has been suspended, and plans have been made for the repatriation of workers already in this country as soon as their contracts expire. Many of the workers, lured by the prospect of higher wages, wider economic opportunities, and higher standards of living, are unwilling to return to their native land and now wish to remain in this country. However, the agreements signed by the United States and the countries involved stipulate clearly that all workers are to be returned at the expiration of their labor contracts.

Mexican nationals have played by far the most important part in this program of imported labor. The history, administration, and results of the program are described in a report by Robert C. Jones, "Mexican War Workers in the United States," published by the Pan American Union in 1945. In summarizing the results of this wartime undertaking, Jones states: "The contribution [of the Mexican laborers] has been even more important than the number of workers might indicate, for the men have been used to meet peak needs where no other source of labor was immediately available. . . . The programs of recruiting and transporting Mexican nationals to the United States to help in agricultural production and railroad maintenance-of-way work during the period of the war have deservedly been described as important steps in inter-American cooperation."

The Railroad Retirement Board, the agency responsible for the handling of railroad workers, also feels that "the contribution of the Mexican national workers to the United States war effort can not be over-estimated. The willingness of . . . our friends across the border to offer their services to United States railroad employers has helped to solve one of the country's biggest problems. Without the use of Mexican national manpower, United States railroads would have found it difficult, if not impossible, to meet the increased responsibilities thrust upon them by a world at war" (Railroad Retirement Board: *Monthly Review,* June, 1945).

RESETTLEMENT OF JAPANESE EVACUEES

The closing of the war relocation centers and the resettlement of the Japanese who were evacuated from the West Coast in 1942 have been natural results of the War Department's revocation of the order excluding persons of Japanese ancestry from West Coast military areas, and also of the Supreme Court's decision that Japanese Americans of unquestioned loyalty could not be detained in relocation centers. At the time that the revocation of the exclusion order became effective, Jan. 2, 1945, there were about 80,000 persons still concentrated in eight relocation centers and in Tule Lake, the center in which were located the disloyal Japanese and those who had expressed a wish to be returned to Japan. (This group has now been placed under the jurisdiction of the Department of Justice.)

The closing of the relocation centers and the resettlement of the evacuees was virtually completed by the end of 1945. According to a statement contributed by Dillon S. Myer, Director of the War Relocation Authority: "The War Relocation Authority closed the last of its eight remaining relocation centers November 30, 1945, carrying out its announced intention of doing so within a year of the lifting on January 2, 1945, of the Army's exclusion of persons of Japanese ancestry from the West Coast.

"Before lifting of the exclusion, nearly 20 per cent of those now relocated away from the evacuation area already had settled in Illinois, between 5 and 10 per cent in Colorado, Utah and Ohio, with less than 5 per cent in each of the other states and the District of Columbia. Eastern resettlement has been most heavily concentrated in and near New York, Philadelphia, Bridgeton, N. J., Detroit, Chicago, Minneapolis, Denver and Salt Lake City.

"Of the original 110,000 evacuated

from California, Oregon, Washington and southern Arizona, about 45,000 returned to the West Coast states directly from Centers. Another 5,000 had returned by the end of 1945 from more easterly localities to which they had relocated before the lifting of the ban. The rest of the relocated population remained east of the Sierra Nevadas, and at the first of the year some 7,000 were still at Tule Lake, the WRA-operated 'segregation' center in northern California. The number of these eligible for relocation had not been determined by the Department of Justice."

Since the exclusion ban was lifted both evacuees and their Caucasian friends have expressed the fear that the return of Japanese to the West Coast would result in a wave of prejudice and hostility similar to the anti-Japanese hysteria of 1942. Opposition to their return has centered chiefly in the farming areas, in the produce-marketing interests of Los Angeles and Seattle, and in certain political circles. According to Myer: "Small but highly organized groups opposed the return of evacuees to the Coast, particularly during the spring and early summer of 1945. Among groups dealing in agricultural produce, commercial boycotts were widespread against returnees in some localities. In May and June of 1945, when substantial numbers of evacuees began to come back, hostility reached a peak. A wave of terrorism swept California, including some 39 instances of arson, shooting attempts, dynamiting, property damage and threats of physical violence. Law enforcement in some communities tended to be lax in counteracting this terrorism, until protest against this type of opposition toward returnees became nationwide. Fair-minded groups, individuals, and newspapers condemned the intolerance through resolutions, public statements, letters, and editorials. Boycotts and minor instances of active hostility tapered off but did not entirely cease by the end of 1945. Isolated and sporadic instances of discrimination remained a problem for Issei and Nisei in spite of a somewhat improved general attitude toward them on the Coast. A major factor in countrywide acceptance of America's Japanese was widespread knowledge that 22,500 Nisei, over half of them from the mainland, had served with the American armed forces on every fighting front. One of their outfits, the 442nd Regimental Combat Team, won national acclaim as 'the most decorated unit in the military history of the United States.'" In recent months the public has also become aware of the invaluable assistance rendered by those Nisei who were trained at a military intelligence language school at Fort Snelling, Minnesota, and who accompanied the front lines in the Pacific.

Evacuees returning to the West Coast have faced many difficulties and hardships in their attempt to regain a normal place in civilian life. Galen M. Fisher lists these obstacles as "public hostility, boycotts, housing shortage, job discrimination, official denial of business and professional licenses, extortionate insurance premiums, legal barriers, lack of funds, loss of ambition and enterprise due to age, frustration, and idleness in the Centers. . . . The most formidable obstacle to resettling has been the housing shortage" ("Resettling the Evacuees," *Far Eastern Survey,* Sept. 26, 1945).

Among the evacuees located in the Tule Lake Center there still remain some who may be eligible for relocation. Myer states: "WRA planned to relocate all evacuees who were eligible from Tule Lake, the segregation center at Newell, California, by February 1, 1946. At the same time Immigration and Naturalization Service officials were processing aliens who wished to return to Japan and Nisei who had renounced their United States citizenship according to the Congressional law of July 1944. Some renunciants had accepted transfer to Japan during 1945. Others still had cases pending in court at the end of the year, contending that renunciation was made under duress. The Department of Justice late in 1945 issued regulations permitting review of expatriates' dockets upon the individual request of the renunciants."

Since the beginning of the resettlement program, one of the major objectives has been the distribution of the Japanese more widely throughout the nation, since, in 1940, 88.5 per cent of all Japanese in the United States were living in the three Pacific Coast states. The WRA authorities believe that the condition of Japanese Americans will be improved if they are not concentrated in a few cities. In Myer's opinion: "The net result of the years and events between evacuation and the return of the evacuees to normal American communities probably has been an overall improvement in the status of America's Japanese. About half of those originally removed from the West Coast resettled in the Midwest and East, in communities which had previously had little knowledge of this particular minority. The wartime movement of these people to relocation centers and their later resettlement made the problem the nation's and not just that of the West Coast states.

"On the whole the future for second-generation Americans of Japanese ancestry appeared promising in the light of greater public understanding of them and their problems. Leaders among the Nisei are aware that there are still a number of obstacles to be overcome before Japanese Americans receive full American recognition. However, evacuation and the consequent program of relocation have speeded the assimilation of America's Japanese by helping to give them a new attitude toward their country, as well as creating new sympathy toward Issei and Nisei. Relocation, particularly away from the former West Coast 'Little Tokyos,' tended to break up the old-country cultural pattern of family solidarity, and obedience to the family head. Younger Japanese Americans in many instances pioneered to new communities ahead of Japanese-born parents, and in a number of cases have remained permanently in the East while the older members of the family returned to the Coast. It is probable that this independence has matured the average Nisei more rapidly than would have been expected under other conditions."

Fundamental aspects of the relocation program are examined in Alexander H. Leighton's recent account of the months of tension in the Poston Relocation Center (Arizona) the forces that brought about a general strike by the evacuees, and the leadership that quieted the storm. This study provides valuable documentary evidence of the psychological and sociological forces at work in the relocation centers (Alexander H. Leighton: *The Governing of Men*, Princeton University Press, 1945).

Successful resettlement of the evacuees may do much to allay the suspicion and fear felt by minority groups who have been aroused by the treatment of Japanese Americans in this country since Dec. 7, 1941. Although the Supreme Court ruled that the evacuation was constitutional, the decision was not unanimous. A forceful criticism of the ruling was expressed by Prof. Eugene V. Rostow of the Yale University law department: "As time passes, it becomes more and more plain that our wartime treatment of the Japanese and the Japanese-Americans on the West Coast was a tragic and dangerous mistake. That mistake is a threat to society, and to all men. Its motivation and its impact on our system of law deny every value of democracy. . . . The evidence supports one conclusion only: the dominant element in the development of our relocation policy was race prejudice, not a military estimate of a military problem. . . . [The Supreme Court] failed to uphold the most ordinary rights of citizenship, making Japanese-Americans into second-class citizens, who stand before the courts on a different legal footing from other Americans. It accepted and gave the prestige of its support to dangerous racial myths about a minority group, in arguments which can easily be applied to any other minority in our society" (Eugene V. Rostow: "Our Worst Wartime Mistake," *Harper's Magazine*, September, 1945).

THE NEGRO IN INDUSTRY

The Second World War brought better employment opportunities to Negroes in this country than ever before, according to *Racial Aspects of Reconversion*, a memorandum prepared for the President of the United States by the National Urban League, Aug. 27, 1945. This situation is attributed jointly to "(1) the demand for labor in essential industry; and (2) the operation of manpower controls, particularly anti-discrimination measures." Citing the Bureau of Labor Statistics, the report states that approximately 1,000,000 Negroes were added to the civilian labor force between April, 1940 and November, 1944, increasing the number of employed Negro men and women from 4,400,000 to 5,300,000. Furthermore, the League estimated that some 30 per cent of the Negro workers were in skilled and semi-skilled occupations. Before the war all but a small proportion of Negro wage earners were in unskilled and domestic services.

Much of the Negro's improved employment status, however, was found in temporary war industries. The National Urban League's memorandum to President Truman cited War Manpower Commission figures to indicate that 726,000 Negroes were employed in all industries engaged in the manufacture of materials of war. Of these, 182,000 were in shipbuilding, 142,000 in ordnance, 107,000 in aircraft, 60,000 in basic iron and steel, 22,000 in basic nonferrous metals, 19,000 in communications equipment, 16,000 in rubber, and 178,000 in other munitions. Naturally, these industries underwent the earliest and heaviest cutbacks with the end of the war. Hence, the Negro's place in industry after the period of reconversion is uncertain. The League's memorandum emphasized that the Negro will suffer disproportionately in unemployment unless the goal of full employment is realized and unless the wartime provisions for fair employment practice are continued.

THE NEGRO IN FEDERAL EMPLOYMENT

Negroes also made gains in Federal employment during the war, according to a report of the Committee on Fair Employment Practice. This report is based on the Committee's survey of 57 government agencies and departments with a total personnel of 2,295,614, or 85 per cent of all full-time government employees as of March 31, 1944. Negroes comprised 11.9 per cent of all employees in the 57 agencies and departments. They made up 19.2 per cent of the workers in departmental services (located chiefly in Washington) and 11.2 per cent of the employees in field service (*Survey Graphic*, April, 1945, p. 120).

In an article "Negro Employment in the Federal Government" (*Phylon*, 1945, No. 4, pp. 337-346), J. A. Davis and C. L. Golightly compare the FEPC figures for 1944 with figures from other sources for 1938. Thus, as compared with 11.9 per cent in 1944, Negroes constituted only 9.9 per cent of the total government employees listed in the 1938 *Annual Report* of the Civil Service Commission. The Negro's gain in occupational status has been even more impressive, especially in so far as increasing proportions of workers of clerical status are concerned. According to L. J. W. Hayes' study of 1938, about 90 per cent of the Negro Federal government workers in Washington in that year were classified as "custodial," 9.5 per cent as "clerical—administrative and fiscal," and 0.5 per cent as "subprofessional and professional." In contrast, according to the FEPC survey of 1944, only about 40 per cent of the Negroes in departmental service (located chiefly in Washington) were classified as "crafts protective and custodial," about 10 per cent as "clerical-mechanical," 49 per cent as "clerical—administrative and fiscal," and 1 per cent as "subprofessional and professional."

As in industry, however, the postwar position of the Negro in civil service may be considerably less favorable than that of 1944, since the largest numerical and occupational gains were made in the temporary wartime agencies and in "nonclassified" or temporary rather than in permanent appointments.

WARTIME SHIFTS OF NEGRO POPULATION

The National Urban League has estimated that some 750,000 Negro civilians were involved in interstate migration during the five years 1940-1944. Of these "more than 100,000 are estimated to have moved to southern industrial centers from other urban and rural communities in the South. Approximately 300,000 southern Negro workers moved to the border states and northern industrial communities. More than 100,000 went from the northern border states to other areas. The West Coast gained over 250,000 Negroes from the rural and urban South, the Mid-west and the East. Approximately 200,000 of this total were from the South" (National Urban League: *Racial Aspects of Reconversion,* April 27, 1945).

In regard to the permanence of this redistribution of Negro population, the same report states that the "proportion of Negroes who will remain in centers of in-migration will probably be significantly higher than the average for all in-migrants." Furthermore, "surveys reveal that a disproportionately large ratio of Negro veterans, 75 per cent of whom are from the South, do not desire to return to their former places of residence. The war has thus intensified the urbanization of the Negro and dispersed the population more broadly."

RACE RELATIONS

Among the events of 1945 that had an important bearing on race relations, the most outstanding were, of course, the end of the war and the first steps toward demobilization and reconversion. The fear of post-war economic insecurity among both whites and Negroes has tended to create more friction between the races. The problems are intensified by the congestion of Negroes in areas and cities where they have migrated in response to wartime labor demands, by increasing unemployment, an acute housing shortage throughout the country, and the demobilization of thousands of service men who are trying to establish themselves in normal civilian life. It is reported that these factors have already increased anti-Negro bias on the West Coast, where comparatively few colored people were living before the war.

The fall of 1945 was marked by racial conflicts between white and colored students in public schools of Gary, Chicago, and New York City. In Gary and Chicago, white pupils carried out strikes in protest against the presence of colored students and demanded that Negroes be placed in separate schools. In New York City, a personal fight between a Negro and a white youth in Franklin High School led to a series of racial clashes, but the disturbance was soon controlled. All these cases were symptomatic of the restlessness and insecurity prevalent among many young people during the trying period of war, and of underlying community fears and attitudes.

It has been estimated that at the close of the war nearly 1,000,000 Negroes were or had been in uniform. Although there were many instances of prejudice, discrimination, and open conflict between white and colored troops during the war years, on the whole the status of Negroes in the armed forces saw some improvement. Before the end of the war, there were instances of white and Negro men serving in the same combat units of the Navy, and Negroes were being admitted to a wider variety of occupations and skills in the Navy. White and colored troops were also reported serving together in some infantry divisions in Europe. The status of the Negro in the Navy and Army is, of course, only part of the larger problem of relations between whites and Negroes in the entire country. The return of these colored veterans to civilian life intensifies the need for better understanding and cooperation between the two races.

Efforts to bring about such cooperation are the principal objectives of numerous private and official agencies and organizations. One of the most important of these is the Southern Regional Council, which was established in February, 1944, as an outgrowth of the Commission on Interracial Cooperation and as the result of a series of conferences held during 1942 and 1943. The Council is composed of members of both races and has developed its program in the belief that "any sound movement for social progress must be based on the realization that the South can not go far without democratizing its social order and giving all of its human resources a chance to develop their potentialities. The Council's functions may be summarized as follows: (1) clearing-house and coordinating work with numerous agencies working on Southern problems; (2) research and survey to determine the facts and the state of public opinion as a basis for sound social action; (3) educational activities through a monthly paper, *The Southern Frontier,* and through pamphlets, press, radio, conferences, and personal contacts; (4) consultative services to private or official agencies; (5) constructive action at every possible point on the social, economic, political and racial problems of the South" (Southern Regional Council: *The Southern Regional Council; Its Origin and Purpose*).

Efforts are also being made to improve relations between native Americans and Spanish-speaking people in the United States. The Office of the Coordinator of Inter-American Affairs has had a Spanish-Speaking Peoples Section. This Section has recently been transferred to become a Division in the Institute of Ethnic Affairs, Inc. The Division has sought to stimulate and encourage local leadership, focus attention on the special problems of Spanish-speaking people in the United States, and cooperate with other agencies working with this group. For the most part, the program of the Division has taken the form of grants-in-aid to establish institutions of the states having large Spanish-speaking populations. In carrying out its program the Division has felt that development of mutual understanding and cooperation between this group and native Americans is of significance for the country's relations with other American nations (Jane W. Pijoan: *The Spanish Speaking People of the United States*).

COMMITTEE ON FAIR EMPLOYMENT PRACTICE

The status and the future of the Committee on Fair Employment Practice were still uncertain at the close of 1945. Although the idea of a permanent Fair Employment Practice Commission received strong support during the political campaign of 1944, both from the Presidential candidates and from numerous aspirants for political office, Congress failed to enact such legislation during 1945. However, the calendars of both House and Senate have contained bills on this subject. Soon after the convening of Congress in January, 1945, several bills were introduced in the House providing for a permanent Fair Employment Practice Commission and were referred to the Committee on Labor. In February, Representative Mary T. Norton, of New Jersey, on behalf of the majority of the Committee on Labor, reported H.R. 2232, a composite of the various bills that the Committee had considered. "The purpose of the bill is 'to prohibit discrimination in employment because of race, creed, color, national origin or ancestry.' The proposed law would apply to any employer having in his employ six or more persons, who is engaged in interstate commerce; or who is under contract to the Federal Government; a labor union having six or more members and officials; and all Government agencies" (*Congressional Digest,* June-July, 1945). Employers and unions are, however, free to adjust their policies and to manage their internal affairs as they please, so long as they do not discriminate against any individual on account of color, race, creed, or national origin. Unlike the present Committee, the proposed permanent commission would have power to subpoena witnesses and enforce its directives by recourse to usual court processes in cases where arbitration had failed. A similar bill, S. 101, was introduced in the Senate by Senator Chavez of New Mexico, and was referred to the Committee on Education and Labor.

The House bill, H.R. 2232, reported out of the Committee on Labor in February, but it is being held in the Rules Committee by a tie vote on the issue of reporting it for debate. Representative Norton has filed a petition asking that the Rules Committee be discharged from further consideration of the bill. However, a bill can be brought to the floor for consideration only after such a discharge petition has been signed by 218 members, and so far Representative Norton has not secured the required number of signatures. In the Senate, the comparable bill, S. 101, was given floor priority on Jan. 17, 1946, but to date has met the usual opposition and delaying tactics of certain senators from the South.

The present Fair Employment Practice Committee is merely a temporary war agency created by Presidential Executive Order. The fight against it was renewed in the Seventy-ninth Congress when the appropriations bill for the fiscal year, beginning July 1, 1945, was being considered. The War Agencies appropriation bill was passed by the House without provision for the present FEPC, although the Bureau of the Budget had recommended an appropriation of $559,000. In the Senate, after an attempted filibuster that locked up all action on the War Agencies appropriations for several weeks, a compromise was reached whereby $250,000 was appropriated for operation of the Committee during the present fiscal year. The Committee already has had to curtail its operations because of this restricted appropriation. Throughout its history, the FEPC has been handicapped by lack of funds and by lack of power to enforce its directives, yet "it has had notable success in maintaining democratic standards of employment, in educating backward employers and unions, and in bringing into war industry thousands of sorely needed workers who otherwise would have been barred by racial or religious prejudice. The problems of the post-war period seem certain to increase, not diminish, the importance of such an agency" (*Survey Midmonthly,* August, 1945, p. 209).

Although Congressional action on the FEPC has been indecisive, anti-discrimination laws were enacted in two states during the year, and bills providing for investigation of the problem were passed by two other state legislatures. On March 12, 1945, New York set up a five-man "State Commission against Discrimination," which is empowered to prevent employers from discharging or refusing to hire workers or discriminating against them in any way on account of race, creed, color, or national origin. The Commission also has the duty of preventing labor unions from excluding, expelling, or discriminating against an individual for these reasons. The New Jersey legislature, on April 16, 1945, established a "Division against Discrimination" within the state Department of Education, composed of the Commissioner of Education and a seven-man council. In Indiana, the state Department of Labor was empowered to make studies of discrimination and methods of eliminating it, to prepare reports, and to hold hearings and make recommendations in cases of discrimination. The Utah Legislature provided that a three-man legislative investigating committee be formed to study cases of discrimination and the need for anti-discrimination legislation.

LEGISLATION AND BILLS AFFECTING MINORITY GROUPS

During 1945, no bill of major importance affecting the welfare of minority groups was passed by either house of the Seventy-ninth Congress to become law, though numerous bills dealing with immigration, naturalization, and racial groups were introduced and a few were passed by the House. One bill of interest was H.R.

3517, introduced by Representative Celler of New York and passed by the House on October 10, 1945. This bill provides that persons of races indigenous to India shall be admitted under a quota system and shall be racially eligible for naturalization. Under the provisions of the bill, an annual quota of 100 is available for all would-be immigrants belonging to races indigenous to India, regardless of where those persons are now living or in what country they were born. This bill has not been passed by the Senate.

On April 17th the House passed H.R. 776, introduced by Representative McGehee of Mississippi, providing for the naturalization of Filipinos. During the year the House also passed a bill (H.R. 714, introduced by Representative Dickstein of New York) that simplifies the immigration procedure for wives of men and husbands of women serving in our armed forces. In the field of naturalization, H.R. 511 was passed on June 28 under the sponsorship of Representative Mason of Illinois. This bill amends the Nationality Act of 1940 so that educational requirements are waived for persons who are 50 years of age or over if they have made a declaration of intention and have been residents of the United States since before 1924. The bill also simplifies the naturalization of alien parents of men and women who have been or are in the armed forces of this country.

Congressional interest in immigration centered particularly upon post-war policies and problems. The House authorized the Committee on Immigration and Naturalization to study the basic problems affecting post-war policies in these fields. Hearings were held during the year in New York, Chicago, San Francisco, and Los Angeles, and the subcommittee responsible for the hearings recommended the creation of a more permanent committee of experts who shall give careful consideration to the whole problem of immigration and naturalization.

More immediate and one-sided action was called for in various bills that were introduced in the House but not passed. Representative Izac of California introduced a bill that would prohibit the entrance for the next 30 years of any person who is a national of any country with which the United States was at war during the Second World War. Other bills provide for the reduction of quotas for stated intervals of time or for the suspension of quota immigration entirely for a certain number of years after the end of the war. Numerous bills were introduced providing for the suspension of all immigration during years in which unemployment in the United States assumes serious proportions.

Once more the House approved the anti-poll tax bill, providing for the abolition of the poll tax as a prerequisite to voting for Federal elective officers, and once more the bill has been held up in a Senate committee. One gain may be recorded, however, for during the year the poll tax in Georgia was repealed by the state legislature. At present, therefore, only seven states retain this restriction on voting—Alabama, Arkansas, Mississippi, South Carolina, Tennessee, Texas, and Virginia.

In the field of official regulations, mention should be made of important changes in visa procedure. On July 1, 1945, sole responsibility for the issuance of immigration visas to the United States was restored to American consuls abroad. Thus, the Visa Division of the State Department has discontinued its wartime control of the issuance of visas. There is a new provision in the visa regulations: the applicant for a visa must now present a permit showing that he has the permission of his home government to leave the country.

AMERICAN INDIAN AFFAIRS

By D'Arcy McNickle
Office of Indian Affairs, Department of the Interior

LEGAL STATUS

The Indians of the United States and Alaska number 420,720 (387,970 in continental United States, 32,750 in Alaska), and represent an expanding racial group. While the term "tribe" is not used with any preciseness of meaning, nevertheless some 200 groups exist to whom the term "tribe" is applied. These groups own property in a tribal name or exercise rights and privileges under a tribal designation.

Indian tribes are to be recognized as the remnants of once sovereign states. This is a legal view first enunciated by Chief Justice Marshall, to which later justices of the Supreme Court, members of the Congress and administrative officials generally have adhered in greater or lesser degree. The doctrine holds that any state, in placing itself under the protection of a more powerful state or nation, does not thereby cease to exist except as its existence may be limited or defined by the greater power. Indian tribes, in other words, have whatever rights of self-determination they originally had, less whatever rights have been taken away from them by the sovereign authority of the United States. In the matter of regulating law and order within an Indian tribe, for example, the United States has vested in Federal courts original jurisdiction over ten major crimes. The tribe then retains jurisdiction over those law and order matters lying outside of the ten specified crimes. In a few instances, state courts have been given jurisdiction by act of Congress, but otherwise the judicial authority remains in the tribe.

Approximately 100 Indian tribes govern their affairs under written constitutions, and a lesser number of tribes have incorporated under a Federal charter. These instruments, constitution and charter, are in many instances similar to the charters and by-laws under which municipalities operate.

Indians are also citizens of the United States and there is no inconsistency between such citizenship and membership in a tribe. This view has been repeatedly stated in court decisions. Indians are free to enter into contracts involving personal services or involving property, if that property is not held under trusteeship by the United States. Where such trusteeship exists there is usually a requirement that the Secretary of the Interior, as the officially designated trustee, join with the Indian in contracts involving property of this class.

INDIAN RESOURCES

Indian resources in land and other property suffered drastic reductions over the years. A map has been issued by the Department of the Interior showing land cessions obtained from Indian tribes from the beginning of colonization and settlement. Over 95 per cent of the total land area of continental United States was bargained for through the device of treaties, agreements, and acts of Congress authorizing purchases. The period of land cessions came to a close within the first decade of the present century, although that did not mark the end of Indian land losses. The Allotment Law of 1887 established procedures by which tribal lands, reserved to Indians by treaty and agreement, might be divided into individual parcels and fee title issued to the individual Indian. Tribal lands in excess of the area needed to supply each Indian with an allotment were then declared to be surplus and were opened for homesteading. Through these devices, lands passed out of Indian ownership at a rate of approximately

2,000,000 acres per year from 1887 to 1934. In that period the Indian estate dwindled from 138,000,000 acres to roughly 50,000,000 acres.

The record of land losses was halted with the passage of the Indian Reorganization Act in 1934, which prohibited future allotments of tribal land and authorized the Secretary of the Interior to restore the so-called surplus lands where homesteads had not been taken up, and it also authorized him to purchase lands for landless Indians.

It is necessary to have this historical background in mind in any review of Indian resources of the present day. Indian tribes and individual Indians today possess approximately 56,000,000 acres, the value of which is estimated at $260,000,000. The greater part of this area is forest and grazing land. The timber on Indian lands is estimated at 35,000,000,000 feet and valued at $90,000,000. Irrigation projects have been constructed to serve 840,000 acres of this Indian land, the cost of which was about $67,000,000. Indians owned 361,000 head of beef cattle and 50,700 head of dairy cattle, the income from which amounted to $15,000,000 in 1944.

ECONOMIC ACTIVITIES

Indian activities in food production continued to increase during this last year of the war. In addition to the acreage devoted to livestock production, approximately 400,000 acres were planted to forage crops, of which the yield was 437,000 tons, with a value of $4,800,000. Cereal crops were grown on 340,000 acres, with a yield of 4,800,000 bushels and a market value of nearly $5,000,000. Gardens and other field crops yielded an additional $5,000,000 of income.

The financing of these agricultural activities provides an interesting chapter in the year's work. Credit for Indians is supplied largely out of a revolving fund authorized in the Act of 1934. Congress has appropriated approximately $4,500,000 for this credit fund, on the basis of which commitments have been made in the total amount of $7,631,712.48. Of this amount, $5,533,082.48 has been advanced, against which $2,532,798.23 has been repaid. The repayment record in connection with these loans has been exceptionally good. In 1941, 7.64 per cent of payments due was delinquent; in the following year this rate decreased to 4.95 per cent; in 1943 it decreased to 3.41 per cent, and in 1944 to 2.94 per cent.

SCHOOLS

There has been a steady decline in attendance in Indian Service schools through the war years. In 1942, these schools showed an enrollment of 25,839 pupils. The number dropped to 22,207 in 1943, to 21,828 in 1944, and increased slightly to 22,502 in 1945. This loss of enrollment is accounted for in part by the absence of families who left the reservation and went into war work. Some of the children probably were able to enter public schools in the areas where the parents worked. In many cases, however, the children stayed out of schools and probably will never return. A number of schools throughout the Indian Service were forced to close because of teacher shortage as well as curtailment of transportation as school buses went out of repair.

THE NAVAJO PROBLEM

The most serious educational problem occurs on the Navajo Reservation. Ordinarily, Indian children can be accommodated in public schools where there are no Federal school facilities. Actually, there are more Indian children in public schools than there are in Federal Indian schools. In the Navajo area of 16,000,000 acres, no public schools are available. There are approximately 20,000 children between the ages of 6 and 18, but school facilities exist for only about 60 per cent of the number. Here especially it is essential to provide bus transportation because of the great distances to be covered. With the break-down in transportation, the problem became acute. A large program of school construction, of road building and repair, and replacement of mechanical equipment is indicated.

HEALTH

The shortages and difficulties which affected the educational program were also apparent in the health work carried on by the Indian Service. This Service operates 70 hospitals and sanitoria, with a bed capacity of 4,064, and in addition it has contract arrangements with a number of state, county, and private hospitals. In the course of 1945, 750,000 out-patient treatments were provided by these hospitals and 40,000 patients received hospitalization. Since the Indian Service was not classified as a war agency, its health personnel was at the call of the war-connected agencies, and throughout the Service shortages hampered the program. In addition, equipment became obsolescent, and repairs and replacements were often impossible to obtain.

THE INDIAN WAR RECORD

The record of the Indians in the war is outstanding. A total of 24,521 Indians, exclusive of officers, was in the several armed forces. This number included several hundred Indian women serving in the women's reserves of the Army, Navy, and Marine Corps, and in the nursing services. Two Indians, Lieut. Ernest Childers, a Creek, and Lieut. Jack C. Montgomery, a Cherokee, were awarded the Congressional Medal of Honor. The record is not complete with respect to awards, but the latest information indicates that the Silver Star was awarded to 51 Indians, the Air Medal to 70, the Distinguished Flying Cross to 34, and the Bronze Star Medal to 50.

A Ute Indian, Pvt. Lee Roy Hamlin, was with the first American group to cross the Elbe River and make contact with the Russian Army on April 25, 1945. Another Indian of the same tribe, Pfc. Harvey Natchees, who won the Bronze Star Medal and the Purple Heart, is credited with having been the first American soldier to enter the center of Berlin. A Pima Indian, Pfc. Ira H. Hayes, was with the group of six men who raised the flag on the summit of Mount Suribachi on Iwo Jima.

LEGAL DECISIONS

Several legal decisions handed down during 1945 were noteworthy. Settlement was reached with the State of Wisconsin bringing to a close a 91-year controversy over the title to certain lands located within the boundaries of the Menominee Indian Reservation. The California Indians were awarded a net judgment of slightly over $5,000,000, as payment for lands taken from them in the 1850's. Action in this case had been prosecuted in the Congress and in the courts for more than 20 years. These and other Indian claims cases pointed up the importance of establishing an Indian Claims Commission. Legislation proposing such a Commission has several times been introduced in Congress and has been endorsed by the two major political parties in several conventions. At the end of the year a new bill, H.R. 4497, was reported out by the Indian Affairs Committee of the Lower House, and there was great concern in the Committee to secure the enactment of the measure.

Hearings with respect to the rights of certain Alaska natives to exclusive occupancy of lands and water areas were authorized by the Secretary of the Interior. Three villages, Hydaburg, Klawock, and Kake, asserted claims to some 3,329,000 acres of land and open water, claims which were extensively inquired into by Richard H. Hanna, former Chief Justice of the New Mexico Supreme Court. In his finding, Judge Hanna recognized that, as to certain land areas, these Indians had continued in exclusive use and occupancy of a total area amounting to 273,000 acres. However, with respect to the open waters surrounding these lands, he held that the Indians never did, and did not now, use and occupy these waters exclusively. Rather, the waters were used in common by all tribes within the near area. Accordingly, no exclusive rights in water areas were recognized. The findings of Judge Hanna were confirmed by the Secretary of the

Interior in an order dated July 27, 1945.

NEW INDIAN COMMISSIONER

The year 1945 saw a change in Indian commissioners, the first in 12 years. John Collier, who had entered office as the appointee of President Roosevelt in 1933, retired in March 1945. His administration completely reversed policies which had been in effect almost without change since 1887. This was the policy of individualizing Indian land and breaking up the tribal entity. The new Commissioner is William A. Brophy, of Albuquerque, N. M., who had been the Special Attorney for the New Mexico Pueblos from 1934 until he entered the Department of the Interior in 1944 to work on Puerto Rican matters.

DIVISION XV

SOCIAL PROBLEMS AND CONDITIONS

PUBLIC SOCIAL WORK AND WELFARE

By Howard L. Russell
Director, American Public Welfare Association

GENERAL

Public welfare programs in the United States, while they are as old as the nation itself, have only in the twentieth century emerged as a well defined pattern of provisions and services to people in need. Only within the last decade and since the enactment of the Federal Social Security Act in 1935 have social services, public assistance, and related forms of public aid become an integral part of Federal, state, and local government operations.

In many governmental jurisdictions, however, the organization of public welfare services retains a "patchwork" quality resulting from the gradual establishment of new service programs without relating them to already existing welfare agencies. Accordingly, 1945 witnessed activity at all levels of government in studying and effecting further integration of such services. General assistance, for example, which has been financially supported by state and local resources and categorical public assistance financed by Federal, state, and local funds are gradually being integrated into one administrative program of public assistance. A closer integration is also being sought between child welfare services and the public assistance program. Along with this trend toward integrated welfare services goes the development of a comprehensive service program to all physically and mentally handicapped adults and children.

The end of the war has stimulated the efforts of welfare administrators everywhere to streamline their administrative organization and strengthen the financial support of their programs to be prepared for the immediate problems of the reconversion period. Generally speaking, public welfare organizations are in a better position to meet an increased demand for services than ever before.

The pattern of Federal-state-local partnership in financing and administering public welfare has demonstrated its effectiveness over the past decade, and provides the basis for further sound developments. Such developments are looked for by simultaneous legislative action at all governmental levels.

FEDERAL WELFARE LEGISLATION

Little Federal welfare legislation was enacted during 1945, but Congress had under consideration many significant proposals for expansion of social security and welfare services. The well-known Wagner-Murray-Dingell Bill includes most of these proposals such as security benefits to veterans, federalization of unemployment compensation and employment services, a compulsory health insurance plan, Federal aid for hospital construction, expansion of child welfare services, extension of Old Age and Survivors Insurance, and important changes in the nationwide public assistance program. On this proposed bill centered the public discussion of new welfare proposals. It is expected that Congressional action on these proposals will involve consideration of the issues one by one with separate bills to be presented on each issue.

Proposals to amend the assistance title of the Federal Social Security Act are of prime importance to state and local governments, since they involve additional Federal financial support of the public assistance program and establish conditions that would materially improve administrative standards in this program. These proposals include Federal matching for general assistance, the elimination of Federal ceilings on categorical grants, variable grants to states, direct payment to doctors for medical care, the elimination of residence and settlement as a condition of eligibility, and a requirement that federally matched services be administered by a single agency at the state and local levels.

The proposal to extend the benefits of Old Age and Survivors Insurance to a larger proportion of the population would eventually have a significant effect in reducing the total costs of public assistance. In a similar manner improvements in the nationwide but state administered state unemployment compensation program would relieve the public assistance agencies of much of the burden of caring for persons in need because of temporary unemployment.

Widespread interest was also evidenced in 1945 in proposals to increase Federal support of children's services administered at the state and local levels. A specific objective of the Maternal and Child Welfare Bill of 1945 is to seek statewide coverage for services to children.

MOVE TO INTEGRATE FEDERAL WELFARE SERVICES

During 1945 the President asked Congress for an extension of his war powers with respect to reorganization of Federal agencies. These powers, somewhat restricted, have been granted to him, and it is expected that a reshuffling of Federal functions by executive order may provide some improved integration of welfare services provided by the Federal Government. At the same time, considerable interest has been expressed in a proposal to create a new Federal department with cabinet status for health, education, and welfare. This new department would include all those agencies now loosely held together under the Federal Security Agency, and would further include the Children's Bureau and some other miscellaneous welfare functions. This proposal contemplates four major divisions of health, education, social security, and public welfare. Its adoption would further encourage a desirable integration of welfare services in the Federal Government.

WELFARE LEGISLATION IN NEW YORK STATE

The year 1945 saw 46 state legislative bodies in session, and since 43 of these would not meet again in regular session before 1947, it might properly be considered that the 1945 crop of welfare laws represents the states' conception of legislative provisions needed for the immediate reconversion period.

Generally speaking, 1945 state legislation has tended to make welfare benefits and services more broadly available to all people and on a more adequate basis. While all states which had legislatures in session passed some new welfare bills, special mention can be made of those states which gave major consideration to their state welfare programs. New York, for example, provided legislative framework for a concentrated attack on the problems of juvenile delinquency, and enacted eight separate bills which gave effect to the recommendations of the Governor's interdepartmental committee on delinquency. This included the establishment of a State Youth Commission. This legislation provided for state leadership in the prevention of delinquency, new state facilities for the care of delinquents, and greater flexibility in the use of state institutions for the treatment of young offenders. New York also created in its Executive Department a new State Division of Veterans' Affairs and required that county veterans' service agencies be established. It strengthened its public assistance program, continued its temporary State Commission on Medical Care, and authorized the Special Committee on Social Welfare and Relief of the New York State Joint Legislative Committee on Interstate Cooperation (known as the Ostertag Committee) to continue its comprehensive study of the administration of social services in the state.

LEGISLATION IN OTHER STATES

The Sixty-fourth General Assembly of Illinois enacted more than 160 laws pertaining to social welfare. Many of these represented decided improvements in the statutes pertaining to child welfare, care of the sick, housing, public aid, public health, and the public school program.

Indiana, following extended controversy over its public welfare organization, rearranged its welfare structure and passed several legislative acts designed to strengthen the total program.

The important Constitutional Convention in Missouri considered more than 377 proposals for changes in the state constitution and many of these were related to the state's welfare services.

Other states which gave particular attention to social legislation in 1945 were Alabama, California, Maine, Maryland, Massachusetts, Minnesota, North Carolina, Pennsylvania, North and South Dakota, Tennessee, and Vermont.

BROADENING OF PUBLIC ASSISTANCE GRANTS

Many state legislatures during 1945 broadened eligibility requirements for public assistance and improved the adequacy of public assistance grants. This latter activity was a direct attempt to keep public assistance grants in line with rising costs of living. Significant changes in the state public assistance programs included a Wisconsin special category for totally disabled persons, cash grants for home relief in New York, removal of ceiling limitations on old age grants in North Dakota and Oregon, and an increase in monthly old age assistance maxima in South Dakota, North Carolina, Delaware, Michigan, Vermont, Utah, Washington, and Wyoming.

A number of states revised provisions which had restricted grants to dependent children under certain limiting conditions. Pennsylvania lessened its residence restrictions for public aid. Maryland and Vermont reduced residence requirements for assistance to the needy blind. Illinois, North Carolina, and Massachusetts revised restrictive measures which limited eligibility for public assistance grants.

Several states authorized important administrative changes in welfare programs. Typical of these were the reorganization of state and county welfare boards in Indiana, the consolidation of executive positions in Michigan's twin welfare departments, and the transfer in Wisconsin of its child welfare services to county welfare departments.

SPECIAL STUDIES AND SURVEYS

A number of states during 1945 initiated special studies or surveys of problems in relation to indigent and aged citizens. In Ohio the Chief of the Division of Aid to the Aged was directed by law to make a complete and thorough survey of the present needs of recipients of aid for the aged in relation to present costs of relief standards. Ohio also provided for the appointment of a Pension Program Commission to make a study of public pensions, including aid for the aged, to which the taxpayers of the state contributed in any way.

The Kansas Legislative Council was directed to make a study of the present state program and facilities for the care, treatment, and other disposition of delinquent, dependent, neglected or mentally defective children.

In Oregon a Joint Interim Committee was appointed for the purpose of investigating and studying the advisability of establishing institutions for the care, examination, specialized study and treatment of delinquent, under-privileged, and maladjusted children, and generally to investigate and study the prevention of child delinquency and the rehabilitation of delinquent children.

Missouri established a Children's Code Commission to survey existing state laws regarding children's services and to study unmet needs of children. Illinois also created a special commission to "prepare and develop a program designed to consolidate and coordinate the administration of child welfare functions of the state."

The Connecticut legislature enacted a law requiring the Public Welfare Council to "make a survey of the conditions leading to delinqency and neglect of children and the needs of delinquent, neglected, and uncared for children."

A new law in the State of Washington provided for appropriation by counties and methods for financing a program for juvenile care.

LOCAL PUBLIC WELFARE

Local welfare administrators have been increasingly concerned with the effect of reconversion unemployment on the relief rolls. No dramatic changes in relief rolls occurred during the year, but administrators were conscious of the fact that the downward trend, maintained since pre-Pearl Harbor, had reversed itself, and there was increasing evidence in the latter months of the year of heavy demands for public aid. A few local governments increased welfare appropriations in anticipation of larger relief rolls, but most were satisfied to wait until an emergency arose. Further increases in the cost of living combined with larger relief rolls obviously may present a difficult financial problem to the local public welfare agency.

The administrative agencies for public welfare continued during 1945 to feel the effect of the wartime shortage of trained personnel but this situation tended to improve toward the close of the year with the return of former employes from the armed services.

PUBLIC ASSISTANCE

In September 1945, 232,000 general assistance cases were being added throughout the country. This represented a decline of 8.7 per cent from a year previous, while expenditures declined only 1.7 per cent and represented an average monthly grant of $29.72.

Old Age Assistance, aiding 2,034,000 persons in September 1945, fell off 1.7 per cent from the previous year, but expenditures were 6 per cent higher, with an average monthly grant of $30.17.

Aid to the Blind was given to 70,753 recipients in September 1945, which was a decline of 2.5 per cent from the previous year, while expenditures increased 8.7 per cent, with an average grant of $32.38.

The Aid to Dependent Children program in September 1945 aided 258,000 families containing 657,000 children. This was an increase of 2.5 per cent over the previous year in number of families, while expenditures increased 14.3 per cent, with an average grant of $48.93 for each family.

The increased expenditures for all forms of public aid, as compared to the decline in the total number of persons assisted, evidences the nationwide effort to keep assistance grants in line with increased living costs.

The approximately 3,000,000 handicapped and indigent people on assistance rolls during 1945 received about $1,000,000,000 in aid from Federal, state, and local governments. About 15 per cent of these funds came from local sources as compared to 44 per cent from state and 41 per cent from Federal sources.

CHILD WELFARE

A central and important function of public welfare agencies is the provision of child welfare services. These are financed largely by state and local governments but also supported and stimulated by Federal grants authorized through the Social Security Act but administered by the Children's Bureau in the Department of Labor. Federal grants for children's services are provided on a discretionary basis rather than on a fixed formula of matching.

Current Federal proposals that funds for child welfare services be substantially increased are based on the desire to make such services available on a nationwide basis. Such a change, if adopted, would indicate a move in the direction of matching state and local expenditures rather than the allocation of such funds on a discretionary plan.

The functions of child welfare workers have been described by the Children's Bureau as including (1) the protection of children in their own homes through guidance and legislative action, (2) arranging care for children outside of their own homes where necessary, (3) finding and securing attention for children who are physically or mentally handicapped, (4) safeguarding children of illegitimate birth, (5) service to courts handling problems of child custody or juvenile delinquency, (6) assistance to child-caring institutions in problems of admission and aftercare services, (7) extending psychiatric or other casework services to children in connection with mental hygiene clinics, (8) assisting schools in handling attendance and conduct problems, and (9) organizing community activities for the prevention of juvenile delinquency.

The wartime interest in the overall problem of juvenile delinquency was not abated during 1945, and public welfare departments have played an increasingly important role in working with other community agencies in coping with this problem. Services to juvenile courts occupy a more and more important place in the program of the local public welfare agency.

CARE OF THE CHRONICALLY ILL

Welfare administrators have been concerned during 1945 with the special needs of the chronically ill. While chronic sickness spans all age groups, the custodial and institutional care needed by the chronically ill in the aged group continued to be a serious problem. Welfare workers are exploring the means of increasing such custodial and institutional care. They are encouraging a recognized trend to convert poorhouses into infirmaries, and to establish standards for the conduct of private nursing homes and homes for the aged. Additional consideration is being given to the effect of providing public assistance to inmates of public institutions as a means of increasing the facilities available to the permanently handicapped and chronically ill in need of special care.

CONCLUSION

The year 1945 was a year of planning needed changes in the content of public welfare programs and the perfection of their organization. Changes that have been made indicate a broadening concept of public welfare responsibilities and a tightening of organizational structure to discharge that responsibility. The unification of public welfare administrative machinery at all three levels of government, and a liberalizing of the Social Security Act to provide broad Federal participation and leadership in all forms of social assistance and service remain the immediate objectives of public welfare.

HOUSING

By Howard F. Vickery

Director of Information, National Housing Agency

GENERAL

At the end of hostilities, housing loomed as one of the most critical of United States reconversion problems. By the end of 1945, machinery had been set in motion to ease some of the emergency conditions and to establish a national housing policy and a long-range program to stimulate a larger volume of home building for all income groups. While none of these measures could remedy overnight a housing situation that had been long in the making, there were hopeful signs in the recognition by both the public and responsible officials that new and comprehensive steps were necessary and must be taken.

The year brought the completion of the war housing program, under which more than 4,000,000 migrating war workers had been housed for war production, and the building industry kept alive and started on reconversion.

War's end brought, too, a rapid discharge of veterans. As more and more veterans returned to civilian life to look for homes or double up, and as the immediate prospects for any large volume of new building declined, the serious nature and extent of the nation's housing shortage was more widely recognized. This shortage, which had been predicted by the National Housing Agency, was estimated as causing the doubling up of more than 3,000,000 families with others by the end of 1946.

The year could claim the introduction of far reaching housing legislation—S.1592, The General Housing Act of 1945, the most comprehensive housing legislation ever to be considered by the Congress. And with the close of the year Congress approved funds to move temporary war housing to provide additional homes for veterans. Also, as the year ended, a simplified system of priorities for building materials on new homes at prices of $10,000 and below with veterans preference, was to be restored to help combat inflation and make possible a larger volume of home building in the price ranges where the shortage was the most acute.

THE WAR HOUSING JOB

The National Housing Agency, established by Executive Order on Feb. 24, 1942, to consolidate Federal nonfarm housing functions, had the major responsibility for the war housing job which was brought to completion in 1945. Policies were centered in the Office of the Administrator, and operations carried out through three major constituent units: Federal Home Loan Bank Administration, Federal Housing Administration, and Federal Public Housing Authority.

With the conclusion of its war job, the NHA had carried out a program to provide the necessary shelter to meet the needs of some 4,000,000 migrating war workers and their families —an estimated 9,000,000 persons in all. About half of these workers were taken care of in existing structures, largely through "Share Your Home" campaigns. Housing for the others had to be built.

Private financing was called upon to build when it could meet wartime needs and where there was reasonable assurance that there would be continued demand for the housing postwar. Public financing was used to build the remainder. In all categories of war housing, private financing supplied more than 1,000,000 dwelling units with an approximate private investment of nearly $5,000,000,000, a major share of it covered by FHA mortgage insurance. Public financing supplied over 830,000 units at a cost of $2,600,000,000.

As the needs of migrating workers began to be met, the NHA, acting in concert with the War Production Board, laid plans as early as July 1944 to broaden the war housing program as rapidly as manpower and materials permitted. Provision was made for three categories of priority housing—H-1 housing for migrating war workers with a sales price ceiling of $6,000; H-2 housing to relieve general congestion with a ceiling of $8,000; and H-3 housing to relieve cases of individual hardship and to take care of returning veterans.

Thus a core of the building industry was kept active in meeting imperative needs and in preparation for the post-war job. On Oct. 15, 1945, WPB Order L-41, the war measure which restricted residential building to quotas established by NHA, was lifted, and priorities for materials and sales price ceilings were abolished.

As of Aug. 31, 1945, when the war housing program was ended, it stood as follows:

	Completed	Under Construction	To Be Started[1]
H-1: Housing for In-migrant War Workers:			
Privately financed	1,009,001	26,487	20,702
New permanent units	810,711	25,671	18,580
Converted units	198,290	816	2,122
Publicly financed	832,241	22,004	4,978
New permanent dwellings	192,093	2,754	1,102
Demountable family dwellings	81,116	81	0
Temporary family dwellings	261,902	15,927	947
Converted family dwellings	49,370	6	427
Dormitory units	168,367	1,493	890
Stop-gap	79,393	1,743	1,612
Total H-1—Private and Public	1,841,242	48,491	25,680
H-2: Housing to Relieve General Congestion:			
Privately financed dwellings	1,571	23,526	78,159
Publicly financed dwellings	0	44	4,395
Total H-2—Private and Public	1,571	23,570	82,554
H-3[2]: Housing to Relieve Individual Hardship (all private):			
New construction	12,900	41,800	16,746
Conversion units	28,077	8,452	0
Total H-3	40,977	50,252	16,746
Grand Total—All War Housing—H-1, H-2, H-3	1,883,790	122,323	124,980

[1] "To Be Started" is housing which was approved as of V-J Day; publicly financed housing in this category was terminated and privately financed quotas which had not been taken by builders were withdrawn. Publicly financed war housing under construction was terminated where it was in the public interest.

[2] Approximately 16,000 veterans who wished to build their own homes had H-3 priorities as of Aug. 31.

FEDERAL HOUSING ADMINISTRATION

Most of FHA's operations during the war period were conducted under Title VI which was added to the National Housing Act specifically to assist in providing housing for war workers, and a separate War Housing Insurance Fund was established. Insurance activity under this title ended in August 1945.

Mortgages insured under it were limited to a maximum of $5,400 on a single-family house; $7,500 on a two-family house; $9,500 on a three-family house; and $12,000 on a four-family house, and could cover up to 90 per cent of FHA valuation.

Also under this Title, FHA was authorized to insure mortgages on large-scale rental projects up to 90 per cent of the appraised valuation but not to exceed $5,000,000 for any one project.

Approximately 450,000 dwelling units for war workers were provided by mortgages insured under Title VI, for which the total insurance authorization was $1,800,000,000.

From the start of the national emergency in July 1940 up to the surrender of Japan, approximately 750,000 new privately financed dwelling units were started under all FHA Titles.

The long-term program of the FHA, carried out under Titles I and II, of the National Housing Act, has enabled more than 1,600,000 families to build, purchase, or refinance their homes, or to rent modern quarters. FHA insurance under Title II, which covers mortgages issued to finance the building or buying of a home, is now more than $5,133,000,000, and FHA repair loans under Title I, exceeding more than 5,000,000 in number, aggregate $1,903,733,000. As of Aug. 31, 1945, approximately $2,090,689,150 of the mortgage loans and more than $1,600,000,000 of the repair loans had been repaid through regular monthly payments or prepayments.

FEDERAL PUBLIC HOUSING AUTHORITY

The Federal Public Housing Authority, which has responsibility for Federally administered public housing programs, had toward the end of 1945, four principal activities: 1. The management of public war housing during the period of reconversion and demobilization for distressed families of veterans and servicemen, for civilian employees of the War and Navy Departments and of private industries completing war contracts, and for distressed families dislocated or displaced as a result of the war or demobilization; 2. Disposal of Federally owned housing determined to be surplus to the above needs; 3. Extension of Federal aids to low rent housing built before the war, and the conversion of war housing under the U. S. Housing Act to low rent status; and 4. Extension of Federal aid on low rent projects deferred by the war, as building labor and materials become available.

Before the outbreak of war interrupted construction of low rent housing under the United States Housing Act, local housing authorities in 173 communities built 334 projects containing 105,600 units for low income families formerly living in slum dwellings. The program thus far has been predominantly urban, but a small number of farm housing units were constructed under a rural program started shortly before the war.

The total development cost of the pre-war low rent projects was $483,000,000. Although the FPHA is authorized to lend up to 90 per cent of the development costs, it has actually supplied only two-thirds of the long-term financing, as a result of the ability of local housing authorities to sell bonds on the private market at an interest saving. All loans for the FPHA or private investors are being repaid in full, with interest, in accordance with established amortization plans.

To help keep rents within the means of low income families, the FPHA makes an annual contribution, or subsidy, which for 1944 totaled $8,600,000, or $7.19 per dwelling unit per month. To June 30, 1945, Federal subsidy payments totaled $43,409,000; this represents the entire cost to the Federal Government since the beginning of the low rent program. In addition, the local community is required to make an annual contribution equivalent to at least one-fifth of the Federal contribution. This is normally done by exempting the projects from state and local taxes, as authorized by the U. S. Housing Act and state housing laws.

When the war began, only half of the program authorized under the United States Housing Act had been completed. Units under construction at that time were completed with the aid of priorities to house war workers, and are being turned back to the use of low income families as conditions permit. Additional war housing projects were built under Public Law 671, which authorized the use of low rent housing funds for war housing construction. Altogether low rent units scheduled in areas not requiring more war housing were deferred, pending availability of building labor and materials. As of Aug. 31, 1945, the total housing built or authorized under the United States Housing Act comprised 193,566 dwellings in 749 projects.

The major wartime function of FPHA was to provide publicly financed housing for in-migrant war workers and their families; the FPHA being responsible for the construction and management of about four-fifths of the total provided. The remainder was provided by other agencies, principally the War and Navy Departments and the U. S. Maritime Commission. For the total public war housing program, some $2,600,000,000 was made available, all from Congressional appropriations or loan authorizations except $29,000,000 expended by the New York State Division of Housing.

From these funds some 864,000 accommodations were scheduled for families or single persons, and all but 32,000 units had been completed by Aug. 31, 1945. The war housing completed includes 585,000 family dwelling units, 168,000 dormitory units, and 79,000 trailers, portable shelters, and other forms of stop-gap housing. These figures include accommodations made available by re-use of trailers and temporary or demountable units which were moved from one location to another.

Not counting units that may be transferred to the FPHA by the NHA or the Surplus Property Administration, the FPHA has some 656,000 units, completed or under construction contract, to dispose of.

FEDERAL HOME LOAN BANK ADMINISTRATION

The third constituent unit of the National Housing Agency, the Federal Home Loan Bank Administration, continued its important credit and financing operations begun in 1932. The Federal Home Loan Bank Administration directs the operations of the Federal Home Loan Bank System and the Federal Savings and Loan Insurance Corporation, two permanent agencies established to encourage home ownership and economical home financing, and to protect savings. Also under the supervision of the Administration is the Home Owners' Loan Corporation, an emergency agency founded to aid distressed homeowners and stabilize investments in residential real estate during the depression.

FEDERAL HOME LOAN BANK SYSTEM

Authorized in 1932, the System provides a credit reserve for thrift and home-financing institutions. Following the national pattern set up for commercial banks in the earlier inauguration of the Federal Reserve System, 12 regional Federal Home Loan Banks were organized, each to serve member home-financing institutions in its area by making both short and long-term advances to meet their needs. Through the regional banks funds may be shifted from areas of abundant credit to areas of scarcity. Since their establishment, they have advanced $1,497,966,000 to their member institutions, of which $112,450,000 were outstanding on Aug. 31, 1945.

Member institutions of the System totaled 3,699. Of these 3,659 were savings and loan associations, cooperative banks and homestead associations, Federal Savings and Loan Associations, for whom membership is mandatory; 25 mutual savings banks and 15 insurance companies were also members of the System. Assets of member institutions amounted to $8,087,000,000. The System is self-supporting.

FEDERAL SAVINGS AND LOAN INSURANCE CORPORATION

In 1934 Congress provided an insurance program for investors in savings and loan associations and similar home financing institutions by creating the Federal Savings and Loan Insurance Corporation. Federal Savings and Loan Associations were required to be insured; insurance is optional for state chartered associations. The public confidence, inspired by the fact that savings are so safeguarded, has provided a steady flow of funds into insured institutions. About 4,300,000 investors in 2,475 savings and loan associations, with combined assets of approximately $5,700,000,000, are now protected by insurance up to $5,000 each. The Federal Savings and Loan Insurance Corporation has been self-supporting.

HOME OWNERS' LOAN CORPORATION

Over a period of three years following its creation in 1933, the Home Owners' Loan Corporation refinanced delinquent mortgages on more than 1,000,000 homes, providing low-interest, long-term loans which gave the owners a new chance to rehabilitate themselves. In these rescue operations, approximately $3,093,000,000 were loaned to homeowners, an amount increased to $3,490,000,000 by later advances to borrowers and other disbursements by the Corporation.

Almost 74 per cent of this investment has been liquidated through collections on the Corporation's loans and the sale of properties securing its mortgages which it was obliged to take over by foreclosure. Since 1936 the primary functions of the HOLC have been its collections and the general liquidation of its assets, as well as aiding its borrowers to meet their payments and retain their homes. Although the agency was forced to acquire a total of 198,127 houses by foreclosure, all but 663 had been sold by Aug. 31, 1945.

On that date HOLC was collecting on 515,684 accounts—391,732 those of original borrowers and the rest purchasers of acquired properties. A total of 488,109 borrowers and purchasers of HOLC houses had paid off their accounts in full. More than 84,000 borrowers were making monthly payments in amounts greater than called for by their contracts.

Notwithstanding the fact that HOLC made loans to homeowners badly in arrears on their old mortgages, and high losses were originally anticipated, the operations during the 12 months ended Sept. 30, resulted in a net income of more than $20,000,000. This reduced the net deficit to $86,000,000 which is less than 2½ per cent of the Corporation's total investment in loans and properties.

Liquidation of HOLC accounts to that date represents an acceleration of about 13 per cent over amortization schedules. Unless something wholly unexpected develops to interfere with present progress, there is little doubt that liquidation will be completed within the time set by law, without loss to the Government.

POST-WAR NEEDS AND PROGRAMS

With the end of the war, the National Housing Agency and its constituent units, immediately directed its efforts to stimulating the largest possible volume of home construction and to combating inflationary price trends resulting from the acute shortage of housing throughout the country.

The housing job ahead was recognized as being unprecedented in the nation's history. Almost every city and town had a shortage of housing growing out of two conditions—lack of sufficient construction to meet increasing needs in pre-war years, and the fact that, during the war, home construction had to be limited to shelter for migrating war workers so that materials and manpower could be directed to the production of weapons and equipment for our armed forces.

Some 1,200,000 families were already doubled up by Oct. 1, 1945, and an estimated 3,400,000 additional families were expected to need accommodations by Dec. 31, 1946. Approximately, 2,900,000 of these were established as being veterans seeking to reestablish themselves with their families in normal civilian life.

To meet this need less than 1,000,000 dwellings were anticipated through present and future vacancies, and the most optimistic forecasts of dwellings that may become available through new construction and conversion were 475,000 units. The prospect was for a housing deficit of 2,000,000 accommodations by the end of 1946, over and above the current deficit of 1,200,000 units.

The NHA, through its regional offices, is aiding communities to organize to meet as much of this housing need as possible, particularly that of veterans. Veterans' families are being given occupancy preference for vacancies in all Federally owned housing, builders are urged to give veterans preference in the sale of new houses, and communities are being urged to establish adequate housing services to assure veterans preference in future vacancies in the existing housing supply.

From the long-range point of view, the NHA estimated that the country needs 12,500,000 new dwellings in the next 10 years. Construction at this scale would mean an investment of $6,000,000,000 to $7,000,000,000 annually and would provide more than 4,000,000 jobs, off and on the building site. To achieve these ends, and to move toward a goal of a decent home for every American family, proposals are pending in Congress to provide for: new aids to private enterprise to encourage the production of housing for rent and sale in the "middle market"; aids to communities to clear slums and blighted areas and prepare the land for redevelopment at economically sound costs; continued Federal aid to communities to provide low rent, public housing for families of very low incomes; a broad program of technical and economic research aimed at aiding the building industry to reduce costs; and aid to communities in analyzing their own housing problems and in mapping out plans to meet the needs of all income groups.

PRISONS AND CRIME CONTROL

By James V. Bennett

Director, Bureau of Prisons, Department of Justice

CORRECTIONAL PROGRAMS OF THE ARMY AND NAVY

The most impressive development during 1945 in correctional work in terms of size as well as program, was the rapid expansion of both the Army and Navy. As of Nov. 1, 1945, the Army had a total of 34,766 prisoners and the Navy, 16,070 prisoners. In general, both Army and Navy Corrections Divisions followed the lead of well established philosophy of individualized diagnosis and treatment, and construction and administration of institutions. In spite of inadequate facilities, inexperienced personnel, and a very rapid rate of commitment, the Army and Navy programs soon showed rapid progress. From December 1942 through Nov. 1, 1945, a total of 16,915 Army general prisoners were honorably restored to military duty.

After the cessation of hostilities, the War Department formulated a procedure which provided for the re-examination of the sentences of all general prisoners through the operation of special clemency boards. The chairman of the special board that determined its broad policies with respect to the proper sentences for Army cases was first U. S. Circuit Judge Sherman Minton, former Senator from Indiana, and later Associate Justice Owen Roberts recently retired from the Supreme Court of the United States. These gentlemen, in consultation with high-ranking Army officers, reviewed typical cases of convicted soldiers and recommended to the Secretary of War such revisions in the more or less hastily imposed sentences of Army courts-martial as seemed to them appropriate. These decisions, when and as approved by the Secretary of War, established the benchmarks which will be used by reviewing boards in determining the need for clemency in particular cases.

The Navy's correctional program

has gone through a similar rapid growth. The number of general courts-martial prisoners had increased 8,000 during the fiscal year to a total of 14,524, and by Nov. 1, 1945 had increased to 16,070 prisoners. Paralleling the Army procedures, the Secretary of the Navy established the Naval Clemency and Prison Inspection Board headed by Vice Admiral J. K. Taussig. A review of all cases committed for purely military offenses is being made each six months.

TRENDS IN PRISON POPULATION

For many years, population rates in the prisons and reformatories of the United States showed a continuous increase. Beginning with 1940, however, and continuing during the war years, this population began a steady decline. At the end of 1940, the total prison and reformatory population was slightly more than 180,000. By the end of 1943, this figure had been reduced to 139,588, and a further decrease to 127,000 was reported on Dec. 31, 1944. Although no estimates of the prison population for 1945 have been made available, there is some evidence that the low point has been reached.

The probabilities are that no further declines in population will be seen and that the post-war years may witness an equally striking rise in the population of our prisons and reformatories. All the elements which make for an increase in crime seem to be on the immediate horizon—displaced war-workers, new standards of money values, influence and example of war profiteers, the large number of juvenile delinquents, and many other problems of reconversion.

NEW YORK STATE LEGISLATION

Toward the end of hostilities, there was a noticeable shift in emphasis in the correctional field from war to post-war planning. In every section of the country, states began to appoint committees and draw up blueprints of a modernized correctional system. In addition to new legislation covering sentencing procedures, centralization of control, selection of personnel, new building programs are under consideration in Pennsylvania, Maryland, Wisconsin, California, Alabama, Louisiana, and in other states. To assist these states and to obtain an overall view of the needs and plans for the post-war years, a Committee on Post-War Planning, under the chairmanship of Austin H. MacCormick, was created by the American Prison Association and has been very active during the past two years.

In state prison systems, the year 1945 was filled with plans for post-war expansion and improvement in both institutional facilities and programs. A few states began actual operations under new and forward looking legislation.

New York led the states in 1945 in new correctional legislation, enacting a comprehensive and progressive program for improvement in both the field of correctional administration and control of juvenile delinquency. One statute, known as the Youth Act, authorized the establishment of local youth bureaus, recreation and education projects, and general guidance for the development, protection, and security of children. The act also created a temporary State Commission to assist local agencies in preventing juvenile delinquency and to reimburse half the cost of any local community program which the Commission approves.

Another New York statute provides that no child subject to the laws of the Childrens' Court may be detained or committed to any jail, penitentiary, or lock-up or in any place where he may come in contact with previous offenders. Recent legislation also provides for a Reception Center at the Elmira Reformatory where all male offenders between the ages of 16 and 21 will be committed by the courts for diagnosis and designation to the proper institution.

A marked advance in parole was made by the passage of a law unifying the nine separate parole systems in the state under a State Board of Paroles within the Department of Corrections.

LEGISLATION IN OTHER STATES

The Wisconsin legislature took active steps to improve the treatment of offenders in that state by authorizing a $600,000 diagnostic center at Madison. The center, when constructed, will supply complete information concerning offenders committed by the courts. The center is to be operated jointly by the state Department of Public Welfare and the Medical School of the University of Wisconsin.

Maryland approved legislation to provide indeterminate sentences for offenders between the ages of 16 to 25 years. The Women's Prison and the State Penal Farm will be converted into reformatories for the incarceration of these youthful offenders. A second law revised the Juvenile Court statute, setting up a probation system and abolishing the jurisdiction of the obsolete Magistrate's Court in juvenile cases and vesting it in the circuit courts. The age limit of juveniles is raised to 18 years, and jurisdiction extends to dependent, delinquent, neglected and feeble-minded children.

This by no means exhausts the list of states active in the improvement of their correctional programs. California, Virginia, Pennsylvania, and Georgia are instances of states which are now building on foundations of legislation previously laid.

THE JUVENILE OFFENDER

The importance of finding some better method of readjusting the prisoner has been brought to the attention of the public most strikingly by the American Law Institute. This organization of lawyers and judges focused attention upon the youthful offender by showing statistically and through case studies that most of the adult criminality has its inception in conviction of crime before the age of 21. While young people under the age of 21 form only 13 per cent of the population, they constitute 40 per cent of the apprehended burglars and 50 per cent of the automobile thieves. Nearly 60 per cent of those who have a prison record again commit crime. This organization has been urging the establishment of a Youth Justice Authority in each state to assume responsibility for all youthful offenders. A model act was adopted at the annual meeting of the Law Institute in June 1940, which, if adopted, will write into the state laws for the first time the notion that reliance upon our present methods of prison and reformatory treatment is unsound and will establish in each state an authority with the sole responsibility for a preventive and corrective program for young persons centralized in a qualified commission having full power to utilize all the scientific and modern methods of analysis and treatment.

So far, the only state to enact legislation along these forward-looking lines has been California, although other states have had similar legislation under consideration. The legislation passed in 1944 creates an Adult Authority which, like the Youth Authority established previously, has the power to fix sentences, grant paroles, and transfer prisoners in accordance with sound principles of individual classification.

The whole youth problem is highlighted by statistics showing that the age of persons arrested and imprisoned increased sharply in the past few years. Statistics published by the Federal Bureau of Investigation reveal that in the first six months of 1945, 21.4 per cent of all persons arrested were under 21 years of age as compared to 19.2 per cent in the first six months of the previous year. Arrests of juvenile girls for crimes against property increased 9.2 per cent and arrests for boys for crimes against persons increased 23.8 per cent. In the Federal prison system the percentage of commitments under 20 years of age rose from 8.5 per cent in 1941 to 15.2 per cent in 1945.

PROBATION AND PAROLE

The year 1945 seems to have been an active year for consideration and passage of legislation in the correctional field. Although much of the legislation proposed dealt with the youthful offender, a good deal of it was devoted to probation and parole.

While much of the proposed legislation failed to pass the respective state legislatures, the nature of the proposals themselves is significant.

In Colorado, for example, bills were introduced to allow the judge to place persons on probation without the concurrence of the prosecuting attorney and to create a state probation and parole system. The National Probation Association prepared the draft of these bills on request of the State Bar Association but they failed to pass. In Connecticut, bills to establish statewide administration of adult probation and a youth correction authority were pending in the state legislature.

The Florida legislature failed to pass a bill establishing a juvenile court in each county not having a separate court of exclusive and original jurisdiction over dependent and delinquent children under 17. The bill also provided for the appointment of a state director of juvenile probation. In Michigan, some progress was achieved when the prohibition against using probation for persons having been twice convicted on a felony was eliminated.

A bill to establish a state board of adult probation and parole and to authorize the use of probation, parole, and suspended sentence was passed by the House in the Montana legislature but killed in the Senate. In Nevada, the powers and duties of the State Board of Pardon and Parole Commissioners were enlarged, giving them the power to appoint one or more parole officers.

Among the legislation passed in New York in the correctional field, one bill gave the State Board of Parole the power to issue a certificate of good conduct to any person previously convicted in the state of a crime who thereafter conducts himself in a manner warranting such a grant and if such conduct has continued for a period of not less than five consecutive years. Persons who hold such certificates or who have been pardoned may have business or professional licenses restored to them. These laws affect the right to receive an alcoholic beverage license, to practice medicine, to be licensed as a private detective, and to exercise the voting franchise.

Increasing attention also is being given to the need for considering the crime problem as a national responsibility. There is a growing feeling that solid improvement in the prevention and control of crime can not be made unless local law enforcement agencies, court policies, and correctional standards are brought more nearly to the same plane. It seems to many people that the crime problem is not being attacked in any fundamental way, for New York or Wisconsin or California to improve the condition of its prisons, rigidly enforce its laws, or provide enlightened care for wayward youth if their borders still remain open to embittered and unreformed convicts or to the maladjusted citizens of other states which make no attempt to provide equal services.

DIVISION XVI

LABOR AND LABOR LEGISLATION

LABOR CONDITIONS AND LEGISLATION

By H. M. DOUTY*

BUREAU OF LABOR STATISTICS, DEPARTMENT OF LABOR

GENERAL

Substantial progress had been made by the end of 1945 in the transition to a peacetime economy. However, the production effort for war had been so great and had exercised such a decisive influence on all sectors of the economy that readjustment problems of great magnitude were inevitable.

With the collapse of Japanese resistance in August, military requirements for goods and services were sharply curtailed. Contracts aggregating billions of dollars were terminated immediately after VJ-Day, yet Federal expenditures for military purposes continued at a relatively high level for the remainder of the year, with some tapering off as demobilization proceeded.

Peak wartime employment in manufacturing was reached in 1943 and has declined continuously since that time. Production worker employment in manufacturing stood at 13,100,000 in January 1945, and declined to 11,900,000 in July and to slightly less than 10,000,000 in October. There was a fractional upturn in November. The sharp drop between July and October largely reflected cutbacks in war materials requirements. Total civilian employment in October 1945 was estimated at 51,500,000 and total unemployment at 1,600,000. The volume of unemployment by the end of the year was considerably below prior estimates. The full force of demobilization had yet to be felt, however. A major problem clearly involved the reallocation of the labor force to meet the requirements of an enlarged civilian economy.

Government control of wage and salary increases was modified on Aug. 18, 1945. All control was removed with respect to those increases that could be made within the existing price structure. Union demands for substantial wage rate increases became widespread, and led in many instances to major industrial disputes involving basic wage-price policy. These disputes were largely unresolved as the year ended.

The no-strike-no-lockout pledge was not reaffirmed after the end of the war. The complete liquidation of the National War Labor Board as an agency for the adjudication of labor disputes was scheduled for the end of the year. The President convened a labor-management conference in November to devise effective procedures to minimize work stoppages. Shortly after the close of this conference, which was only partially successful, the President proposed legislation to permit the naming of panels to make findings of fact and recommendations in disputes of national scope which threatened to develop into stoppages. Pending the enactment of legislation, fact-finding panels were appointed to investigate disputes in several industries.

Neither of the major labor federations held a convention during 1945. The CIO participated in the formation of a World Federation of Trade Unions. There was great interest in proposed legislation to make full employment a matter of national policy. Amendments to the Fair Labor Standards Act, designed to increase the statutory minimum wage level, were the subject of extensive hearings before Congressional committees. Efforts to liberalize unemployment compensation during the reconversion period failed. Hearings on proposed legislation for health and disability insurance were scheduled for the spring of 1946.

THE LABOR FORCE

As estimated by the Bureau of the Census, the total labor force, including members of the armed forces, contained 67,500,000 persons in July 1945 and 63,800,000 in October. This reduction was caused largely by the withdrawals of school-age workers, and, with the end of the war, of persons not regularly in the labor force. Unemployment increased from approximately 1,000,000 in July to 1,700,000 in September, but declined slightly to 1,600,000 in October as the return of workers separated from war industries to civilian production gained speed.

The civilian labor force in October 1945 numbered 53,100,000 persons. A comparable figure for October 1944 can not be given at this time.[1] It is difficult to estimate the changes in the size of the civilian labor force that may be anticipated in the near future. Its size will be affected by decisions on the post-war strength of the armed forces and on the net effect of demobilization and withdrawals from the labor force.

In 1945, the labor force contained more than 7,000,000 "extra" workers; that is, persons who normally would not have sought gainful employment. These extra workers included young persons who ordinarily would have been in school or college, persons past the retirement age, and marginal workers. Many of these extra workers have already left the labor market, following the end of the war. It is unlikely that all will leave, however, and the impact of the war on the size and composition of the labor force will be felt for years to come.

NON-AGRICULTURAL EMPLOYMENT

Non-agricultural employment in November 1945, as estimated by the Bureau of Labor Statistics, was lower than the level in November 1944 by about 2,700,000 employees (Table 1). Proprietors, self-employed persons, and domestic servants are excluded from the estimates, which are not comparable with the non-agricultural employment figures shown by the Bureau of the Census in its labor force estimates.

The decline in non-agricultural employment during this period resulted largely from a sharp drop in manufacturing employment, and from smaller declines in government service and in mining. Employment in the other major industry divisions increased over the year.

Employment in manufacturing reached its wartime peak in 1943 and, with slight interruptions, has declined continuously since that time. Production worker employment stood at 13,400,000 workers in November 1944, 11,900,000 in July 1945, and a preliminary estimate of 10,000,000 in November 1945. Preliminary data indicate a slight upturn in production worker employment in manufacturing between October and November 1945.

FARM EMPLOYMENT

During the war the demands of the armed services and the opportunity for non-farm jobs accelerated the downward trend of farm employment. The number of farm family workers and hired workers combined was 11,100,000 in October 1945, 7 per cent below the level in October 1944. Part

[1] Preliminary.

[2] Estimates include all full- and part-time wage and salary workers in non-agricultural establishments who were employed during the pay period ending nearest the 15th of the month. Proprietors, self-employed persons, domestic servants, and personnel of the armed forces are excluded.

of the 14 per cent decline in the number of hired workers is attributable to unusually heavy rains in the fall of the year, which impeded harvesting in many parts of the country.

Decreases in agricultural employment occurred in all regions of the United States except New England, where there was a slight increase. The greatest percentage decline was among hired farm workers who form about one-fourth of the total number of workers. While farm employment continued to decline in almost every month of 1945 as compared with corresponding months of 1944, the volume of agricultural production for 1945 was almost as large as the record production attained the previous year.

WEEKLY HOURS

Weekly hours in manufacturing industry as a whole averaged 45.6 in December 1944, the highest average recorded for any month during the war period. For the entire year of 1944, hours worked averaged 45.2 per week. There was a gradual decline in average hours worked in manufacturing during the first seven months of 1945, the average in July being 44 hours. With the end of the war, shorter work-schedules were instituted in many plants, and weekly hours averaged 41.6 in October.

Throughout the war, average weekly hours were higher in the durable than in the non-durable goods industries. In January 1945, for example, weekly hours averaged 45.4 in all manufacturing, 46.8 in durable goods, and 43.4 in non-durable goods. With the end of the war, average hours in durable goods fell more sharply than in non-durable, with the result that by October there was no material difference in the level of hours in these two broad divisions of manufacturing industry. Table 2 summarizes the changes in hours in manufacturing.

The end of the war produced, in general, slight reductions in the level of average weekly hours in those non-manufacturing industries for which data are available. There was a sharp drop in average hours in the Federal service, however, as the standard work week was reduced from 48 to 40 hours.

War Manpower Commission 48-hour directives were rescinded with the end of the war. At least in manufacturing, a general return to a standard 40-hour week may be anticipated. It is likely, however, that an appreci-

TABLE 2

AVERAGE WEEKLY HOURS IN MANUFACTURING

1944–1945

Year and Month	All Manufacturing	Durable Goods	Non-durable Goods
1944 (average for year)	45.2	46.6	43.1
1945			
January	45.4	46.8	43.4
July	44.0	44.9	42.8
October[1]	41.6	41.8	41.5

Source: U. S. Bureau of Labor Statistics.

able amount of overtime will be worked in many manufacturing industries until current shortages of goods have been eliminated.

EARNINGS IN 1945

Average weekly earnings of production workers in all manufacturing reached a wartime high of $47.50 in January 1945. In the durable goods group of industries, which includes ordnance, aircraft, and shipbuilding, weekly earnings averaged $53.54 during this same month. Workers in the non-durable goods industries averaged $38.66 in January 1945 (Table 3). By July 1945, the level of weekly earnings in all manufacturing had declined by about $2, owing almost entirely to a decline in the durable goods division.

With the end of the war, average weekly earnings fell abruptly in durable goods, the decline amounting by October to more than $6 in comparison with July and to more than $9 in comparison with January. The decline in the level of weekly earnings in nondurable goods was relatively small. The reduction in average weekly earnings in manufacturing as a whole (about $6.50 between January and October) was owing primarily to reductions in hours and to a declining proportion of workers in the relatively high-wage industries.

Basic wage rates did not decline during the year. In fact, the level of straight-time average hourly earnings in manufacturing advanced by about 2 cents between January and October, after correction for the influence on the level of earnings of shifts in the distribution of workers among industries. The semi-annual index of urban wage rates in manufacturing, prepared by the Bureau of Labor Statistics, increased by 1.6 per cent between October 1944 and April 1945 and by 1 per cent between April 1945 and October 1945. It appeared likely at the year's end that wage rate increases would be secured in large segments of manufacturing industry during 1946.

As pointed out in the previous section, there were only slight reductions in the level of hours after the war in those non-manufacturing industries reporting hours and earnings to the Bureau of Labor Statistics. Average weekly earnings appeared, on the whole, to be somewhat higher in these industries in October 1945 than in October 1944, with the average in the former month ranging from $24.12 in the general merchandise division of retail trade to $64.80 in brokerage establishments. Gains in wage rates during the year were greater in non-manufacturing than in manufacturing, on the basis of data compiled by the Bureau of Labor Statistics on wage rate changes in selected non-manufacturing industries. Earlier wartime increases, however, had been larger in manufacturing than in most of the non-manufacturing industries.

TABLE 3

EARNINGS AND HOURS IN MANUFACTURING, 1944-1945

Year and Month	All Manufacturing			Durable Goods			Nondurable Goods		
	Average Weekly Earnings	Average Hourly Earnings	Average Weekly Hours	Average Weekly Earnings	Average Hourly Earnings	Average Weekly Hours	Average Weekly Earnings	Average Hourly Earnings	Average Weekly Hours
1944 (average for year)	$46.08	$1.019	45.2	$52.07	$1.117	46.6	$37.12	$0.861	43.1
1945:									
January	47.50	1.046	45.4	53.54	1.144	46.8	38.66	.891	43.4

Source: Bureau of Labor Statistics.

[1] Preliminary.

FARM WAGE RATES

Farm wage rates in 1945 reached record levels. The average rate in October 1945 was 182 per cent higher than the October average for 1935-39. The average rate rose 9 per cent between October 1944 and October 1945. Farm wage rates prior to the war, however, had risen considerably less than wages in most other fields of employment. The average farm wage rate for the years 1935 to 1939 was only 18 per cent higher than the average for 1910 to 1914. During the same period, the hourly earnings of factory workers increased almost 200 per cent, and their weekly earnings rose more than 100 per cent although weekly hours declined sharply.

Estimates made by the Bureau of Agricultural Economics of quarterly farm rates in the United States by four types of payment indicate that the increases in rates between October 1944 and October 1945 were slightly higher for those paid by the month than by the day. During this period the average rate per day without board rose approximately 8 per cent, from $4.08 to $4.39, and the average rate per day with board increased 7 per cent, from $3.72 to $3.98. The increase in the average rate per month without board was from $86.80 to $95.70, and with board from $76.40 to $84.00, or a rise for both types of about 10 per cent.

There was a wide state range, from $2.30 in South Carolina to $8.80 in Washington, in October 1945, in the average farm rate per day without board. These figures reflect differences in types of work and degrees of skill as well as regional variations in wage scales. Where roughly comparable types of work are considered, the range of difference is appreciably less. For example, the average wage rates for picking 100 pounds of seed cotton on Nov. 1, 1945 ranged from $1.70 in Alabama and Georgia to $2.30 in Arizona and North Carolina. Other factors affecting state differences include sex and age of workers, available supplies of workers and, currently, the degree of public control of farm wage rates.

The ending of the war saw a general relaxation of wage controls in industry, but larger segments of agricultural wages were subjected to regulation during 1945 than during any previous period since controls were authorized in 1942. The new controls in agriculture were largely those which set specific maximum rates for particular groups and areas. For example, maximum wage ceilings established in September and October following the end of the war may be illustrated by those for picking, pulling, and snapping cotton in 21 Arkansas counties; for harvesting apples in Yakima County, Washington; for topping and loading sugar beets in seven Idaho counties; for harvesting potatoes in Baker County, Oregon; and for dry-pack harvesting of lettuce in Maricopa County, Arizona.

MODIFICATION OF WAGE AND SALARY CONTROL

Between Oct. 2, 1942 and the end of hostilities, all changes in wages or salaries in private industry other than agriculture were subject to control by the National War Labor Board, the Salary Stabilization Unit of the Treasury Department, or the National Railway Labor Panel. Wage or salary increases were approved only on the basis of well-defined criteria. Despite the existence of a necessary measure of flexibility in the control program, substantial stability in the basic wage rate structure of American industry was achieved.

Executive Order No. 9599, issued Aug. 18, 1945, resulted in decisive modification of the system of control. This order provided, in substance, that wage or salary increases that would not provide the basis for increases in price ceilings, or would not increase the cost of goods or services to government procurement agencies, could be made without approval. Thus, employers and workers immediately after the war were free to arrive at any upward wage adjustment within the existing price structure.

Approval by the appropriate stabilization agency was still required, however, for wage or salary increases that would provide the basis for price increases or increased cost to the Government. Executive Order No. 9651 (Oct. 30, 1945) and Regulations of the Office of Stabilization Administrator (Dec. 6, 1945) set forth in some detail the grounds on which wage increases would be approved in price relief cases. These grounds were: (1) increases required to compensate in terms of straight-time average hourly earnings for the increase in the cost of living between January 1941 and September 1945; (2) increases necessary to correct inequities in wage rates or salaries among plants in the same industry or locality; (3) increases in industries in which wage rates or salaries are inadequate to the recruitment of needed manpower for reconversion. Moreover, after a reasonable period, normally not less than six months, even unapproved wage increases can be taken into account for price purposes.

The nature of the new wage policy was explained by President Truman in a radio address on Oct. 30, 1945. The President emphasized the importance of maintaining control over prices during the reconversion period, but stressed also the desirability of wage rate increases within the framework of the existing price structure.

In his message to Congress on Sept. 6, the President had pointed to the significance for price and wage policy of the lower unit costs anticipated after reconversion on the basis of full post-war production and rising productivity.

GUARANTEED ANNUAL WAGES

The Advisory Board of the Office of War Mobilization and Reconversion (OWMR) was directed by President Roosevelt in March 1945 to survey "the whole question of guaranteed wage plans and the possibility of their future development in American industries as an aid in the stabilization of employment and the regularization of production."

The President's request was an outgrowth of one of the union's demands in the steel wage case that came before the National War Labor Board in November 1944. The union proposed that the steel companies guarantee weekly wages during the contract period to the workers then employed. In its decision, the Board recommended to the President that, in view of the lack of adequate information on the subject, a thorough study be made by some governmental agency.

As part of this overall study, the Bureau of Labor Statistics of the U. S. Department of Labor is conducting a survey of specific establishments that have experimented with guaranteed wage plans for all or part of their non-executive employees. The main object of this study is to find out how effective these plans have been, what methods have been used to make them work, and what conditions within and outside the industry have contributed to success or failure.

CHANGES IN CONSUMERS' GOODS PRICES

The consumers' price index compiled by the Bureau of Labor Statistics measures average changes in the retail price of goods, rents, and services used by moderate income families in large cities. In October 1945, this index, formerly called the cost of living index, stood at 128.9 (1935-39=100). This was 2.4 points, or 1.9 per cent, higher than in October 1944, and 27.9 per cent higher than in January 1941, the base date of the "Little Steel" wage formula.

The report of the President's Committee on the Cost of Living called attention to the fact that the index fails to reflect fully the effect of such wartime factors as lowered quality, disappearance of low-priced goods, forced changes in housing, and eating away from home. The Committee estimated, as of September 1944, that the index for the average of large cities would be increased by three to four index points if these and other increases were fully reflected. If small cities were included in the national average, an additional one-half point should be added. If account is also taken of continued deterioration in quality and disappearance of low-priced merchandise between 1944 and

1945, it seems probable that an overall adjustment of five points should be added for the period January 1941 to September 1945.

In line with the above considerations and with the concurrence of the Bureau of Labor Statistics, the Office of Economic Stabilization issued a statement for wage stabilization purposes on Dec. 6, 1945, to the effect that the official figure for the increase in cost of living from January 1941 to September 1945 would be 33 per cent.

Price increases of consumers' goods during 1945, although moderate, were general in character. Gas and electricity were the exceptions, the combined items showing a decrease of 0.8 per cent between October 1944 and October 1945. All other items showed increases ranging from 1.4 to 4.5 per cent.

The indexes for various groups of commodities in October 1945 were as follows (1935-39=100):

All items	128.9
Food	139.3
Clothing	148.3
Rent (September 1945)	108.3
Fuel, electricity and ice	110.6
Gas and electricity	95.0
Other fuels and ice	125.7
Housefurnishings	146.6
Miscellaneous	124.5

INDUSTRIAL INJURIES

The industrial injury frequency rate, which is the average number of disabling injuries for each million employee-hours worked, averaged 17.4 in manufacturing for the first three quarters of 1945. This is substantially below the average of 18.4 for the year 1944. The rate for the third quarter of 1945 was 18, considerably above the rate of 17.3 for the first, and 16.9 for the second quarter, and probably reflects the beginning of the changeover from war to civilian production and the resulting shifts in the labor force. Certain of the war industries, such as explosives and some types of ordnance manufacture, had particularly low injury-frequency rates. It was almost inevitable that some workers in these branches of industry should find peacetime employment in industries with higher injury rates.

As had been true in the past, certain of the apparel industries had the lowest frequency rate, while the highest rates were found in the lumber-working industries.

LABOR TURNOVER

The end of the war with Japan produced an immediate and very large increase in the labor turnover rate; by way of contrast, the turnover rate had been little affected by the end of the war in Europe. It should be noted that the voluntary quit rate was not immediately affected by the end of the war with Japan, the main effect being on lay-offs and hires.

Separations per 100 employees in all manufacturing industries combined increased from 7.7 in July to 17.9 in August, primarily because of an increase in lay-off rate of from 1.5 to 10.7 employees per 100. The slight increase in the quit rate was scarcely more than seasonal, which would seem to indicate that the large volume of voluntary separations that were expected after VJ-Day either did not materialize or were concealed in the immediate reductions in force which took place. Total separations per 100 employees dropped to 12 in September and to 8.7 in October, while the accession rate rose from 5.9 in August to 7.4 in September, and 8.6 in October, which was the highest rate since October 1942.

As might be expected, the major increase in separations occurred in the manufacture of all types of ordnance, with separation rates of 48.4, 29.9, and 26.2 in August, September, and October, respectively, and explosives with rates of 39.2, 44.6, and 21.4 for the same three months. The separation rate for transportation equipment, which includes the manufacture of aircraft and ships, was 38.4 in August, 29.9 in September, and 19.1 in October.

In all groups, women were separated at a faster rate than men, while men were hired in greater numbers than women. In August 1945, the separation rate per 100 workers was 24.8 for women, 14.6 for men; in September, 15.8 for women, 11.1 for men. By October, with the levelling off of the separation rate, the rate for women was 9.8 as compared with 8.1 for men.

WORK STOPPAGES IN 1945

Any picture of strikes and lockouts in the year 1945 should be viewed in two parts: (1) the war period with numerous spontaneous and unauthorized stoppages, most of them small and of short duration, and (2) the post-war months with several large, comparatively long and stubborn strikes together with numerous small ones. Although the total number of work stoppages in 1945 was smaller than in 1944, the number of workers involved and the amount of resulting idleness were greater in 1945 than in any year since 1919.

As this statement is written complete figures for 1945 are not available. Estimates by the Bureau of Labor Statistics for the first 11 months, however, show 4.560 work stoppages, 3,180,000 workers involved, and 26,980,000 man-days idle. Corresponding figures for 1944 were 4,692 stoppages, 2,024,000 workers involved, and 8,334,000 man-days idle. About 30 per cent of the work stoppages during this 11-month period took place in September, October, and November. These stoppages included 45 per cent of the total workers involved, however, and accounted for 65 per cent of the total idleness. Idleness during work stoppages in the first 11 months of 1945 was estimated at 0.35 per cent of the available working time—0.16 per cent in the first eight months and 0.98 per cent in the September-October-November period. In the year 1944 it was 0.09 per cent; in 1943 it was 0.15 per cent; the average for the years 1935 to 1939 was 0.27 per cent with 0.43 per cent for 1937, the highest for any year for which this type of information is available.

In the first eight months of 1945, as in the preceding war years, most of the work stoppages were small and of short duration. Labor's no-strike pledge was in effect and few if any strikes were authorized by the unions. After the termination of hostilities in August, however, strikes were more difficult to settle and were consequently of longer duration on the average. Whereas many of the stoppages during the war resulted from minor disputes, misunderstandings, and adjustments, many of those after VJ-Day involved basic economic factors, such as the relation between wages, prices, and profits. Loss of overtime work, shorter hours, and downgrading resulted in substantial reductions in take-home pay of many workers whose living standards were already adversely affected by wartime shortages of goods and high prices. These factors are largely responsible for the increased intensity and duration of work stoppages since VJ-Day.

Wages continued to be the most important issue in labor-management disputes during 1945. Among the more important stoppages over wage issues were: (1) 75,000 bituminous coal miners in April in connection with the renewal of the industry-wide agreement, (2) over 60,000 anthracite miners in May, (3) 40.000 textile workers in New York, New Jersey, and Pennsylvania in late September, (4) about 35,000 oil industry workers in September, demanding 52 hours pay for 40 hours work, (5) 30,000 lumber workers in the Pacific Northwest during the last three months of the year, demanding a minimum of $1.10 per hour, and (6) about 200,000 General Motors Corporation employees beginning their strike in November for a 30 per cent wage increase.

The question of union recognition for foremen and supervisory workers was the issue in a stoppage involving over 200,000 bituminous coal mine workers in September and October. Strikes of foremen, involving substantial numbers of workers, occurred also in the rubber industry.

Rivalry between AFL and CIO unions threatened to interfere drastically with reconversion plans in the automobile industry when approximately 40,000 Detroit workers were idle in June because of a dispute as to which unions should have jurisdiction over reconversion construction work and installation of new machinery. This stoppage was settled when AFL and CIO representatives agreed to the establishment of a local joint committee to adjust the difficulty and the establishment of a national committee to which unsettled points could be referred—the same procedure to be followed for any similar disputes in other localities.

LABOR-MANAGEMENT CONFERENCE

Shortly after the end of the war, President Truman issued a call for a labor-management conference. The conference call was motivated largely by the desire to find a substitute for wartime machinery for the settlement of industrial disputes.

The conference met in Washington from Nov. 5 through Nov. 30. Unlike its predecessor—the Industrial Conference convened by President Wilson in 1919 to deal with a similar set of problems after the First World War—the labor-management conference attained at least half of the objectives set for it by the President. Hope for further areas of agreement was seen in the unanimous decision to establish a standing committee made up of the heads of participating labor and industry groups that would continue its efforts to arrive at "friendly understandings in the public interest."

The conference was composed of 39 members, 18 representing the employers, 18 representing labor, and three the general public. The management representatives were selected in equal numbers from the United States Chamber of Commerce and the National Association of Manufacturers. The 18 labor representatives were chosen as follows: eight by the American Federation of Labor, eight by the Congress of Industrial Organizations, one by the United Mine Workers, and one by the Railway Brotherhoods. The three public, non-voting representatives were: Secretary of Labor Schwellenbach; Secretary of Commerce Wallace; and Walter P. Stacy, Chief Justice of the Supreme Court of North Carolina, chairman of the conference. Dr. George W. Taylor, former chairman of the National War Labor Board, acted as conference secretary. In an address at the opening of the conference, President Truman set its goal as the formulation of "a broad and permanent foundation for industrial peace and progress."

The conference debated the problems on the agenda in full session and in the following six sub-committees: (1) conciliation services, (2) initial collective agreements, (3) existing collective agreements, (4) collective bargaining, (5) management's right to manage, and (6) representative and jurisdictional questions.

The conference reached unanimous agreement on the reports of the first three named committees, which in substance provided that (a) the United States Conciliation Service should be strengthened so that it may be more widely utilized for the peaceful settlement of disputes; (b) "negotiation for new contracts should use every means at hand, including mediation and voluntary arbitration, before strikes are permitted"; (c) disputes involving interpretation of provisions of collective bargaining contracts should be settled through voluntary arbitration. There was also unanimous agreement to the effect that "no discrimination in employment due to race, color, creed, or sex" shall become the accepted policy of American industry.

No agreement was reached on collective bargaining, management's right to manage, and jurisdictional disputes. The committees that dealt with these problems submitted separate labor and industry reports. Among the specific questions at issue were industry proposals calling for government control of unions to insure labor and industry "equality before the law," and for "appropriate guarantees to insure complete and effective compliance with provisions prohibiting strikes, lockouts, or boycotts."

Both groups also failed to agree on a clear definition of management's prerogatives. Labor members took the position that there can not be sharply defined areas designated as management's prerogatives and labor's prerogatives "without either side constantly attempting to invade forbidden territory, thus creating much unnecessary strife." Labor's spokesmen also argued that "the responsibilities of one of the parties today may well become the responsibilities of both parties tomorrow." Industry members replied that "the labor members are convinced that the field of collective bargaining will in all probability continue to expand into the field of management." The industry view was that "the only possible end of such a philosophy would be joint management of enterprise. To this the management members can not naturally agree. Management has functions that must not and can not be compromised in the public interest."

That the conference did not fulfill the expectations of the President, especially its failure to recommend a plan for averting work stoppages when collective bargaining and mediation failed, is evident from the fact that three days after its adjournment he asked Congress to enact a bill to permit the establishment of fact-finding boards in national disputes, with no work stoppages during the period of the work of the boards and for five days thereafter. Commenting on the Conference, the President said in his message to Congress: "The very fact that the top leaders of labor and management have met and worked together for more than three weeks is itself some progress." He also characterized as "valuable" the agreements reached, but he expressed his disappointment that the conference "was unable to attain the objectives most necessary to successful reconversion."

DEVELOPMENTS IN ORGANIZED LABOR

According to the most recent estimates, there was an increase in total union membership from 13,750,000 in 1944 to 14,600,000 in 1945. Dues-paying membership undoubtedly declined during the latter part of 1945, however, as war production was sharply curtailed. Both the United Automobile Workers (CIO) and the International Association of Machinists (AFL) experienced heavy losses in aircraft. Unions in the shipbuilding and metal trades industries generally were affected by war production cutbacks and production delays incident to reconversion.

Both of the major labor organizations—American Federation of Labor and Congress of Industrial Organizations—were compelled to abandon their annual conventions in 1945, because of wartime restrictions on travel. The executive boards of both bodies decided to extend the tenure of their national officers until the 1946 regular conventions.

Other significant developments in CIO were: (1) the chartering of two new Internationals—Utility Workers' Union of America, which is a combination of the former Utility Workers' Organizing Committee, Brotherhood of Consolidated Edison Workers, and other former affiliates of the Independent Utility Workers Union—and the United Paper Workers of America; (2) amalgamation of the Federation of Architects, Engineers, Chemists, and Technicians (8,000 members) with the United Office and Professional Workers (51,000); (3) amalgamation of the United Federal Workers (30,000) with the State, County and Municipal Workers (45,000); (4) affiliation of the International Air Line Mechanics Association, an independent union, with the United Automobile Workers; (5) participation in the formation of the World Federation of Trade Unions, described below.

Among the major developments in the AFL were: (1) suspension of its largest affiliate—the International Association of Machinists (750,000)—for non-payment of dues as a result of jurisdictional disputes with other AFL affiliates; (2) chartering of two new Internationals—the Office Employees' International Union, and the International Chemical Workers' Union, and (3) reaffiliation of the International Typographical Union.

There was no convincing evidence during 1945 that the division between the AFL and CIO would be bridged in the near future. The United Mine

Workers remained independent, despite recurrent reports of imminent affiliation with the AFL.

FORMATION OF WORLD FEDERATION OF TRADE UNIONS

A new international labor center—the World Federation of Trade Unions (WFTU)—was launched at the Second World Trade Union Conference held in Paris from Sept. 25 through Oct. 8 by delegates from 65 national labor federations with an estimated membership of about 66,000,000 workers in 56 countries. The Congress of Industrial Organizations played a prominent role in the formation of the new body. The American Federation of Labor, however, refused to participate in its organization. The WFTU, in effect, supplants the 44-year old International Federation of Trade Unions (IFTU) with which the AFL was affiliated. The constitution of the IFTU provided for the affiliation of only one national labor federation from each country; representation was denied the Soviet unions on the ground that they were not independent of the Soviet Government.

The origin of the WFTU is at least two-fold. The Anglo-Soviet Trade Union Committee, formed soon after Hitler's attack on Russia, proposed that a world trade union conference be held. This proposal received the approval in 1943 of the British Trade Union Congress. There was parallel action at various conventions of the CIO beginning in 1941. Arrangements were finally made for the conference to meet in London in February 1945.

Of the four American trade union bodies invited—Congress of Industrial Organizations, American Federation of Labor, Railroad Brotherhoods, and United Mine Workers—only the first named accepted the invitation to the London Conference. The CIO, in announcing its acceptance through President Murray, stressed its lack of representation in the international trade union movement, and indicated that the CIO delegation would press for a new permanent world labor body, unless the IFTU would revise its constitution so that it might become a member. The refusal of the AFL to take part in the conference was owing mainly, as stated by President Green, to the inclusion of the Russian unions, "which are not free trade unions in the American sense of that term," and to the issue of an invitation to the CIO which the AFL considers a dual or rival organization.

The main objective of the First World Trade Union Conference was to lay the basis for the new world labor federation while the chief business of the second conference was to effect its organization. As constituted, the WFTU will operate through the following organizational structure: (1) World Trade Union Congress—a biennial meeting of delegates from affiliated national labor federations—is the highest governing body of the WFTU; (2) the General Council, consisting of at least one representative designated by each affiliate, meeting at least once a year, is charged with carrying out the decisions of the Congress; (3) the Executive Committee, composed of 26 members elected by the Congress, will direct the affairs of the WFTU between meetings of the General Council; and (4) the Executive Bureau of nine members, made up of a president, seven vice-presidents, chosen by the Executive Committee from among its members, and the general secretary of the WFTU. The general secretary, and three assistant general secretaries, appointed by the Executive Committee, are the chief administrative officers of the WFTU.

The major objective of the WFTU, as stated in the preamble to its constitution, is "to improve the living and working conditions of the people of all lands." This is to be accomplished through the following designated functions of the new world federation: (1) to organize and unite the trade unions of the world; (2) to carry on the struggle against all manifestations of fascism; (3) to combat war and the causes of war and to work for a stable and enduring peace; (4) to represent the interests of world labor in all international agencies concerned with world organization and world peace; and (5) to coordinate the struggle of organized workers of all countries for the improvement of their standards of living and for social security and to resist all efforts to encroach on their economic and social rights and on their democratic liberties.

In view of the fact that the constitution of the WFTU makes no mention of the International Federation of Trade Unions, and the further fact that both major officers of the IFTU, President Citrine and General Secretary Walter Schevenels, have become officers of the WFTU—the former is President of the Executive Bureau and the latter is a special assistant to General Secretary Saillant—it is generally presumed that the IFTU has in effect ceased to exist.

INTERNATIONAL LABOR ORGANIZATION

At its 1945 conference in Paris, the International Labor Organization adopted an instrument for the amending of its Constitution in such a way as to permit it to be brought into relationship with the United Nations Organization, and to stand by itself—if necessary—during the period in which the ILO will be neither a part of the old League of Nations, nor yet a specialized organization of the UNO (presumably operating under the latter's Economic and Social Council). The conference also readmitted Italy and Guatemala to membership, and accepted Iceland's application to join.

Immediately following the Paris Conference, the Organization held a preparatory Maritime Conference in Copenhagen, where a tripartite group of experts exchanged views on the elaboration, during 1946, of a convention or conventions on working conditions in the maritime occupations. An interesting development in the ILO is the creation of a series of international tripartite industrial committees to consider the human problems of basic industries. Two of these committees held their first sessions in 1945, one on inland transport and another on coal.

PENDING LEGISLATION OF NATIONAL SIGNIFICANCE

Practically all of the legislation of importance to labor introduced in the 79th Congress was still pending at the end of the year.

The "Full Employment Bill," introduced as part of the President's "must" legislation, contained in its earlier Senate versions a declaration of government responsibility for maintaining full employment, defined as opportunity for all those willing and able to work to find jobs; preparation of a "national budget" indicating total expenditures necessary by government, business, and consumers in order to maintain full employment; and periodic reports to a Congressional joint committee established for the purpose, with recommendations for measures to combat deflation or inflation. The House passed a substitute bill calling for promotion of high employment, production, and purchasing power, and both Senate and House versions were sent to conference committee.

Minimum Wage.—Hearings were held on legislation to set 65 cents as the minimum wage under the Fair Labor Standards Act, and a committee report is expected in January 1946.

Fact-Finding Boards.—In December the President submitted a message to Congress requesting the passage of legislation to permit the establishment of fact-finding boards in labor disputes of a national character. Disputes seriously affecting the public interest would be referred by the President to a fact-finding board within five days after certification by the Secretary of Labor. The board would have authority to subpoena persons and records and would make findings of fact and recommendations for the settlement of the dispute within 20 days, except as extensions of time were agreed to by the parties and approved by the President. Strikes would be prohibited for a period of 30 days, including the 20-day hearing period and five days thereafter.

Ball-Burton-Hatch Bill. — Other proposed legislation in the labor relations field included notably the Ball-Burton-Hatch Bill, which would transfer the United States Conciliation Service to a Federal Industrial Relations Board; would reconstitute the National Labor Relations Board as an unfair labor practices tribunal; and would provide compulsory arbitration in disputes seriously affecting the public interest. Later modifications, in the form of an amendment to the President's fact-finding legislation, would leave the organization and functions of the NLRB unchanged and remove the compulsory aspect of arbitration. Another bill, introduced by Senator McMahon and others, would enlarge the present conciliation services of the Government and make mediation, conciliation, and arbitration services more easily available to the parties to a dispute.

Strikes.—Numerous bills were submitted to repeal the War Labor Disputes Act which was intended to eliminate wartime strikes but which, in effect appeared to give them legislative sanction. Consideration of legislation to create a permanent Fair Employment Practices Committee was held up in the House Rules Committee, with a discharge petition being circulated. The Senate FEPC bill was reported out of committee and is pending on the calendar. The Hobbs "anti-racketeering" bill was passed by the House and sent to the Senate. It provides that interference with trade and commerce by robbery and extortion shall be a felony. Debate on the bill centered about its application to labor organizations.

Social Security.—In the area of social security and public services, several important measures were submitted. Efforts to liberalize unemployment compensation during the reconversion period met strong opposition, and the House Ways and Means Committee voted not to report the bill. Similar opposition was encountered in attempts to retain during reconversion the wartime Federal administration of public employment offices. The President vetoed an appropriations bill (H. R. 4407) which contained a rider returning the employment offices to the states within 100 days after enactment.

Health.—On Nov. 19 the President submitted a message requesting a health program that would include hospital construction, medical research, expansion of maternal and child health programs, and inclusion of health insurance and disability insurance in the social security system. The health features of the early Wagner-Murray-Dingell social security bill (S. 1050, H. R. 3293) were reintroduced (S. 1606), with the exception of hospital construction, for which a separate bill was passed by the Senate and sent to the House. Hearings on the health bill were scheduled for March 1946. S. 1050 would have extended almost universal coverage under the social security system. Extended hearings on housing legislation were still going on as an emergency "housing expediter" was appointed by the President in December to deal with this pressing problem. An appropriation measure, including $191,000,000 for temporary housing for veterans, was sent to the President.

STATE LABOR LEGISLATION

Forty-four states met in regular legislative session during 1945. The following brief summary of state labor legislation enacted during 1945 was prepared by the Division of Labor Standards of the Department of Labor.

Workmen's Compensation. — Thirty-seven states enacted legislation affecting workmen's compensation laws. Notable progress was made in establishing second injury funds to aid in the employment of handicapped workers and injured war veterans. With the addition of 13 new laws enacted this year, 32 states now have second injury funds. Four states for the first time provided protection against occupational diseases; 32 states now provide compensation for industrial diseases. Nineteen states raised the level of benefit payments. Six states increased the amount or duration of medical aid. Some gains were made in extending coverage of the laws.

Industrial Relations.—Connecticut passed the first Little Wagner Act since 1941, and Puerto Rico and Hawaii adopted comprehensive industrial relations laws. A "right-to-work" law and proposed constitutional amendments were passed in South Dakota, bringing to three the number of states prohibiting closed shop agreements. Rhode Island expanded the seniority rights of veterans. New York and New Jersey were the first two states to approve laws designed to eliminate discriminatory employment practices with regard to race, creed, color, national origin or ancestry. The laws specify a number of prohibited practices of employers, employment agencies, and labor organizations.

Wages and Hours.—Rhode Island became the third state to extend minimum wage coverage to men by amending its minimum wage law for women and minors. Hawaii amended its Wage and Hour Act to increase the minimum hourly wage rate from 30 to 40 cents and extended coverage to include agricultural workers and several other groups of workers. Nevada amended its minimum wage law for women to increase the daily minimum from $3 to $4, and the weekly minimum from $18 to $24. Massachusetts enacted a law prohibiting wage differentials based on sex for work of comparable character. Eight laws limiting the period in which workers may begin suits for recovery of wages were enacted; these statutes affect both state and Federal wage claim laws.

Child Labor.—Appreciable gains in child labor legislation appeared for the first time during the war years. Illinois passed a complete new child labor law which included a 16-year minimum during school hours and 14 outside school hours in factories and other specified establishments. Other gains included raising of the minimum age in general employment from 14 to 15 and prohibiting employment under 18 in certain hazardous occupations in Maine, limiting hours of work of students under 17 outside of school hours in New York, prohibition of night work for minors 16 and 17 years of age in Rhode Island, strengthening the law relating to agricultural work in Hawaii, and extension of workmen's compensation to illegally employed minors in Iowa and Minnesota.

Apprenticeship.—Six states and Hawaii strengthened their apprenticeship laws.

Safety and Health.—Two states authorized their State Labor Department to make and enforce safety regulations. Eight states strengthened provisions of their coal mining laws.

New Jersey enacted a measure of importance to migratory laborers. A Division of Migrant Labor was created within the Department of Labor with broad authority to establish standards for the protection of living conditions and promotion of the health and welfare of a group almost universally outside the bounds of protection under state law.

COURT DECISIONS AFFECTING LABOR DURING 1945 [1]

Restraint of Trade.—The United States Supreme Court in two decisions dealt with union activities in relation to the Sherman Act. In the case of the Allen Bradley Co. *v.* Local Union No. 3, International Brotherhood of Electrical Workers (323 U. S. 707, June 18, 1945) the Court held that when a union participates in effecting a business monopoly, it becomes a "copartner" in an unlawful restraint of trade and is subject to the Sherman Act, together with the employer. Union activities to make the New York City area a closed-shop area would have been legitimate under the Clayton Act exempting labor-union activities from coverage under the Sherman Act; but the banding together of contractors, manufacturers, and union to create a monopoly in the area made the union a partner to the Sherman Act violation.

In a case reported simultaneously (Hunt *v.* Crumboch, 323 U. S. 704,

---

[1] Some citations are incomplete because the cases had not yet been published in official reports at the time of writing.

June 18, 1945), the Court, in a 5-to-4 decision, held that the union was not in violation of the Sherman Act when it put a trucking company out of business by refusing, after a labor dispute in which a union member was killed, to supply union workers to the company. The union at the same time refused union membership to anyone working for the company, and executed agreements with several large companies whereby trucking and hauling companies serving them were required to employ union men, thus barring the trucking company against which it had the grievance from participating in such handling and forcing it out of business. The Court declared that a labor union may sell its services when and where it pleases. The minority viewed the case as similar to the Allen Bradley case in that the union joined with businessmen to drive a firm out of business, thus reducing competition in interstate commerce.

Definition of Working Time.—During 1945 there were a number of decisions defining what activities constitute time worked under the Fair Labor Standards Act. Travel time in mines was considered work time by the United States Supreme Court in the Jewell Ridge Coal Corp. case (Jewell Ridge Coal Corp. *v.* Local No. 6167, United Mine Workers of America, 325 U. S. 161, May 7, 1945), following the principle laid down in Tennessee Coal and companion cases early in 1944. The Supreme Court also ruled that time spent by firemen on duty and subject to call was work time, (Armour & Co. *v.* Wantock, 323 U. S. 126, Dec. 4, 1944). Roll call and inspection time were called hours worked in the case of Edmondson *v.* Yellow Truck & Coach Co. (—— Fed. Supp. ——). In another case time spent by piece workers in oiling machines and sorting and attaching work tickets to record sheets was called working time (Walling *v.* Frank, *et al.*, d. b. a. Frank Bros., Dist. Ct. W. D. Kentucky, Sept. 11, 1945).

Veterans.—The job rights of veterans under the Selective Training and Service Act were considered in several cases. The right of a veteran to hold his former job for at least one year, as provided by the act, was upheld by a Brooklyn Federal Court in an August decision (Fishgold *v.* Sullivan Drydock & Repair Corp., 62 Fed. Supp. 25, Aug. 30, 1945). The union involved, however, is taking an appeal. The District Court of Massachusetts ruled that, when two veterans apply for the same job they both held at different times before induction, the employer is obligated only to the first holder of the job (Solymon *v.* London Coat of Boston, Inc. ——, Sept. 25, 1945). A veteran who was ordered reinstated in his former job was awarded back pay for the period of court proceedings in the case of Kay *v.* General Cable Corp., (—— Fed. Supp. ——, March 5, 1945).

Discrimination.—In two California cases it was ruled that a union must open membership to all on equal terms or lose its closed-shop privileges (California Supreme Court in James *v.* Marinship Corp., 155 Pac. (2d) 329, Dec. 1944; California Superior Court in Blackeney *v.* California Shipbuilding Corp., ——, June 4, 1945). In June the New York State anti-discrimination law was held by the United States Supreme Court not to conflict with the Federal Constitution or with congressional authority over postal matters, as was argued by the union which desired to limit membership to eligible postal clerks who were Caucasians or native American Indians (Railway Mail Assn. *v.* Corsi, 65 Sup. Ct. 1483, June 18, 1945).

Union Regulation by States.—During 1945 there were a number of court tests of the constitutionality of state laws regulating and restricting union activities. Section 5 of the Texas law, requiring union organizers to obtain an organizer's card before soliciting members, was held invalid in a particular case because it imposed an improper restraint on the right of free speech and assembly (Thomas *v.* Collins, 65 Sup. Ct. 315, Jan. 8, 1945). Sections 4 and 6 of the Florida law, requiring licensing of business agents and the making of annual reports, were declared unconstitutional because of the penalty imposed (Hill *v.* Watson, —— U. S. ——, June 11, 1945). A union failing to comply with registration requirements would be enjoined from functioning as a labor union, which action the Court held would be in violation of the Wagner Act. A case involving the constitutionality of the Florida "right to work" amendment to the state constitution is on appeal before the United States Supreme Court. The amendment makes unlawful the denial of the right to work on account of membership or non-membership in any labor organization.

EMPLOYMENT CONDITIONS AND STATISTICS

By Irma Rittenhouse
New York Division of Placement and Unemployment Insurance

GENERAL

The year 1945, hostilities having ceased on all fronts, witnessed expected employment declines, but because the end of hostilities occurred near the close of the year, 1945 does not encompass the full post-war layoff period. It rather ended with the initiation of this period.

A downward trend in total employment, reflecting maximum overall absorption of labor for war production, had begun in November 1943, at the time when more efficient use of labor, cutbacks, shifts in military requirements, and completed contracts combined to offset statistically certain continued specific or localized demands for labor. The year 1944 was a leveling-off period for employment, with a slight but persistent downward trend. Employment in munitions (including aircraft) continued to decline from the end of 1944 onward, and the impact of V-E Day on employment was less pronounced than the sharp curtailments of military needs might have suggested would be the case.

It was not until V-J Day that layoffs were sufficiently concentrated in a short span of time to be dramatic in their impact. The number of wage and salary earners (outside agriculture and domestic service) estimated to have full time or part time jobs in August 1945 was 37,015,000; by October it had dropped to 35,207,000 or 3,100,000 less than in October 1944. The greater part of the 12-month decline, it will be observed, occurred in the two months after August 1945. The unanticipated speed of demobilization beginning in September 1945 also brought into prominence the question of employment for veterans, who were being rapidly added to the available labor supply.

Until August 1945, the gradual declines in employment, especially in war industries, were not matched by rising unemployment. This may be attributed partly to the fact that those separated from employment were largely draftees, women workers, and "additional" members of the wartime labor force. While the war continued, laid-off workers were also either able to obtain jobs in civilian occupations promptly, or retired, at least temporarily, from wage-earning employment for various personal reasons.

The labor force sharply increased during the war period, the increase for most age and sex groups being in excess of the normal, which would have been about 3,000,000. It is estimated by the U. S. Department of Labor that about 7,000,000 "extra" persons were in the civilian labor force in April 1945, and that 1,000,000 or 2,000,000 of these "extras" would still be in the labor force in 1950. Increases in the number of those seeking work, stimulated by acute labor shortage or acute labor surplus (such contingencies as war or depression), are never entirely liquidated; certain proportions of the "extra" workers remain available for work. The proportion depends primarily on general employment and wage conditions; if

TABLE I

LABOR FORCE, AUGUST-SEPTEMBER 1945

(in thousands)

	August 1945	September 1945
Total labor force	66,510	64,790
Civilian labor force	54,350	52,900
Unemployed	830	1,650
Employed	53,520	51,250
Non-agricultural	44,470	42,450
Agricultural	9,050	8,800

income from employment is low, or jobs scarce, a larger proportion will continue to seek work than if family income is high.

ANALYSIS OF THE TOTAL LABOR FORCE

Tables I and II show 66,510,000 in the total labor force in August 1945, of whom 19,600,000 were women workers. The proportionate decline from August to September was greater among men than women, probably because young boys left the labor market for school in large numbers in the latter month. Of the "extra" labor force in the spring of 1945, 3,620,000 were males and 3,660,000 were females, according to Department of Labor estimates. It is assumed that about 2,500,000 of the total were youngsters attending school or of school age, and that this source will not continue to yield such large numbers in the future, in view of basic trends toward longer schooling. Of the extra women workers, about 2,600,000 were over 35 years of age, a disproportionate number from this age group. The remainder, a little more than 1,000,000 under 35, were not much in excess of the normal increase in job seekers among young women. The future labor market status of these women workers is uncertain, and depends on a number of factors, among them the return of servicemen-husbands to jobs and maintenance of the present birth rate. The marriage rate is also an important influence, since about 85 per cent of unmarried women have been normally in wage-earning employment, contrasted with only about one-third of married women. The remainder of the "extra" workers were drawn from older persons and males who are on the fringe of employability. It is assumed that a large proportion of this group will cease to seek work, becoming dependent on other sources of income.

TABLE II

LABOR FORCE: MEN AND WOMEN AUGUST 1945

(in thousands)

	Total	Men	Women
Total labor force	66,510	46,910	19,600
Civilian labor force	54,350	35,020	19,330
Unemployed	830	430	400
Employed	53,520	34,590	18,930
Non-agricultural	44,470	27,700	16,770
Agricultural	9,050	6,890	2,160

EMPLOYMENT IN MANUFACTURING

In January 1945, most of the employment decrease, a normal seasonal phenomenon, this year occurred in trade, and the total decrease in employment was less than usual. In munitions manufacturing, the increase that had occurred from November to December 1944 was sustained, but in February employment declines occurred in transportation equipment, shipbuilding, food products, and textiles. In March, further declines in munitions employment occurred, and by May the decline was substantial. Transportation equipment (including aircraft, tanks and shipbuilding) employed 1,772,000 in May as compared with the peak of 2,626,000 in November 1943, and declines continued each month thereafter. In non-munitions manufacturing month-to-month fluctuations during the year were attributable in part to normal seasonal factors but also to irregularities in supply of materials, which affected textiles, apparel, and meat-processing especially. As a consequence of V-J Day, employment of production workers in

TABLE III

INDEXES OF MANUFACTURING EMPLOYMENT

(1939 average = 100)

	All Manufacturing	Durable Goods Group	Non-durable Goods Group
1943 monthly average	154.0	193.8	122.7
1944 monthly average	169.1	231.4	119.9
1945			
January	162.4	219.4	117.4
February	162.0	218.7	117.2
March	160.2	215.5	116.5
April	156.9	210.2	114.9
May	153.6	204.1	113.7
June	150.5	196.9	113.9
July	145.6	187.8	112.3
August	142.5	181.1	112.0
September	123.2	140.1	109.9
October	121.6	136.6	109.7

factories (to which the data in Tables III and IV refer) declined by 1,250,000 in two weeks, but this loss was concentrated almost entirely in war industries. By October, total layoffs from munitions industries had leveled off. Although large declines continued in aircraft and shipbuilding, the heavy industries showed some employment increase. All the non-durable goods industries except food and chemicals showed a slight employment increase in October, and in November a further increase was reported for durable goods except transportation equipment and for most non-durable goods except food products and apparel.

TABLE IV

INDEXES OF MANUFACTURING EMPLOYMENT, BY INDUSTRY, OCTOBER, 1945 AND 1944

(1939 = 100)

	October	
	1945	1944
Total	121.6	123.2
Durable goods	136.6	140.1
Iron and steel and products	120.5	120.5
Electrical machinery	171.2	175.3
Other machinery	167.9	166.6
Transportation equipment, except autos	404.2	486.9
Lumber and timber basic products	91.8	103.4
Non-durable goods	109.7	109.9
Textiles and fiber products	90.3	90.2
Apparel and other finished textile products	100.5	99.8
Food	127.4	133.4
Chemicals and allied products	154.0	155.6

EMPLOYMENT IN MINING

Since the end of 1941, employment in bituminous coal production has been declining, owing in large measure to entrance of miners into military service. By March 1945, employment was 335,000, a drop of 31,000 from March of the preceding year. By July, the need for labor in this branch of mining had become so acute that the industry tried to obtain releases for miners in the armed services. Employment declines continued into October. The low employment index for anthracite mining in May 1945 resulted from the practically complete shutdown of the mines during contract negotiations. The July decline in metal mining employment was owing to recall by the armed services of metal miners who had been furloughed for employment in the mines. Mining employment in general, and especially employment in bituminous mining, declined in October. (See Table V.)

TABLE V

INDEX OF EMPLOYMENT IN MINING

(1939 = 100)

	Bituminous	Anthracite	Metals

October	64.1	n. a.	72.0
November	88.2	n. a.	73.5

EMPLOYMENT ON RAILROADS

The war reversed the pre-war trend toward shrinkage of employment by railroads, and not until 1945 was there any general slackening of the acute demand for labor in this transportation field. In 1944, a total of 3,000,000 persons were employed, of whom 1,090,000 were new entrants and 70,000 were re-entrants to this industry. The employment decline beginning in the summer of 1945 was sharply reversed in September, when pressure on railroad facilities owing to the transfer of demobilized troops became acute. (See Table VI).

TABLE VI

INDEX OF EMPLOYMENT ON CLASS I STEAM RAILROADS

(1935–39 average = 100)

Month	1945	1944	1939
January	142.0	138.3	95.2
February	142.0	139.3	95.9
March	143.0	140.6	95.6
April	141.4	140.6	93.9
May	140.4	140.2	92.7
June	140.6	139.9	95.3
July	139.2	138.4	95.7
August	139.1	139.1	96.1
September	143.1	136.3	98.1

The wartime employment record of the railroads was one of high labor turnover and searches for labor among various emergency sources: older railroad men, students, soldiers, and Mexican nationals. From June 1944 to June 1945, the separation rate from the railroad industry was 7.3 per cent per month, compared to 6.6 per cent in manufacturing. The higher rate was attributable mainly to more attractive wages and working conditions in other industries. The railroads, like the farmers, sought wartime labor from various sources that were regarded as temporary. Older workers who had retired, or would normally have done so soon, were employed, and the Railroad Retirement Board reports that 63,000 older employees were in active service at the beginning of 1945. Employment records showed, however, that most such employees stayed at work for relatively short periods, largely because they found the physical strain too great. Students were called on in the summer months, and servicemen were assigned, especially for freight handling, at various points when freight tie-ups threatened. Women replaced men in a narrowly limited group of occupations, mainly car cleaning, and, in parts of the country where acute shortages of male labor occurred, even in the jobs of track workers and brakemen. An important source of emergency labor for track work was found in Mexico, from which workers were imported on contract by arrangement with the Mexican Government. By June 30, 1945, the Railroad Retirement Board reports, 125,464 different Mexican workers had been employed, and on that date almost 60,000 were still in the United States.

The railroads had the same experience as other large industries with employment trends in 1945. On May 10, they were placed on the "national production urgency list," denoting acute labor shortages (especially on the western roads) and in the fall, as mentioned above, total employment increased. Yet unemployment insurance activities of the Railroad Retirement Board were higher than in the preceding year, and applications almost tripled with the beginning of the new benefit year in July. Laborers formed the largest proportion of the unemployed, and, toward the end of the year, claims were received from women, over-age men, and the less productive workers. In the closing months of the year, unemployment claims were increasing at the same time that employment was rising, reflecting pronounced turnover in railroad personnel, and the slackening of other employment opportunities for the separated workers. However, again like other industries, unemployment claims from workers in this industry were below expectations in the year of the war's end.

UTILITIES AND TRADE

Employment indexes in public utilities and wholesale and retail trade

TABLE VII

INDEXES OF EMPLOYMENT IN UTILITIES AND TRADE

(1939 average = 100)

	January	April	July	September
Public utilities:				
Electric light and power	82.0	82.0	83.5	84.5
Street railways & busses	117.3	118.3	116.8	118.0
Telegraph	120.2	117.9	n. a.	121.2
Telephone	126.1	n. a.	n. a.	133.9
Trade:				
Wholesale	95.7	94.9	95.1	97.0
Retail	98.3	96.8	95.1	97.6

are shown in Table VII (from Bureau of Labor Statistics data). Despite a greatly increased load on its facilities, the electric light and power industry's employment level remained below that of 1939 throughout 1945. Other leading branches of the utilities showed fairly normal employment trends during the year, with seasonal increases in September.

Wholesale and retail trade employment, while likewise relatively less than in 1939 in each of the four months shown, increased seasonally in September and continued to grow toward the end of the year.

EMPLOYMENT IN CONSTRUCTION

Employment in construction in the continental United States increased somewhat in 1945, and in August was estimated at 1,095,000, nearly 250,000 more than a year earlier (U. S. Department of Labor). The main source of increase was in non-Federal, nonresidential construction, in which employment increased from 95,200 in August 1944 to 251,700 in August 1945. There was, however, also a slight increase in employment on private residential work.

Except for Federal employment projects, on which reports are received for both contract and force-account construction, employment data in this field are estimated by the Bureau of Labor Statistics from other construction data, especially value of work. Estimated employment in the continental United States on various types of construction is shown in Table VIII.

After August, some increased activity in non-Federal construction occurred. The wartime limitation on construction (known as Order L-41 of the WPB) was lifted on Oct. 15. Despite acute needs, both public and private, however, the industry was expanding its operations very slowly by the close of the year owing to severe shortages of construction materials and other bottlenecks.

AGRICULTURAL EMPLOYMENT

Agriculture's poor competitive position with regard to labor supply was emphasized during the war, yet even with potential farm laborers attracted by the higher standard of living in urban communities, American farms greatly increased their production with less labor than in 1935-39. The

TABLE VIII

ESTIMATED CONSTRUCTION EMPLOYMENT

(in thousands)

	August 1945	August 1944
Total new construction	1,095.6	875.1
At site	953.8	720.7
Federal	200.0	228.1
Non-Federal	753.8	492.6
Residential Buildings	170.9	107.1
Non-residential buildings	251.7	95.2
Farms	142.2	141.9
Utilities	130.5	95.4
Streets and highways	35.7	38.1
Miscellaneous	22.8	14.9
Other	141.8	154.4
Road maintenance	93.0	95.8

explanation was that more working hours were put in.

The United States Department of Labor reported on wartime changes in agricultural employment in the *Monthly Labor Review* for September 1945. During the war, agricultural employment shrank as a proportion of total employment.

TABLE IX

AGRICULTURAL AND NON-AGRICULTURAL EMPLOYMENT 1940-45

(in thousands)

	July 1940	July 1945	Per Cent Change
Total employment	48,010	54,000	+12.5
Agricultural	10,660	9,670	−9.3
Non-agricultural	37,350	44,330	+18.7

All areas of the country experienced a decrease in hired labor during the war except the Pacific States. Regional differences were partly attributable to changes in production needs.

Family labor still supplies about three-quarters of farm employment, and the most pronounced drift away from the farms is in non-family labor. On the other hand, it is supposed that larger farms fared better with respect to labor supply, owing, of course, to relatively better wages and working conditions.

Farmers drew on women as a source of labor to an unusual extent, and the increase in employment of women from July 1940 to July 1944 was 72 per cent, compared to 63.1 per cent in other pursuits. The employment of males, on the other hand, declined 20.1 per cent for farms and slightly increased in non-farm occupations. Despite the deferment policy, the armed services, as well as job opportunities in business and industry, made severe inroads on the supply of male farm labor. Farm operators resorted to emergency sources of labor during the war (although the main source was still local) and soldiers, vacationists, students, and foreign workers—Mexicans, Jamaicans, Bahamians, and Newfoundlanders — were employed.

Despite the highly seasonal labor shortages experienced, farm operators were also drawn away from their own farms by wartime job opportunities. Continuing a long-time trend, about one-third of them were working on other farms in the peak war year, 1943, but the Department of Labor reports that they also contributed about 1,000,000 man-years (equivalent to 1,000,000 employed for one year) of non-farm work in the same year.

Pressure for agricultural products in the continental United States continued throughout 1945 and was little affected by the cessation of hostilities, which occurred near the end of the season. Wartime employment patterns were continued throughout the main agricultural season, and the emergency labor sources mentioned above were tapped.

PUBLIC EMPLOYMENT

The war caused large increases in Federal employment. At the beginning of 1945, a total of 3,401,791 was employed, of which 3,358,804 were in the executive branch, 6,160 in the legislative, 2,638 in the judicial, and 34,189 in government corporations whose payrolls are met out of their own operating revenues, according to reports by the U. S. Department of Labor. War agencies accounted for 2,513,250 of the employees in the executive branch. When Japan surrendered, a total of 3,800,000 were employed, of whom almost 900.000, mostly laborers, were overseas. Employment had thus quadrupled since the pre-war period. It is generally recognized that, despite sharp employment cuts in both regular departments and temporary agencies when war functions disappear, government employment will continue its long-term upward trend, owing both to increases reflecting general economic expansion (as in the Post Office Department) and adoption of new functions (as in the Federal Security Agency). Ranked by numbers employed as the war ended, the leading agencies were: War, Navy, Post Office, Treasury, Agriculture, Veterans Administration, and Commerce.

Employment levels for August of recent years are: 1939, 982,146; 1941, 1,496,669; 1943, 3,330,416; 1944, 3,388,274; 1945, 3,827,472.

Before the war (1939) state and local governments employed over three-fourths of all public employees. Local governments alone accounted for three-fifths of the employment. By 1944 and 1945, Federal employment was contributing half of the total public employment.

UNEMPLOYMENT

Substantial unemployment did not appear in 1945 until the latter part of August. The end of the war in Europe caused severe cutbacks in certain types of munitions production, with accompanying layoffs, but unemployment because of cutbacks had begun over a year earlier, and although there was a rise in May, June and July, it was not dramatic in trend. Interesting light is thrown on the employment situation prior to V-J Day by labor turnover data. By the beginning of 1945, the rate of voluntary quitting had begun to decline. Reports from workers indicated that there was a general tendency to "hold on the job," since the end of the war was in sight. The total separation rate, however, increased in the summer of 1945, because of scattered but substantial layoffs in war plants, and the accession rate, which in former months had almost invariably counterbalanced statistically the separations from employment, began to decline.

The U. S. Bureau of the Census estimates of unemployed (those able to work and actively looking for a new job) took a substantial upward turn beginning in June. In July, 950,000 were reported as unemployed and looking for work. By October, the estimate was 1,500,000 and, by December, was almost 2,000,000.

Unemployment compensation data cover more different types of unemployment than the Census estimates. The latter are of interest as an attempt to measure the kind of involuntary unemployment that is not "temporary" (*i.e.*, does not involve a layoff of less than 30 days). The unemployment compensation data include temporary unemployment and are somewhat less subjective as to definition of "involuntary" than the Census. On the other hand, unemployment compensation data do not cover all industries or all sizes of firms. Claims for unemployment benefits turned sharply upward in the summer of 1945, and, more significantly, the numbers remaining unemployed (as evidenced by payment of benefits after the waiting period) increased very substantially, and continuously through V-J Day when, of course, new claims again appeared in large volume. Claims filed after layoff (new claims) were 114,285 in October 1944 and 917,519 a year later. Continued claims filed after waiting period (denoting continued unemployment) amounted to only 303,756 in October 1944 and to about 5,500,000 in October 1945.

The incidence of unemployment was uneven in different regions of the country. Social Security Board data are available showing the ratio of claims filed to average monthly employment in the 12 months ended March 1945. As of the week ended Nov. 10, there were only two states, Michigan and Oklahoma, in which claims filed were over 9 per cent of monthly average employment in the preceding year. California, Connecticut, Alabama, and most of the midwest states had unemployment ratios of between 6 and 9 per cent and all others, including New York, Pennsylvania, Ohio, Washington, and Oregon, had ratios of less than 6 per hundred employed. The national average ratio was 5.7 per cent, a decline from a month earlier. The decline was in part owing to job opportunities in peacetime industries that were discovered by the claimants and in part to administrative policy in various states, which was in the direction of disqualifying for benefits workers who declined jobs in their pre-war occupations.

CHILD LABOR

By Ruth Mallay
Special Assistant in Research and Publicity,
National Child Labor Committee

WAR CHILD LABOR FORCE

Children of 14 to 17 years old were used vigorously during the war. Some 3,000,000 boys and girls were part of our war labor force, constituting about one-third of the total number of boys and girls of this age. During the summers of 1943 and 1944, it is estimated that some 5,000,000 children from 14 to 17 years were gainfully employed. There are no official records of children under 14 at work, but there was ample evidence in many American communities that large numbers of them were employed.

A further analysis of the record shows that in April 1944 (the date of the last Census estimate) there were 2,000,000 boys and 1,000,000 girls at work. Of the number, 850,000 were 14 and 15 years old, with boys three times as numerous as girls in this age group. This is four times the number of children, 14 and 15 years old, employed in 1940 when the Census figure was 208,347. The 16 and 17 year old workers tripled between 1940 and 1944 (662,967 to 1,950,000).

Nine-tenths of the 14 to 17 year olds were to be found in four main industry groups: agriculture, wholesale and retail trade, manufacturing, and domestic and personal service. Agriculture claimed the largest number of 14 and 15 year olds, manufacturing and trade the largest number of the 16 and 17 year olds.

High wages attracted many of the young workers into paid jobs in industry during the war years. Others were moved by patriotic appeals to help the war effort. Many 16 and 17 year olds, too young for military service, went to work to still their general restlessness during these years of upheaval.

CHILD LABOR IN AGRICULTURE

The working conditions of non-farm children employed on farms were, on the whole, unsatisfactory during the war years despite efforts to get voluntary agreements on age limits and conditions of employment as a substitute for non-existent state laws regulating the work of minors in agriculture. The recommended 14-year limit for boys and girls, working on a day-haul basis, living at home or in farm work camps and being driven to work in trucks each morning, was frequently ignored, and the usual characteristics of seasonal farm work continued to exist—long hours, low earnings, and poor living conditions in many of the farm work camps. Among the children of migratory farm workers, conditions remained at a substandard level for both living and working in most parts of the country. The only improvement brought about as a result of wartime measures was the day care centers established for the younger children, but these reached only a small proportion of the migrant children. Reasonable standards of living and working conditions for migrants were rarely to be found during the war except in the camps maintained for the migrants brought in from outside of the country under government contract, such as the Jamaicans and Bahamans.

SCHOOL ATTENDANCE OF CHILD WORKERS

It is not surprising to find that high school enrollments fell during the years 1940-44 when 14 to 17 year olds were being drawn into the labor force in large numbers. The decrease in these years was about 14 per cent. In the school year 1943-44, high school enrollments were 1,000,000 less than in 1940-41, a drop from 7,244,312 in 1940-41 to 6,216,119 in 1943-44. Some of the decrease was caused by entrance of 17 and 18 year olds into the armed forces, some by the decrease in the general population of this age group. The main reason, however, was the presence of the large number of 14 to 17 year olds in the labor force.

Half of the 3,000,000 young workers, 14 to 17 years of age, had left school to work full time; the other half (1,400,000 attended school and worked part time. Of these 1,400,000 part-time workers, 1,000,000 were boys.

With the end of the war, school leaving by this age group has apparently stopped. The Children's Bureau reported in October 1945 that "although nationwide tabulations of current school enrollment and youth employment are not yet available, reports from several communities in many sections of the country indicate that the downward trend in high school attendance has been stopped, and that the youth of the United States have caught on to the idea that a high school diploma is worth more than temporary money." The vigorously conducted "National Back-to-School Drive," initiated during the summer of 1944 and carried on for the February term of 1945 and during the summer of 1945, helped to bring the young workers back to school. The Drive, sponsored by the Children's Bureau and the Office of Education, won the support of local communities all over the country. Carried on at the neighborhood level, with parents, teachers, employers, labor leaders, social workers, and other community-minded people back of it, it proved successful. The newspapers and magazines, radio, and motion pictures cooperated in the Drive to help youngsters and their parents realize the need for better education in the years to come.

VIOLATIONS AND ACCIDENTS

The war years saw many violations of Federal and state child labor laws, and an increased number of industrial accidents. Figures tell the story, and crippled children attest the fact. For the first six months of 1944, the North Carolina Labor Department reported the number of child labor law violations (7,576) as 22 times greater than the number found in the first half of 1940 (340). New York State reported five times as many violations for six months, May through October 1944 (11,809), as occurred in the whole year, 1940 (2,452). As for violations of the Federal standards, the Children's Bureau reports that, in its administration of the Federal Fair Labor Standards Act, it found an increase of 100 per cent in the number of violations in the three months, July, August and September, 1944, as compared with the same three months in 1943 (2,327 young workers in 824 establishments in 1944 as compared with 1,064 in 406 establishments in 1943). For the whole war period, the Children's Bureau reports that "more than seven times as many children were found to be illegally employed under the child labor provisions of the Federal Fair Labor Standards Act in 1945 as in the year 1941. These violations occurred in more than six times as many establishments."

Under such conditions it is not surprising to find an increase, during the war years, in the number of industrial accidents among children. Striking increases of 183 per cent and 100 per cent in the rate of industrial accidents to all young workers from 1942 to 1943 were reported by Michigan and Illinois, respectively. In New York City, during the first half of 1944, there were four times as many cases (326) where extra compensation was awarded to minors while illegally employed as compared with the first half of 1943 when there were 90 such cases.

From farm communities come records of children injured in running farm machines, climbing fruit trees, from sun exposure, and in truck accidents. Records from industrial centers report children maimed by machines, killed in falls down elevator shafts, hurt in transportation.

POST-WAR PROBLEMS OF CHILD LABOR

The end of hostilities brought old and new problems of child labor to solve. There are the old problems of state laws with too low standards and of violations of existing laws. There is the added problem of some 2,000,000 boys and girls, 16 and 17 years old, who held wartime jobs and whose work experience can not be overlooked in the period of reconversion and of growing unemployment. "The Children's Bureau," said Katharine F. Lenroot, its Chief, in September 1945, "is urging that communities make every effort to get these young people back into the classrooms. But, at the same time, the Bureau wants the job rights of these young people fully protected, and employment opportunities kept open to the older ones among them."

COORDINATION OF EFFORTS

A lesson learned everywhere in the war period was the effectiveness of coordinated effort. Today, in planning ahead in the child labor field, child labor leaders are seeking the advice and concerted action of government officials, school administrators and teachers, employers, labor leaders, vocational directors, recreation workers, and community-minded citizens.

ENFORCING THE LAWS

"Child labor clinics" for employers were a new development of 1945. It was felt that part of the great increase in violations of existing state and Federal child labor laws was brought about by the lack of knowledge on the part of employers of the provisions of these laws. The Children's Bureau, in the late spring and early summer of 1945, sponsored conferences of employers, called "child labor clinics," to bring to their attention the conditions under which children could be legally employed. With the cooperation of state officials in the Departments of Labor and Education, the regional representatives of the Children's Bureau and the wage-hour inspectors of the U. S. Department of Labor, advised with local groups of employers. The clinics were usually sponsored by such community groups as the Chamber of Commerce, or by service clubs. In some cities, local trade unions sat in at the clinics; in others, separate meetings with labor representation were held. In two cities, representatives from social agencies attended.

The clinic session includes a talk presenting the facts about child labor and is followed by a question-and-answer period. Printed material from both Federal and state labor departments is made available.

The clinics have been well attended. In one such clinic, in New York City, representatives from several associations of employers in the apparel industry, totaling some 8,000 employers, heard how child labor laws applied specifically to their industry. This experiment may prove a fruitful one in helping to enforce existing laws.

RAISING CHILD LABOR STANDARDS—STATE LEGISLATION

Existing child labor laws have still to be improved. Some progress was made in 1945 in remedying inadequacies in state child labor laws, and in improving compulsory school attendance standards.

The Children's Bureau and the National Child Labor Committee have sought for some years to establish a 16-year minimum age "for employment in any manufacturing or mechanical establishment at any time and in any gainful occupation during school hours." This standard has had the support of the American Federation of Labor, the Congress of Industrial Organizations, and the Association of State Labor Commissioners. Thirteen states already have such laws. Illinois in 1945 passed legislation to make a 16-year minimum age effective six months after peace has been officially proclaimed.

Most of the state legislatures met in the early months of 1945, and more than half of them considered major or minor bills to improve the working conditions of children but the gains were limited as only a few bills of major importance were enacted. Hawaii and seven states made some changes in their child labor laws: Illinois, Maine, and New York advanced their standards in important respects while Connecticut, Rhode Island, California, and Nebraska made some changes improving hour or work permit regulations. The only states in the country which had retained a 14-year limit for compulsory school attendance (Georgia, North Carolina) adopted a 16-year limit in 1945, and Oregon strengthened its educational requirement by limiting school leaving under 16 to those who have completed the 12th grade. In addition, New Jersey, Iowa, and Minnesota improved the status, under workmen's compensation acts, of children illegally employed. Michigan, while it did not enact an improved child labor act, established a commission to study child labor problems and to recommend legislation to improve conditions.

In New York, the important change which became effective Jan. 1, 1946, limits the part-time work of children while in school. Children under 16 may not work more than three hours on any school day, eight hours on a non-school day, 23 hours a week when school is in session; 16 year olds may not work more than four hours on a school day, eight on a non-school day, and 28 a week when school is in session.

Maine raised from 14 to 15 the age limit for manufacturing or mechanical establishments, poolrooms and bowling alleys at any time, and added laundries and bakeries to the list.

New Jersey, in 1945, established a Division of Migrant Labor in its Department of Labor. An appropriation of $100,000 was made available to provide better living conditions, health and welfare services, educational opportunities, and fair labor practices for migrant families. Working with the Division are the State Departments of Health, Agriculture, Education, State Police, Institutions and Agencies, and Economic Development.

COOPERATION OF LABOR UNIONS

Labor unions, both A.F.L. and C.I.O., are showing a far-sighted point of view on child labor problems. At their November 1944 convention, the C.I.O. called for: 1. "a broad government program for training and retraining young workers in new vocations, or at higher skills, to be put into operation during the reconversion period; 2. the participation of labor, industry and government in reestablishing and strengthening all Federal and state laws protecting the work standards governing young workers, and young women workers in particular; 3. a program of Federal and state aid to education, assuring an opportunity for young workers now in industry, who qualify for entry into college to do so; 4. the establishment of strict controls over work of minors, and the strict enforcement of existing laws and the enactment of new state legislation to secure the full abolition of child labor below 16 years of age; and 5. the establishment of a permanent National Youth Service Administration that shall serve as a coordinating agency in solution of reconversion and post-war problems of youth."

The Children's Bureau supports the call for government aid to enable students and young workers to continue their education. The Chief of the Bureau has asked for "some sort of system of student aid that would reach high school as well as vocational, professional and technical students."

WORK-SCHOOL RELATIONSHIPS

If young people are to be required to continue their schooling at least to 16 years of age, and encouraged to remain in high school until they finish, high school curricula must be made more meaningful for them. During the war, secondary schools experimented to a greater extent than previously with programs of work experience under school supervision by which their students combined paid employment with school work under plans organized and supervised by the school authorities. Where high standards of planning and supervision were maintained, this use of student manpower was constructive since students were enabled to participate in the war effort without leaving school and gained useful experience in industry at the same time. These part-time work programs under school supervision are now being studied by the National Child Labor Committee and an Advisory Committee representing industry, labor, education, and youth groups. If this kind of work experience is found to benefit the student at a particular period in his growth, it may be important to extend the development of it in secondary schools. A great need today is to find enough meaningful work experiences for young people which will provide them with the training they need and keep them from adding to the unemployment of older workers. A high school curriculum which includes such worthwhile work experiences, either volunteer or paid, will be more likely to keep its young people in school, giving them more training for occupational life and intelligent citizenship at the same time.

COUNSELING YOUTH

Wise counseling of youth is another important need today. If young people are to be encouraged to stay in school, or urged to leave the labor market and return to school in order to make way for returning veterans and generally to keep unemployment as low as possible during the reconversion period, they will need help in working out their problems. Those who left school will have to learn that in some cases their earnings during the war were far out of proportion to normal wages. They, and the students now in school, will need to have made clear to them that they will have to get more education and training if they are to succeed in post-war jobs. They will need wise counseling on jobs now available and the possibilities for job opportunities in the future. Even at a moment when the needs of veterans and the older workers are uppermost, one must not lose sight of the younger worker or the student who will shortly become a young worker.

EVERY CITIZEN'S RESPONSIBILITY

It is by the concerted effort of all citizens that we can best provide for our young people the kind of schooling they will need and the proper conditions under which they will work. These are some of the questions we must ask ourselves today: What will be the best combination of the traditional curriculum and the kind of training needed by the large majority of high school students who will go to work instead of to college? How can the curriculum be adjusted to include courses in education for citizenship and for leisure time? What provision can be made for able students to continue their education beyond high school? What kind of experience should students have in their summer vacation periods and should this be planned and supervised by the schools? Can children be given a creative experience in work without exposing them to the exploitation, deprivation, and injury that "child labor" has meant in the past and still means too often in the present?

SERVICES

The National Child Labor Committee (419 Fourth Avenue, New York 16, N. Y.) offers information on child labor conditions, including changes in the provisions and administration of child labor and compulsory attendance laws. It cooperates in drafting and procuring passage of legislation, conducts investigations on specific phases of child labor or general child labor conditions in a community, and publishes educational material, including a monthly publication, *The American Child.*

The Children's Bureau of the U. S. Department of Labor includes child labor news in its monthly magazine, *The Child,* and publishes many reports on child labor conditions. These materials are available on request. State Departments of Labor also publish reports on conditions in their own states.

The Child Welfare Information Service, with offices at 930 F. Street, N.W., Washington D.C., serves as a clearing house on Federal legislation and activities in the field of child and youth welfare. Organizations working in these fields may subscribe to the Service.

PUBLICATIONS

Most important of the publications prepared by the National Child Labor Committee in 1945 were:

"The Case for Sixteen Year Employment Laws."

"Child Labor as We Move from War to Peace" (annual Report of the National Child Labor Committee) by Gertrude Folks Zimand.

"Child Labor" (reprinted from *The Social Work Year Book 1945*) by Gertrude Folks Zimand

"The State Legislative Council—A Medium for Social Action" (reprinted from *The Compass*, March 1945) by James E. Sidel.

"Wartime Child Labor in Alabama" (*Alabama School Journal*, December 1944) by Louise D. Stetter

"Employment as a Factor in Juvenile Delinquency" (*Probation*, April 27, 1945) by Gertrude Folks Zimand

"Vocational Guidance of Minors" (*Encyclopedia of Child Guidance*, July 1945) by Gertrude Folks Zimand

"Child Labor and the Community" (*Pi Lambda Theta Journal*, May 1945) by Florence Taylor

"Uprooting Child Labor" (*Journal of Home Economics*, October 1945) by Florence Taylor

Publications of the Children's Bureau during the year include:

"Building the Future for Children and Youth. Next steps proposed by the National Commission on Children in Wartime."

"National Back-to-School Drive 1945-1946"

"State and Community Planning for Children and Youth. Proposals of the National Commission on Children in Wartime."

Articles in *The Child*:

- "Ways of Extending Educational Opportunities to Migrant Children," March 1945
- "Young Agricultural Workers in 1944," February 1945
- "Accidents Still Take Toll of Young Workers," August 1945
- "States Improve Child-Labor Standards," October 1945

"Child Labor and Youth Employment in This Nation's Third Year of War" (reprinted from *Social Service Review*, December 1944)

Other Publications:

"Trend of Child Labor, 1940-44" (reprinted from *Monthly Labor Review*, April 1945)

"Teen-Age Youth in the Wartime Labor Force," (*Monthly Labor Review*, January 1945)

DIVISION XVII

RELIGION AND RELIGIOUS ORGANIZATIONS

INTERDENOMINATIONAL ACTIVITIES

By Preston King Sheldon
Editor and Writer

COOPERATION OF RELIGIOUS GROUPS

As the military forces of the United Nations settled down to the task of occupying conquered countries in 1945, having overcome for the time being, aggressive forces which were blocking progress toward world religious and political freedom, there arose in religious circles charges of bad faith and practices. These, however, failed to stir up any great degree of controversy and scarcely at all of distrust. The trend was away from bitterness and definitely toward mutual efforts in solving social and economic problems while remaining free to differ on matters of ecclesiastical policy.

The traditional aloofness among Roman Catholics and Protestants in matters of faith and formal symbols, coupled with equally historic differences over the relative position of Church and State, brought forth from St. Louis, Mo., in October, at a celebration of the 428th anniversary of the Protestant Reformation, a pronouncement by Bishop G. Bromley Oxnam, of the New York Methodist Area, president of the Federal Council of the Churches of Christ in America, emphasizing a tie-up between Roman Catholics and fascism. His charges, however, produced but slight repercussions from Roman Catholics. Replies indicated that the problem of the Roman Catholic and Protestant rift in dogmatic presentations of theology and worship could not be solved, and therefore might better be confined to "pacific controversy," while on a social plane there might be harmonious cooperation. This was suggested by John Courtney Murray, of the faculty of Woodstock College, Woodstock, Md., associate editor of *America*, a Jesuit publication. He discussed the issues at considerable length in an article published by the press service of the National Catholic Welfare Conference and in a tone equally frank and at the same time friendly to Protestants.

Bishop Oxnam had declared in St. Louis that serious tension was developing among Roman Catholics and Protestants in the United States, and that they must discover and remove the causes. Continuing, he said:

"The Holy Catholic Church, that is, the Church universal, is composed of three great branches, the Eastern Orthodox Churches, the Protestant communions and the Roman Catholic Church. I am convinced that the laity, and most of the clergy, of these great branches of the Holy Catholic Church are weary of religious discussion and practice that divide Christians." He said he knew "Roman Catholic statesmen, jurists, industrialists, labor leaders, teachers, scientists and priests" who were eager "to join hands with their Protestant brothers to establish a society in which the sacredness of every personality is recognized."

Calling for "a new unifying concept" for the world at large, Bishop Oxnam declared: "Understanding awaits plain speech. Such speech must be respectful, friendly, and reveal Christian love, but it must be frank and deal with real issues." Then he plunged into what he had to say:

"Protestants are gravely concerned over what they believe to be an attempt upon the part of the Roman Catholic Church to exercise political domination here, similar to the control exercised in many nations. Protestants will fight to preserve religious liberty, not only for Protestants, but for Roman Catholics and Jews, and other faiths. . . .

"Protestants have been subjected to serious misrepresentation in the Roman Catholic press. When Protestants have protested against intolerance upon the part of the Roman Catholic Church, their protests have been called intolerance. It is not intolerance to protest against Roman Catholic activities that seek through boycott to threaten newspapers and therefore to control them in Roman Catholic interest. This is to endanger a free press and to destroy civil liberty. It is not intolerance to protest against actions of certain Roman Catholic leaders to deny Protestant ministers access to the radio by threatening station owners with the loss of consumer support of products advertised. It is not intolerance to insist upon the separation of Church and State, and therefore, to object to the use of public funds for private and sectarian education. It is not intolerance to refuse to accept dictates that would deny Protestant churches the right to engage in missionary work in other lands, at the very moment the Roman Catholic Church affirms its right to carry on missionary work in all lands. It is not intolerance to protest against Roman Catholic support for the fascist regime of Franco Spain, when our sons die to destroy fascism everywhere and to preserve democracy for mankind."

The bishop condemned clericalism and included re-emphasis upon the Protestant position (as outlined in a resolution adopted at the biennial convention of the Federal Council of the Churches of Christ in America, in November, 1944, in Pittsburgh), also in opposing establishment of diplomatic relations with the Vatican. (See THE AMERICAN YEAR BOOK, 1945 printing, p. 670.)

Bishop Oxnam in June, speaking in New York City, had also declared at a rally under auspices of the Federal Council of Churches and the Protestant Council of the City of New York that in countries where Catholicism was predominant there had been discriminations against Protestants, particularly in Italy, where the situation was looked upon by him as serious.

Bishop Oxnam had just returned from several weeks abroad, visiting battle areas, his itinerary including Italy and the Mediterranean Area. He took two trips to Europe in 1945 on behalf of worldwide Protestant unity. He was accompanied on both occasions by Bishop Henry Knox Sherrill of the Boston Protestant Episcopal Diocese. They attended the enthronement in April of the Archbishop of Canterbury, Geoffrey Francis Fisher, successor to Dr. Temple, who had died Oct. 26, 1944, the occasion being the second on which invitations to an Anglican enthronement had included American church leaders. In Italy Bishop Oxnam met in Naples the militant Lutheran pastor, Martin Niemoeller, finding him in good health and spirits. Niemoeller recommended that re-educating of Germans start with the younger generations. He was confident that Christians, because of "a unifying force" at work among them, had the best chance to succeed in preparing Germany's rising generations to take their place in the family of nations.

The second trip was started in November when Bishops Oxnam and Sherrill went to Germany and initiated a survey of the needs of German Protestants. They were joined by Franklin Clark Fry, president of the United Lutheran Church in America, who was already in Europe. Thus determined cooperation was begun among Protestants in both hemispheres which had been prepared for during the better part of a decade. Such activities were being taken along with others as indications of new hope and progress.

The bishops returned in December with a report signed by the three as a delegation of the Federal Council of the Churches of Christ in America sent to re-establish relations with German Protestants. They travelled through Germany, visiting Frankfurt, Stuttgart, Munich, Nuremberg, Hof, and Berlin, conferring with church leaders, including Pastor Martin Niemoeller, who had been elected vice-chairman of the Council of the Evangelical Church in Germany, and Bishop Theophil Wurm of Wurttemberg, chairman of the council.

The Protestants of Germany were reported as comprising 60 per cent of the population and having "a vigorous upsurge of life and activity since the end of the war." This was viewed as "profoundly gratifying in view of the vicious persecution" suffered under the Nazis. The Evangelical Church was reported to be supported by "the overwhelming majority" of German Protestants. They had already begun ridding themselves of Nazis and started to solve the problem of relationship of churches to the State.

A particularly urgent problem, however, was faced by the churchmen—that of supplying the Germans with clothing and bedding to keep them warm through the winter. The American Military Government had taken over the distribution of food, undertaking to supply the minimum requirements of 3,000,000 returning evacuees in the American zone of occupation in addition to the remaining population in the area. Bishop Oxnam, explaining the food situation, stated in an interview that it was felt that for the time being food distribution could be better handled by the American military authorities in the emergency than by private relief agencies, including the churches, from America. He issued an appeal for the churches and relief agencies to confine their immediate relief work to clothing and bedding and to petition the Federal Government for permission to send these supplies to Germany to be distributed by churches there.

DEDICATION OF BOWNE HOUSE AT FLUSHING

A particularly bright aspect of religion's place was found arising from a celebration of the tercentenary of the founding of Flushing, Queens County, N. Y., as Vlissingen, under a charter granted by the Dutch West India Company in 1645. Leaders of all faiths took part on Oct. 10, 1945 in dedicating the home of John Bowne in Flushing, as a national shrine to religious liberty. This historic structure, built in 1661, as a residence, became a meeting place for Quakers. It stands opposite the site where George Fox, early Quaker preacher, preached doctrines considered unorthodox under oak trees in the open air. Mayor Fiorello H. LaGuardia of New York City gave one of his weekly radio broadcasts over the city's station from the home the Sunday before the dedication. He told of Bowne's defiance of Governor Peter Stuyvesant, who forbade the assembly of Quakers and of Bowne's banishment to Holland, his exoneration and return with instructions from the Dutch government to Stuyvesant to leave Bowne and his followers unmolested, establishing thus the right to freedom of religious worship.

AWARD TO RED CROSS HEAD

Another contribution to religious understanding in the United States was the award in November by the National Conference of Christians and Jews of a scroll to Basil O'Connor, chairman of the American Red Cross, as its annual citation on behalf of the conference's program of good will among Roman Catholics, Protestants, and Jews.

POST-WAR CHURCH RELIEF

Consultations among Protestant churchmen, begun in 1933 at Bishopthorp, York, England, instituted by the late Dr. William Temple, at that time Archbishop of York, later of Canterbury, were speeded as the

Second World War drew to a close, having been a constant factor in building up Protestant forces into a World Council of Churches. Postwar plans for such a council, held to be in process of formation even as its organizers proceeded with relief projects for war sufferers, were well advanced as the world began to turn its attention to problems of reconstruction and rehabilitation with a total of ninety Protestant organizations in thirty-one countries pledged. The sudden termination of the war in Europe in May, 1945, found Protestant leaders in the United States prepared to describe the needs for relief work and to launch drives to raise the necessary funds as well as to collaborate in a world unity program.

Dr. Robbins Wolcott Barstow of Hartford, Conn., had been named in January, 1945, as director of a new Commission for World Council Service established in 1944 by the American Committee for the World Council of Churches. (See THE AMERICAN YEAR BOOK, 1945 printing, p. 672.) The commission was set up as the American office of the Department of Reconstruction and Inter-Church Aid in Geneva, of the World Council of Churches and as such was closely related to the Church Committee on Overseas Relief and Reconstruction. Its projects were to include practical expression of Christian unity and world-wide cooperation among Christians. Friends of the World Council received in December a gift of $1,000,000 from John D. Rockefeller, suggested for Christian rehabilitation, reconstruction, and education in Europe. One-half was to finance the commission's overall program and the balance for education and publications and the establishing of a Christian laymen's training center under World Council auspices.

The Friends of the World Council of Churches held their annual meeting in December at the Hotel George Washington, New York City, and approved an urgent request of the Commission for World Council Service for immediate approval of requests of the United Nations Relief and Rehabilitation Administration "for such amounts as are deemed necessary to fulfill its international pledges of aid, and provide timely relief to those in direst need in both Europe and Asia." The request was in the form of a petition to the President of the United States, Secretary of State, Secretary of War, Secretary of the Treasury, and the Congress, calling for the lifting of bans on mail and parcels and the providing of facilities and safeguards "whereby gifts of food and clothing may be sent to individual sufferers in as much of western, central, and eastern Europe and Asia as can be reached." Also it urged: "That all necessary permits, facilities and safeguards be granted for bulk shipments of relief goods into central Europe and Asia by the Commission and other recognized relief agencies."

Immediately following this move, five Protestant groups signed an appeal for Federal Government permission to send church supplies and funds at once to ex-enemy countries. Taking sharp issue with the State Department policy, which prohibited entry of all private relief to Germany, they called for its reversal. They also called attention to the appeal by notifying constituent churches and implied their intent to ask the Government to open the way to similar relief for Japan. The groups represented in the appeal were: Federal Council of Churches, Dr. Roswell P. Barnes; Foreign Missions Conference of North America, Dr. Wynn C. Fairfield; Commission for World Council Service, Dr. Robbins W. Barstow; Church Committee for Relief in Asia, Dr. Fred A. Moore; and Church Committee on Overseas Relief and Reconstruction, Dr. Leslie B. Moss.

With the end of the war in Europe, the Church Committee on Overseas Relief and Reconstruction announced a goal of $6,440,000 for a year. Other needs were announced for auxiliary agencies in addition to goals set by major cooperating Protestant denominations for a four-year period, totaling $100,000,000, of which half was designated for overseas uses. The committee's staff was augmented in

September. By December the committee had announced receipt of a request from the Chinese National Relief and Rehabilitation Administration for goods and funds. Christian workers were also sought, including doctors and nurses. Church Christmas packages began to move. Dr. Leslie B. Moss, executive director of the committee on overseas relief and reconstruction suggested to the churches the setting aside of Thanksgiving offerings at union services to be used for post-war relief. Five major international agencies had united in a European relief appeal by October. These were the World Council of Churches, International Committee of the Red Cross; World Jewish Congress, Save the Children International Union, and Catholic Charities, all pledged "to work together in meeting needs without regard to nationality, race or creed."

Dr. Samuel McCrea Cavert, general secretary of the Federal Council of the Churches of Christ in America, who left in September to work six months with the general staff of the World Council of Churches in Geneva, reported in October that a special division of the council for material aid, which had been set up, was in no way taking over responsibility from the United Nations Relief and Rehabilitation Administration or from military governments. Representatives of the council had decided that the churches had to augment governmental aid programs by special efforts. There was feeling in many circles that government programs were not functioning completely. The Federal Council of the Churches of Christ in America also continued its support of a United Nations Relief and Rehabilitation Administration request for $1,350,000,000 from Federal funds and of the National War Fund.

Collaborators in the program of the World Council of Churches for reconstruction in Europe reached Geneva in July. Dr. Cavert had visited Geneva in 1942 and plans were laid at that time for post-war aid to churches in devastated areas. Dr. J. Hutchinson Cockburn, former moderator of the Scottish Church, became director of relief and reconstruction. Stewart Herman, a Lutheran and former pastor of the American Church in Berlin, was added to the central staff of the relief department as American member. Robert W. Anthony, on behalf of the Church Committee on Overseas Relief and Reconstruction and the Commission on World Council Service, had already visited Italy (leaving the United States in early February and returning in late May) and cleared channels there for work among Protestants.

Protestant leaders from the United States, representing the American branch of the proposed World Council of Churches, reached Germany in late summer. They were welcomed by leaders of the Council of the Evangelical Church in October in Stuttgart, who expressed a feeling of guilt for the rise of the Nazis to power. They committed themselves to a new start with immediate collaboration by joining the World Council.

NEW WORLD ORDER GOAL

While activities of relief agencies of the churches were necessarily intensified in the months immediately following the cessation of hostilities, the goal of permanent world peace and a new economic order was not forgotten.

The American Committee of the World Council of Churches and the International Council of Religious Education had by December worked out a plan whereby the former would set up a midwestern office in Chicago to promote interest in ecumenical Christianity as symbolized by the objectives and program it had been working on, and the latter would agree to promote knowledge of that program through denominational boards of Christian Education in the United States and Canada, which were its constituents. There were 42 of these, together with 30 state councils of churches cooperating in the work of religious education in Sunday Schools, vacation church schools, and week-day religious education. Paul G. Macy was named director of the office of the American Committee of the World Council of Churches and ecumenical secretary of the International Council of Religious Education. The intent was to train religious educators with a world Christian attitude and lead churches to recognize their responsibilities to the world program of Protestantism. A staff conference of the international council was held in Chicago in December to formulate plans and organize for conducting projects which its staff had outlined in 1942 and which had been revised by its commission on education, but which had been held in abeyance until adequate effort could be given. The program's delay was attributed to pressure by wartime duties on the staff and personnel concerned.

The World Council of Christian Education, governing body of the World's Sunday School Association, announced in December a world program to strengthen Christian leadership in 55 countries in which had been organized 52 national Sunday School associations or councils of religious education, including the International Council of Religious Education. Dr. Forrest L. Knapp, general secretary of the Association, reported 38,000,000 Protestant teachers and students enrolled in Sunday schools in these countries. Collaboration was also reported with the Eastern Orthodox Church in Palestine, Syria, Egypt, and Greece.

The world post-war program through the Association's facilities included a start on restoring 400,000 Christian teachers and youth leaders in war-torn countries and the expanding of training work to procure more of them. This program had in the United States a committee of government, educational, business, and industrial leaders, and included several former Federal officials, among them Cordell Hull, Secretary of State under Franklin D. Roosevelt.

The heads of seven national governments, including President Truman, endorsed an appeal for the fulfillment of the Christian church's teaching mission, the appeal having been prepared especially for publication in connection with the Association's launching of a drive for funds to carry out the world program. The other signers of the endorsement were King George VI, President Chiang Kai-shek, King Christian X of Denmark, King Gustav V of Sweden, King Haakon VII of Norway, and Queen Wilhelmina of Holland.

The statement in part declared that the structure for world organization for peace "must rest upon the solid foundations of strong moral and spiritual character in the life of all peoples everywhere. The world must look to the Church to lay those foundations, especially in the lives of children and youth."

Dr. Knapp, in his semi-annual report, told of a request from Isamu Chiba, secretary of the Sunday School Board of the Church of Christ in Japan, for information on Sunday School activities throughout the world, particularly in the United States, "to supply us with anything which will show the Japanese children that America is a very good friend and neighbor to them, who have been taught in these years by the militarists that the Americans were demonic enemies to be hated to the end." The Japanese secretary reported that the Sunday School Board of the Church of Christ in Japan did not cease its work all through the war. It continued to publish lesson materials and hold teachers' meetings. The Board shortly after the cessation of hostilities announced it was planning lessons for the "new, free and democratic age."

Three national inter-church agencies in the Western Hemisphere joined in October in calling for dropping of materialistic concepts of self-interest and power and for a spiritual reformation. The agencies were the Federal Council of the Churches, the Foreign Missions Conference of North America, and the American Committee for the World Council of Churches. The call was sent to heads of church bodies in 50 countries, appealing for a total mobilization of

Christian forces all over the world to support the United Nations Organization and to give relief to war sufferers.

"We see in the San Francisco charter (the United Nations Charter) the promise of a true community of nations," the message stated. "We are gratified that the United States has already ratified the Charter. We look forward to the day when the United Nations Organization will displace the anarchy of competing and unrestrained sovereign states. We believe that an enduring peace requires that all nations willing to accept and fulfill the obligations of the Charter should thereupon be made members of the United Nations Organization. We believe the treatment of Germany and Japan should aim to bring these nations at an early date into normal relations with the world community. Just as the war was a global war, so the peace, if it is to endure, must be a global peace.

"We are determined to work for the continued expansion of the curative and creative functions of the United Nations Organization, for the fulfillment of the purposes assigned to such agencies as the International Court of Justice, the Economic and Social Council, the proposed Commission for the Promotion of Human Rights, and the Trusteeship Council. We desire to be associated with Christians everywhere in the task of making the United Nations Organization an effective instrument for the removal of the political, economic and social causes of war, for the peaceful settlement of disputes and the achieving of justice in international relationships."

As its contribution, the Federal Council of Churches was represented at the United Nations Conference in San Francisco, in the spring by Dr. Walter W. Van Kirk, secretary of the Council's Commission on a Just and Durable Peace. He was assisted by Bishop James C. Baker, Methodist, of Los Angeles, chairman of the International Missionary Council, and by Dr. O. Frederick Nolde of Philadelphia, secretary of the Joint Committee on Religious Liberty of the Federal Council and the Foreign Missions Conference of North America.

John Foster Dulles, chairman of the Council's Commission on a Just and Durable Peace, was relieved of his duties temporarily during 1945, to enable him to give full time as general adviser to the American delegation at San Francisco. The Commission had rallied a conference of 481 delegates in January, at a scheduled meeting in Cleveland, where the Dumbarton Oaks Proposals were hailed "as an important step in the direction of world cooperation," but nine amendments were proposed. Approval of the proposals themselves was a first step toward achievement of a postwar world order consonant with the guiding principles and Six Pillars of Peace promulgated in 1943 by the commission under a former status (see THE AMERICAN YEAR BOOK, 1944, p. 635) was embodied in a 6,000-word message to the churches in January at the end of the national study conference on the churches and a just and durable peace. This came as a sequel to the conference held in Delaware, Ohio, in 1942 (see THE AMERICAN YEAR BOOK, 1943, p. 632) at which guiding principles were drawn up.

The message embraced a declaration of Christian principles, an appraisal of the international situation, and a program of action to insure winning the peace. It was sent for study and action to all the Protestant communions, allied groups and city and state councils of churches represented. The Cleveland conference attracted 100 more than the one in Delaware, two years previously, 34 communions, 18 allied bodies, and 70 city and state councils sending delegates. Four principles of conduct were suggested in addition to the nine suggested amendments to the Dumbarton Oaks proposals and four provisions in accord with the Six Pillars of Peace, using the guiding principles adopted at Delaware also as a yardstick.

In brief, the amendments covered: reaffirmation of the purposes of the Atlantic Charter; development and codification of international law to achieve the progressive subordination of force to law; denying any nation the right to vote when its case was being judged in accordance with predetermined international law; liberalizing the provision for amendments which required concurrence by all permanent members of the Security Council; creating a special agency on colonial and dependent areas to establish their progress toward autonomy as an international responsibility; establishing a special Commission on Human Rights and Fundamental Freedoms; specifically providing for eventual universal membership; making more specific provision for promptly initiating limitation and reduction of national armaments; and creating provisions designed more clearly to protect and defend smaller nations from possible subjection to the arbitrary power of the great nations.

The four principles of conduct were: that government adopt and publicly proclaim its long range goals and skilfully battle for its ideals and under conditions that no particular setback need be accepted as definitive. When the people had demanded these from their government, the conference stated, they should judge it not merely by immediate results but by its long-term objectives and by whether it works competently to achieve them. These recommendations on the Dumbarton Oaks proposals were sent to the President of the United States, Secretary of State, and members of Congress.

Discussing the peace settlement in Europe and Asia, the conference in Cleveland urged a peace that would remove "the power and will to wage war" from both but emphasized that a vindictive course would be to the disadvantage of the world in the struggle for world organization. Unilateral determination of boundaries in Europe was opposed as well as the forced partitioning of Germany. The fullest measure of autonomy for smaller and weaker nations consistent with European unity and world organization was asked. As to peace in Asia, the conference stated that it was of urgent importance that China be heard in international affairs and that she be provided with unrestrained opportunity for internal development. It also declared that Japan's basic economic problems required that access to trade and materials, pledged by the Atlantic Charter, must be extended to her and added that the aim of the United Nations should be to bring Japan into normal relations with the world community. Encouragement of constructive forces in Germany and Japan was urged.

THE WORLD ECONOMIC PROBLEM

Considerable attention was given to the economic problem, domestic and international, and its relationship to just and durable peace. The conference said a new challenge was offered to the people of America to establish, along with political democracy, an opportunity through productive employment to earn an income sufficient for basic needs and an assurance to everyone, regardless of race, of equal and unsegregated opportunity to worship, protection in time of unemployment, illness or need, and full civil and political rights. Need for experimentation with various types of ownership and control was recognized—private, cooperative and public. It said changes in the American economic system in the direction of more social planning and control might be necessary, with more regulation of the rights of private property and freedom of enterprise.

"A challenging effort in the United States in the solution of our domestic and economic problem," the conference concluded, "will be followed by favorable repercussions in the economic and spiritual world, thus contributing to the establishment of a just and durable peace." To prevent recurrent depressions, the goal of full employment of labor and of economic resources on a world scale must be continuously pursued, it continued, and poverty must be attacked by helping men everywhere to raise their standards of living. A world point of view must be developed in which the United States must actively participate.

THE PROBLEM FOR PROTESTANTS

The Cleveland conference turned to the problems of Protestant communions and made it plain that denominationalism was not adequate. A more vital and visible federal unity was urged. Greater attention was urged to education in techniques to build a Christian world community and to teaching children conditions of world peace; to using all facilities of Protestant churches to secure American participation in international cooperation, church assistance in relief, and reconstruction in war-ravaged areas; active support of proposals to legalize a permanent Federal Fair Employment Practices Commission; repeal of the poll tax and other discriminatory laws; housing projects and other measures designed to advance the well-being and constitutional rights of Negroes and other underprivileged groups. Study conferences were suggested on industrial relations and rural economics and on race relations. The conference further concurred in resolutions of the Federal Council of Churches, and several other religious and educational bodies, urging deferring of Congressional action on peacetime military conscription until after the war.

AN INTERFAITH VIEW

Pronouncements on moral principles of a just world order also came out in a joint statement of Roman Catholics, Protestants, and Jews in April, agreeing on ten recommendations for the United Nations Charter which was about to be drafted in San Francisco. Stressing the need of a world security organization, the statement called for open membership; codification and impartial enforcement of international law; revision of treaties and other agreements when justified in the interest of world welfare; safeguarding of political and economic rights of small nations, assuring them adequate participation in shaping policies; limitation and control of armaments as a clear purpose; that no nation be permitted to veto judgment in any dispute under international law; an international bill of rights, with commissions to protect rights and liberties of individuals and those of racial, religious, and cultural groups, and a commission to administer mandated territories and promote social, political, and economic progress among non-self-governing peoples.

After the United Nations Conference had ended in San Francisco, the executive committee of the Federal Council of Churches, stated: "The Charter of the United Nations offers mankind an important means for the achievement of a just and durable peace." The committee felt that the proposed United Nations Organization could "help governments to join their moral and material resources in support of a system of world order and justice." To the people of the earth, it added, was left responsibility for its success.

A program of strategy was announced in November by the Commission on a Just and Durable Peace, headed once more by John Foster Dulles, who reported on the international situation at a meeting of the commission in Philadelphia to determine its part in supporting the successful operating of the world's new peace program. In a statement sent to the churches, the commission declared its intention to exert its strength to prevent war this time from perpetuating itself, by breaking the cycle. Re-emphasis was put upon the principle objectives, which by now had become repetitious in their insistence for action on them. Territorial changes were recommended only when conforming to the desires of the inhabitants; independence and self-government was urged for colonial peoples; and that limitations be put upon armaments, and upon reparations, so as not to lower living standards for peoples paying them.

INTERNATIONAL CONTROL FOR ATOMIC POWER

Meanwhile the Commission had on its hand the problem of nuclear energy and atomic bombs. International controls over all atomic power were recommended personally by Richard M. Fagley, secretary of the Commission, in a statement published in August, and by John Foster Dulles, speaking at a dinner meeting in November in connection with the installing at Riverside Church, New York City, of Dr. Henry Pitney Van Dusen as president of the Union Theological Seminary. The occasion was of more than usual significance in that 400 religious educators and clergymen of this and other countries, many of them heads of theological seminaries, were present. Among them was Dr. Adolphe Keller, former director of the Central Bureau for Interchurch Aid, Geneva, Switzerland, who flew here to represent the theological faculties of Basel, Lausanne, Geneva, Zurich, Bern, and Neuchatel and Bishop A. E. J. Rawlinson, of Derby, England. Dulles called for submitting control of atomic power to the General Assembly of the United Nations Organization, saying "the power we want is the power of world opinion." In September the Federal Council of Churches urged such a step as the first order of business for that body and called upon the Federal Government "to state now its intention to place the new discovery under a world-wide authority as soon as all states will submit to effective controls," and immediately to work for the creation of such controls. The Council's executive committee warned that the danger of atomic war is "too great and imminent to permit neglect of any means calculated to lessen or delay it." Technical and political obstacles standing in the way of international controls can be overcome, the Council declared, "if governments and peoples are determined to establish the sovereignty of mankind over destructive atomic power." Otherwise the struggle among competing states would tend to precipitate total war, because of mutual fears of aggression.

The Council also called attention to "the curative and creative work envisaged under the provisions of the Economic and Social Council," urging "our government to give leadership and loyal support to the economic and social work of the United Nations."

SOCIAL PROBLEMS

Social maladjustments arising from war conditions were stressed at home by the Federal Council, in continuance of its previous activities in that direction. It supported extending old age and survivors insurance to agricultural workers, domestic servants, employees of non-profit organizations, and the self-employed; a sound plan of public health and disability insurance; and the including of churches in a Federal social security plan offering protection to lay employees.

A second action was an appeal early in 1945 to church members to support all "sound and effective measures for a thorough housing program, urban and rural, including community planning for all groups and races, slum clearance and rehousing when necessary." It also urged churches to approve the general principle of assistance by Federal, state, and local governments, without passing judgment on any particular legislative proposals. Dr. Samuel McCrea Cavert testified in favor of legislation to establish a Federal Fair Employment Practices Commission with enforcement powers, at a hearing in March before members of the United States Senate Subcommittee on Education and Labor. He said there was "an awakening conscience in the Church on the question of justice for minority peoples in our national life."

In its annual message for Labor Day, the Federal Council urged cooperation among government agencies, the churches, employers and workers in rebuilding the post-war world and laid down nine tasks embracing factors making up the demands of society for social and industrial harmony. These objectives reemphasized the many points on economic, social and industrial relations repeatedly made in previous pronouncements.

UNITED COUNCIL OF CHURCH WOMEN

In preparation to lend its aid to the promoting of wide understanding of the United Nations Charter, the United Council of Church Women, through its executive committee, was recorded in May, 1945, as ready to distribute copies of the text through state councils of church women, aiming to have the text reach local councils. It issued a public statement and cooperated on a national scale with other groups "bearing constantly in mind the plans of the Commission on a Just and Durable Peace." It placed responsibility on church women to "develop attitudes necessary for getting the international machinery to work." On international unity the United Council of Church Women resolved "that the world must be physically restored before a stable peace can be achieved," and reaffirmed "willingness to share food, goods and money for such restoration." It also declared: "Further, realizing that peace is not secured until a spirit of trust, confidence and cooperation exists between the nations," the Council "urges that all possible means be used to build good will and unity." It said: "Especially must this be carried out among the United States, Great Britain, Russia, and China." The women urged "particular cultivation of understanding and friendly relations with the Soviet Union."

In furtherance of its spirit of sharing, the United Council of Church Women called for the United States to lead in seeing that material supplies were forthcoming for Europe, the war in that area having ended at the time the appeal was made. The women urged continued price control and rationing and "our government to fulfil promptly its obligations under the United Nations Relief and Rehabilitation Administration." They pledged increased support also for church relief agencies.

In June the women pronounced a protest against delays in Congress on appropriations for continuance of the Federal Fair Employment Practices Committee and urged its State Council presidents, in an emergency call for action to stimulate the sending of telegrams to President Truman, to United States Senators and members of the House of Representatives calling for favorable action on the proposal. In November the executive committee voted to oppose compulsory military training and censured the city of Washington, D. C., where it was meeting, for discriminating against Negroes.

The World Alliance for International Friendship through the Churches announced a program for 1946 which included sending deputations to Europe and South America and a strengthening of its educational campaign for durable world peace. It cooperated with the Church Peace Union and a number of other national organizations such as the American Association for United Nations, the Commission to Study the Organization of Peace, the Council for Democracy, the Council against Intolerance in America, and the Free World Association. Its *News Letter* throughout 1945 carried reports of reactions to current religious and political activities in the general movement to establish a United Nations Organization.

RESUMPTION OF MISSION WORK IN JAPAN

Resumption of relations between Protestant churches of the United States and Canada and Christians in Japan was initiated soon after the end of war in the Pacific as the result of action taken in September by the Japan Committee of the Foreign Missions Conference of North America. The way was opened for deliberations by 38 constituent mission boards on the part they might take in missionary work in Japan. As a beginning, 13 Protestant denominational foreign mission boards and agencies agreed to resume work in Japan in a united Christian program by pooling their personnel, resources, and administration. Ten others started a consultative status, the remaining boards standing by to keep in touch. The groups deciding to resume missionary work in Japan were the foreign mission boards of the Reformed Church in America, the United Church of Canada, and its Woman's Missionary Society, Methodist Church, Evangelical and Reformed Church, Congregational and Christian Church, Disciples of Christ, Presbyterian Church in the U. S. A., Evangelical Church, Methodist Women's Division of Christian Service, the subcommittee on Pacific Areas of the American Section of the Friends World Committee, the United Brethren in Christ, and the United Lutheran Church in America.

Protestant unity was found to be firm in Japan and a sincere desire for democracy was reported by a deputation of Protestant leaders who went there by air in October and returned in November. They were Dr. Walter W. Van Kirk, secretary of the Department of International Justice and Good Will of the Federal Council of Churches; Dr. Luman J. Shafer, chairman of the Japan Committee; Dr. Douglas Horton, chairman of the American Committee of the World Council of Churches, and Bishop James C. Baker, of Los Angeles, chairman of the International Missionary Council.

Lack of resentment toward American soldiers by the Japanese was reported, along with a feeling of resentment by them toward their military leaders by whom they felt themselves to have been misled in the war. Each of the deputation had a brief interview with Emperor Hirohito, at his invitation, and conferences were also held with cabinet members and with Toyohiko Kagawa, Japanese Christian leader. The Japanese emperor inquired of each about the work of American churches and the possible significance of Christianity in the reconstruction of Japan. Their audiences were widely reported in the Japanese press and were believed to have enhanced the prestige of the Christian movement in the mind of the Japanese public. Conferences with the Japanese Premier, the Minister of Education, Minister of Public Welfare, and the Japanese Foreign Minister also centered on the task of Christianity in rebuilding Japan. Kagawa was found to have undiminished faith in the future of the Christian enterprise.

The *Nippon Times,* in a two-column editorial on the visit of the American religious leaders, commented that the work of the deputation "is bound to mark a significant first milestone on the road to Japan's return to the international fellowship of peace-minded peoples."

Steps were taken by the Japan Committee immediately after their return to provide hundreds of thousands of Bibles, hymnals, and other items of Christian literature to Christian churches in Japan. The committee voted to ask the American Bible Society to arrange to send at the earliest possible moment 100,000 New Testaments in English, specifically requested by Japanese Christians. The Society also reported in December of receiving calls for Scriptures from Germany, China, and "hundreds of other spots on the globe." Various denominational groups were reported to have demonstrated their confidence in the Society's war emergency program by giving more than $1,000,000 since July, 1940, above the amount given for regular work of the Society. It was also preparing to distribute Scriptures in Russia "if and when such distribution" was allowed. In May the Society reported for 1944, the distribution of 12,403.541 Bibles, Testaments, gospels, etc., as the largest annual distribution in its history.

MOSLEM MISSIONS

The Foreign Missions Conference also reported that Dr. Gloria M. Wysner, executive secretary of the Committee on Work Among Moslems, had gone for a five-months survey of Protestant missionary work in Algeria, Tunisia, Egypt, Syria, Lebanon, Palestine, Iran, Iraq, and Turkey. Dr. Wysner, who had prepared late in 1944 for private circulation a statement on the "Dilemma in Palestine," issued by her committee, found it necessary to issue reprints in April, 1945. The statement emphasized a conflict between political Zionism and the struggle of Arabs for political freedom from outside interference in setting boundaries. It made a clear distinction between cultural Zionism and political Zionism.

PALESTINE PROBLEM

"Upon the interpretation of the phrase 'a National Home in Palestine' has hinged great misunderstanding," the statement said. "Arab fears have focused on this. For the political Zionist a national home means eventually Palestine as a 'national State' with the Jews in control of the country. The Arab looks upon this as a planned effort to deprive him of his inherent rights in Palestine and to make of him a minority people, and this without his consent. Cultural Zionists interpret a national home as a place where the Jew may develop his cultural interests and to which he may look as the center of his Jewish life. Cultural Zionism had been developing slowly in Palestine through the centuries preceding the First World War, encountering little difficulty from the Arabs. . . . A national home in Palestine would have the support of some Arabs, although perhaps not the majority, but all Arabs would oppose Palestine becoming a national Jewish state." Dr. Wysner detailed the many attempts at solving the Palestine problem and cited the Balfour Declaration of Nov. 2, 1917 as causing confusion and dismay among the Arabs. She charged that France and Great Britain had in a scheme of mandates "imposed upon the Arabs a settlement which violated the promises made to them." Efforts within the United States to aid refugee Jews in returning to Palestine as well as Jews to go back from here were likewise complicating the problem, she indicated.

In a pronouncement in October, the Foreign Missions Conference called on Christians to "initiate a more positive and vigorous program to eradicate anti-Semitic feeling" in the United States, sending the statement to world religious leaders. It declared the refugee problem to be immediate and said that the number of surviving Jews "who may prefer Palestine" for a permanent home was not clear. "Insistence by Jewish nationalists that Palestine is the only possible haven for Jewish refugees, in the face of the political impasse in that country, seems to us definitely to obstruct their rescue by all other means."

HOME MISSIONS PROJECTS

In keeping with the general trend to render aid to the needy as a result of war conditions throughout the world, the Home Missions Conference of North America announced in September the start of its work among needy groups of Americans at the outset of post-war reconversion. Leadership in religious activities was continued for former war workers in industrial areas where it had been conducted in the war period, but with the responsibility placed in the hands of a newly organized Industrial Committee, which took over the work of the Christian Commission for Camps and Defense Communities as soon as it disbanded. As early as the second week in September, millions of war plant workers were reported out of jobs and faced with new needs. Churches near government housing projects and trailer camps were urged to take steps at once to aid them. Many were remaining in industrial centers and becoming integrated permanently in new communities. Stanley U. North of the Congregational Christian Churches' Board of Home Missions was made chairman of the new committee.

A particularly distressing problem faced was that of relocating Japanese Americans remaining in eight relocation centers because of an advanced date of closing these centers. Toru Matsumoto, director of the Council's Committee on Resettlement, reported these difficulties following a national conference in New York City on Nov. 8, attended by representatives of religious and social agencies. The problem was being met by the organizing of community groups in several cities to take care of the problem in separate areas.

The Council announced in October a drive to recruit young men for careers in the ministry in rural churches. They were wanted particularly near campuses of agricultural colleges. Other problems the Home Missions Council started to work on included those of uprooted residents in congested housing areas in the reconversion period, a report having disclosed that only 25 per cent of residents in government housing projects had intentions of going "back home." Progress was reported in the work of establishing ministers among Negroes in rural areas, also. The Council, which entered its twenty-sixth year in work among migrant agricultural workers, found itself in the summer of 1945 serving 600,000 of them in 23 states, promoting church services, Sunday schools, Bible classes, recreation programs, counseling, language classes, and other activities. Of the migrants, 85,000 had come from Mexico, Jamaica, the Bahamas and Barbados Islands, under contract with the War Food Administration, with special housing protection.

Officials of the Home Missions Council were joined by Roman Catholics and Jews just before Christmas in calling attention to problems arising from the importing of these migrants and protesting conditions in the United States among migrant workers in agriculture. Adequate legal protection was urged under the Fair Labor Standards Act and the Social Security Act. Agricultural workers were reported to have no protection on minimum wages, workmen's compensation, old-age and survivor's insurance and unemployment compensation such as industrial workers were receiving. The signers of the protest included Msgr. John O'Grady, secretary of the National Conference of Catholic Charities; Msgr. Luigi G. Ligutti, executive secretary of the National Catholic Rural Life Conference; Dr. Hermann N. Morse, president of the Home Missions Council, and Dr. Mark A. Dawber and Miss Edith E. Lowry, its executive secretaries; Rabbi Herbert S. Goldstein, president of the Synagogue Council of America; and Gabriel Davidson, managing director of the Jewish Agricultural Society.

CHURCH PENSIONS BOARD

Average investment income of the pension boards of 21 major Protestant denominations and the national Y.M.C.A. and Y.W.C.A. for the year ended Nov. 1, 1945 was reported as 3½ per cent. Continued low interest rates were expected to make necessary the building up of larger reserves in anticipation of lower earnings, it was reported at the thirty-first annual Church Pensions Conference in New York City in November. The total investment income of the 23 agencies was $8,324,597. Total membership of the bodies reporting was 32,512,259. The number of ministers and secretaries was 126,415. The congregational and group units were 145.148. The number of pension beneficiaries was 34,146, an increase of 1.3 per cent. Benefits paid amounted to $14,928,038,844, an increase of 4.5 per cent. 828. The total of beneficiaries of all types was 43,053 who received 3.9 per cent more than the previous year. Total funds administered were $245,038,844, an increase of 4.5 per cent.

PROTESTANT DENOMINATIONAL ACTIVITIES

By Preston King Sheldon
Editor and Writer

MEMBERSHIP STATISTICS

Gains in membership were reported throughout 1945 by Protestant denominations where records were available. In several cases periodic conventions were omitted because of restrictions upon meetings by the Office of Defense Transportation. In others, convention sessions were shortened and attendance was reduced to comply with wartime regulations. Reports in most cases, therefore, were far from complete, except on post-war planning.

While the *Yearbook of American Churches,* edited under auspices of the Federal Council of the Churches of Christ in America, came out in 1945, disclosing that Protestant churches had 72,492,669 members, or above 52 per cent of the nation's population, the underlying figures were mainly for church years ending in 1943 and 1944. The last previous issue of the *Yearbook of American Churches* had been published in 1943. The 1945 edition revealed an increase in members of 3,991,483 with 256 religious bodies reporting. Further reports in 1945 changed this but by how much it was impossible to tell. The Protestant bodies also reported having 253,762 churches. Twenty-three Baptist bodies reported a total of 14,208,193 members; 20 Methodist bodies had 9,924,842 members; 20 Lutheran had 5,129,147 members.

OVERSEAS RELIEF

American Protestants were engaged in raising at least $50,000,000 for overseas relief and reconstruction programs for a four-year period, beginning July 1, 1945, and their efforts were largely being directed not only to that end but to organizing for administering funds when received. Personnel was needed to carry on distribution of money and relief supplies and render various other forms of aid and encouragement to the needy and suffering, particularly refugees. No small part of the whole problem was the necessity of restoring bombed out churches, supplying temporary places of worship, shelters, housing, and personnel to take up again the routine work of the Christian Church where it had been halted by war.

Of the total amount of money sought by Protestants for the overseas needs, $19,132,500 was designed to carry out a combined program of Protestant churches under the Church Committee on Overseas Relief and Reconstruction. The remainder was expected to be distributed by individual denominations through their own churches overseas and to special interest projects not represented in the united undertaking. These figures were separate from the current mission program of the churches and were specifically related to needs overseas arising from the war.

The denominations participating in the united program to raise the sum for the Church Committee on Overseas Relief and Reconstruction, included: Northern Baptist, Southern Baptist, Seventh Day Baptist, United Brethren, United Brethren in Christ (old constitution), Church of God, Congregational-Christian, Disciples of Christ, Evangelical, Evangelical and Reformed, Religious Society of Friends, Lutheran, Moravian, Methodist, Presbyterian (U. S. A.), Presbyterian (U. S.), Protestant Episcopal, Reformed Presbyterian Church in North America, Christian Reformed, United Presbyterian, Assemblies of God, Church of the Brethren, Churches of God in North America, and Universalist.

Dr. Leslie Bates Moss, executive director of the committee, reported in the autumn that more than 30,000,000 American Protestants could be relied upon to favor continued rationing and other necessary measures to meet minimum food requirements in the winter in Europe.

PROMOTION OF WORLD BROTHERHOOD

Under the impact of facing war needs and the sudden shock of the atom bomb which had a stimulating effect upon moral consciousness, Protestants along with other religious motivated groups were dropping old controversies and taking up in unheard of enthusiasm the task of mutually working to promote world brotherhood. New understandings were spread by interchanges of visits among religious leaders here and abroad. The object was to resume contacts with fellow Protestants throughout the world and to start anew on the missionary projects of the churches. There was more willingness to work with rather than compete with one another, and through the fast growing movement for a worldwide Protestant church organization, the ideals taught by Christian leaders for centuries were being implemented in cooperative measures to relieve sufferers, minister to the sick, prevent juvenile delinquency, the spread of social, economic, and racial tensions, and of social evils and diseases, and in other measures being taken to merge some communions so as to strengthen Protestant Christianity in its weak spots. Where mergers were not contemplated or possible, there was a greater degree of federated activity than had existed before the war. The trend toward world organization was found to be mounting in the direction of complete organization of a World Council of Churches for Protestants, with headquarters in Geneva, Switzerland and of urgent emphasis among Protestants upon putting their efforts into the building of the United Nations Organization, buttressed with a sense of moral responsibility.

VISIT OF THE DEAN OF CANTERBURY

Of particular moment in 1945 among Protestants was a visit to the United States by Dean Hewlett Johnson of Canterbury, who spoke at Protestant church gatherings in New York City, Boston, and Chicago, visited Joseph E. Davies, former Ambassador to Russia, in Washington, D. C., and spoke at a rally in Madison Square Garden, New York City, attended by thousands of listeners under the auspices of the National Council of American-Soviet Friendship. Interest was keen in what would be the dean's report on a trip he took in the summer of 1945 through western and central Asiatic republics of the Soviet Union and his interviews with Patriarch Alexei, of the Russian Orthodox Church, and Stalin.

The dean told a group of clergymen of all faiths brought together in New York City on the invitation of Presiding Bishop Henry St. George Tucker of the Protestant Episcopal Church, on Nov. 15, 1945, that he had found a new religious spirit arising in Russia. He looked upon Russia's younger generations as "fruitful soil" for the Christian message but declared "it must be real Christianity" and "a real faith in God" and not merely "ideas about God." Questioned by a heckler as to whether the word God was spelled with a capital "G" in Russia, the dean brought a round of applause from some 500 clergymen when he silenced his questioner by saying: "It isn't how you spell the word, but the reality behind it that means the most." He reported that Stalin had told him of a new spirit of friendliness between Church and State in Russia.

Greater understanding among the peoples of all nations was being stressed by all religious leaders in 1945 who took pains to include those of former enemy nations. This spirit was extended toward Germans through contacts made by Protestant leaders from America with Protestant leaders of Germany. Greater unity was expected among European Protestants and friendship among the peoples of the United States and Russia was continually stressed by American Protestant leaders. The mission program in Japan was also made ready.

SEVENTH-DAY ADVENTISTS

The number of members in churches throughout the world of the Seventh-Day Adventist denomination, reported as of Sept. 30, 1945, had reached 562,412, of which 211,552 were in the United States and Canada. Evangelists and teachers were working in leading countries and island groups, carrying on in 468 languages and publishing religious literature in 185 of them. The denomination was operating 61 publishing centers, 184 sanitariums, hospitals, clinics, and treatment stations. It had a system of schools from elementary grades to and including college, with more than 136,500 students enrolled. Its theological seminary in Takoma Park, Washington, D. C. was providing advanced courses for ministers, teachers and foreign missionaries. Intensive courses in health and medical care were planned for non-medical missionary appointees to foreign fields.

A fully recognized medical college has annually a total of 75 physicians in its graduating class, in two divisions, one at Loma Linda, Calif. and the other at Los Angeles. An investment of $3,000,000 was authorized in 1945 to expand the Los Angeles division devoted to clinical training. Total funds raised for the overall program of the church for 1944 were $28,685,434 of which $22,612,119 came from the United States and Canada. Up to Oct. 31, 1945 the tithe and other contributions in those two countries were running almost 10 per cent above the corresponding period in 1944, which was taken to indicate an increase in giving in the North American territory for 1945. Literature sales in the world field for the Seventh-Day Adventists totaled $8,500,000 in 1944. Denominational appropriations for 1946 were set at $12,400,000 with $8,000,000 of it set aside for foreign work. Another $15,000,000 was to come from tithes and local funds.

From Dec. 1, 1944 to Dec. 1, 1945, 136 recruits were sent from North American bases to the foreign mission fields. Since 1900, 5,165 new missionaries had been sent out to foreign service. The training of ministers was continued at nine senior denominational colleges in the United States, and these courses were followed by two years of supervised field service known as the ministerial internship plan. The candidates then went on with their theological training. Up to the close of the Second World War the Seventh-Day Adventists maintained medical cadet training in colleges, secondary schools, and among young people's groups. The basis of the instruction, including clinical practice, was formulated with the Surgeon General's Office of the United States Army and conducted by personnel trained in military and medical science. The purpose was to train young people in the efficient care of sick and wounded. Between 12,000 and 13,000 of them thus served with the armed forces on every war front.

Faced with widespread destruction of church properties in war-ravaged lands, Seventh-Day Adventists, in common with other church groups, were planning at the end of 1945 for rehabilitation of churches and church institutions, the replacing of personnel in medical centers, schools, and mission organizations. During 1945 the Adventists provided $5,000,000 to start such work, which was to be expanded in 1946. A special "million dollar" rehabilitation offering was made in 1945 and a second was planned to be taken on Saturday, July 27, 1946.

ASSEMBLIES OF GOD

Reports, in many instances incomplete, rendered at the Twenty-first Biennial General Council of the Assemblies of God in September, 1945, in Springfield, Mo., indicated that 5,000 ordained ministers were serving in excess of the 226,705 members of the fellowship reported two years previously. Substantial growth was anticipated. Offerings for home missions in the biennium totaled $177,161, and in addition the sum of $60,000 was realized from profits of the Gospel Publishing House. The Council reported purchase of property at Hot Springs, Ark., for a children's home and the undertaking of a building project. An orphanage was being planned at Carlisle, Ky. Among needs foreseen were similar homes in other areas as well as one for retired ministers and missionaries. A total of $13,392 was given to aid conscientious objectors.

Foreign missionaries of this denomination, which came into being as the result of a spiritual revival primarily stimulated by a group of believers in Topeka, Kan., in 1901, were at work in 50 countries at the beginning of the war, though in six countries their programs were interrupted. The countries were Borneo, Malaya, Poland, Hungary, Yugoslavia, and Russia. Alaska was included in its mission fields, and plans were afoot for new work in the East Indies, including

Sumatra. The total of all missionary offerings for the two years was $2,293,519, an increase of 60 per cent.

The biennium saw a quarterly, *The Missionary Challenge,* launched with a circulation of 15,000. In the field of literature, the denominational *Pentecostal Evangel* had been increased to 116,000 weekly circulation. Plans were made for a Spanish publication and also for publication of Gospel literature in other foreign languages. Radio broadcasts were already being made in Spanish to five countries.

Projects in the publishing field totaled 25 with their combined circulation exceeding 1,000,000.

As objectives to be realized within three years, the following were proposed to the Council: enlargements of missionary staff to 1,000; organization of missionary prayer bands; establishment of new Gospel literature and distributing centers in all countries served; suggestion of daily 3-cent gifts to missions by all communicants; and increased use of radio broadcasts in missionary work.

NORTHERN BAPTISTS

The Northern Baptists launched a drive for $14,000,000 on Oct. 1, to cover worldwide post-war needs, the drive to end on April 30, 1947, coinciding with its statistical year. This was in addition to the denominational regular budget. The total budget for the two-year period, ending April 30, 1947, was $22,000,000. The work was divided into educational and spiritual in one grouping and in the second, financial and promotional needs. The regular unified budget for 1945-46 was to be lifted 10 per cent to $3,600,000, and by 1946-47 another lift was to bring it to $4,400,000. Quotas were set for constituent churches to contribute in an overall program. Over a six-year period, it was planned to increase the unified budget to $6,000,000 and keep it there.

The post-war fund was to be used in reconstruction, rehabilitation, and relief in China, Burma, Assam, and the Philippines. Allocations to Europe were also planned.

The 1944-45 total denominational budget was $5,025,000 and was reported oversubscribed by $100,000.

The denomination reported having 7,314 churches with 5,400 pastors and 1,570,446 members. There were 6,948 Sunday Schools. Total gifts to missions were $6,531,575; total to World Emergency Fund, $1,463,025; total local church expenditures were $24,944,484.

SOUTHERN BAPTISTS

Because of war conditions the annual sessions of the Southern Baptist Convention, usually held in the spring, were abandoned. The next convention meeting was set for May, 1946, at which plans called for the celebration of the centennial of the convention. Many Baptists in the South celebrated this anniversary locally in 1945. Objectives were to add 1,000,000 communicants and raise $20,000,000 for missions, the latter goal being more than achieved but only 300,000 baptisms being reported. This was the largest membership growth in their history, however.

Statistics for 1944 were: churches, 25,965; ministers, 24,011; members, 5,667,926; Sunday Schools, 24,626; pupils, 3,380,630; gifts, $76,599,420, of which $17,303,518 went to missions; value of church property, $259,740,714.

UNITED BRETHREN IN CHRIST

Approval was given in May, 1945 at the General Conference of the Church of the United Brethren in Christ of the proposal to merge with the Evangelical Church, which at its general conference in 1942 had approved the plan. Further ratification, however, was necessary on the part of the annual conference of both bodies. The United Brethren reported 20,580 conversions among its 28 district annual conferences and the receiving of 13,973 members on confession of faith in the year ended in October, 1945. Membership reported for 1944 in the United Brethren's communion was 433,480 in 2,748 churches. Local church expenses in the church year ended in October, 1945 were $6,470,676; for missionary, and benevolences the total was $1,925,488. Total contributions were $8,396,164.

CONGREGATIONAL CHRISTIAN CHURCHES

Resolutions adopted in October by the prudential committee of the American Board of Foreign Missions of the Congregational Christian Churches emphasized as a vital necessity the Christian task of world evangelism in order that "a world conscience shall be established as the standard of right and wrong for public procedure before it is too late." The committee in its statement said: "We find ourselves constrained to insist that no political nor economic order in itself can bring peace unless it be undergirded by a world conscience committed to the Christian ideal of human brotherhood and fair play." The statement and resolutions drawn up on the atomic bomb were the work of the board at its 136th annual meeting. One of the resolutions hailed "with hope the emergence of the United Nations Organization" from the Second World War. The Board is the oldest foreign missionary body in America.

At the beginning of October, it announced closing its fiscal year with a surplus of $22,247, having had receipts of $1,130,096, an increase of 10 per cent over the previous year. Contributions came from 5,800 churches who increased their gifts by 17.8 per cent; from 2,500 individual donors who gave a total of $100,860; legacies and matured conditional gifts and miscellaneous sources. Increased costs to support missionaries raised total expenditures to $1,112,969.

The office of the General Council of the denomination in New York City, which held no meeting in 1945, nevertheless published a report in July showing an increase of more than 20,000 church members in 1944, the highest gain in 20 years, bringing the total of communicants to 1,113,960. The preceding year's gain had been 16,000. There were 32 new churches organized and 48 merged or closed in the latest year. The number of clergymen withdrawn for war work, including chaplains, was 600.

Total benevolence gifts for 1944 were $3,350,919. The amount for home expenses was $17,467,525, an increase of $1,255,057. Funds of the denomination in 1944 amounted to $50,656,215. The General Council announced a drive for $4,500,000 for domestic and foreign post-war needs, to be raised in three years.

DISCIPLES OF CHRIST

Offerings from churches of the Disciples of Christ in the year ended June 30, 1945 under a unified promotion plan set up ten years before, totaled $1,875,649 and were $300,741 higher than the previous year, a gain of 19.1 per cent. This total exceeded by $999,271 the total in the first year. C. O. Hawley, director of the unified promotion of expanding services, who published the report, appealed for a "great religious passion" to move our nation and world to "build, not for themselves, but build in the light of the total human problem of the earth"; otherwise, he said, "history will repeat itself."

PROTESTANT EPISCOPAL CHURCH

The National Council of the Protestant Episcopal Church which conducts the business of the denomination between sessions of the Triennial General Convention, launched on May 1, 1945, a Reconstruction and Advance Fund drive with the twofold idea of: (1) The creation of a deep feeling of appreciation for the missionary work of the Church throughout the world and the relationship between that work and a lasting peace. (2) The raising of a minimum of $5,000,000 for reconstruction in areas overrun by the destruction of war—China, Japan, the Philippines—and advance in the war areas and other strategic centers, among Negroes in the United States, in Latin America and Liberia, and in the armed forces through the chaplains.

An every-member canvass was planned to take place in February, 1946 throughout all parishes in the United States. Particular emphasis was made upon the job of chaplains continuing in the days immediately following the end of the Second World War. Their ministry did not end with the fighting. A more difficult task was expected, in fact, in the first days of peace. Their ministry was defined as not being limited to meeting immediate needs and problems of fighting men. Episcopal chaplains in the armed forces were reported to have been decorated for valor, as well as being killed in action in a few cases or dying from other causes.

The number of baptized persons was 2,269,962. The total of communicants was 1,568,152 in 7,818 parishes and missions. There were 394,456 church school students with 46,336 teachers. The clergy number was 6,449. There were 209 ordinations; 68,868 confirmations; 86,410 baptisms.

Twelve new bishops were consecrated in 1945, three of whom were assigned to mission work. The latter were: R. H. Gooden, Panama Canal Zone; Bravid W. Harris, Liberia and Arthur B. Kinsolving, II, Arizona. The remaining nine were: Thomas H. Wright, East Carolina; William R. Moody, Lexington; Henry I. Louttit, South Florida, Suffragan; Alfred L. Banyard, New Jersey, Suffragan; Donald B. Aldrich, Michigan, Coadjutor; Conrad H. Gesner, South Dakota, Coadjutor; Frederick L. Barry, Albany, Coadjutor; C. Avery Mason, Dallas, Coadjutor; and John E. Hines, Texas, Coadjutor. The following bishops died in 1945: H. P. Almon Abbott, Lexington; Julius W. Atwood, retired, Arizona; and Frank E. Tourst, retired, Idaho.

The national council's department of promotion continued to utilize radio and motion pictures as media for proclaiming the Church's message. Its second professional sound motion picture, "Thy Will Be Done," was released in the autumn of 1945. The department also helped organize a Protestant film association. In radio, participation was continued in Columbia's Church of the Air, Mutual's Radio Chapel, and in local station programs. The denomination took part in national clothing drives and the sending of Christmas parcels to distressed peoples of Europe and Asia. Through the Presiding Bishop's Fund for World Relief, Episcopalians in 1945 gave more than $50,000 for the aid of afflicted peoples.

The next Triennial General Convention of the Protestant Episcopal Church, announced in 1945 to take place in October, 1946 in San Francisco, was changed to open on Sept. 10, 1946 in Philadelphia, Pa.

EVANGELICAL CHURCH

Bishop John S. Stamm, president of the Board of Publication of the Evangelical Church, in a foreword to the 1946 year book of the denomination, provided in proof form as the year 1945 closed, hailed the anticipated merger in 1946 of the Evangelical Church with the Church of the United Brethren in Christ. He announced that the 1946 year book of the Evangelical communion had been prepared "to further aid in this work." He wrote that both churches "shared in the much needed, but exacting, service of following the pioneers as they pushed the frontiers westward and northward, and the planting of the Church in the outposts in the United States and Canada. Both have extended their missionary services into many other lands." They had also developed activities in periodical publishing, in colleges, seminaries, and leadership training programs.

The general administrative council of the Evangelical group reported total receipts for 1944-5, ending the fiscal year on June 30, to be $265,587, or 102 per cent of an apportioned goal for general causes. The financial worth of the publishing interests of the group as of Aug. 31, 1945 was $1,061,166. There was a gross balance of $1,315,110 in the treasury. More than 600 beneficiaries were reported receiving pensions totaling $165,000 annually.

The total membership of churches of this communion as of Sept. 30, 1945 was 260,063. There were 1,952 congregations and 1,974 clergymen. The

Sunday School enrollment was 260,640. New members added were 16,434. Receipts for missions came to $821,991 and for benevolences, $700,394. The grand total for all purposes was $7,308,046. Local expenditures total was $3,488,583.

FRIENDS

The activities of the Five Years Meeting of the Friends in America as summed up in reports at sessions held in Richmond, Ind., Oct. 17-23, 1945, disclosed as the result of expansion in foreign and domestic fields a rise in disbursements of contributions from $375,603 in 1940 to $2,825,217 for the year 1944. Contributions other than money had a value of $264,188 in 1944 and included clothing, medicines, medical equipment, etc. The clothing committee which in 1940 had shipped 35 tons, reported 165 tons shipped the first seven months of 1945 and 92 more tons on hand for shipment. Such shipments came from contributions from sewing groups all over the country and from Friends' Centers in several large cities where clothing was cleaned, mended, and packed. Most shipping was done from Philadelphia and New York. The largest lots went to France, Sweden, Switzerland, or to places in the United States. Branches were opened in southern and northern California and in Chicago, and offices were set up in Seattle and Hawaii in aid of Japanese Americans.

The American Friends Board of Missions celebrated its fiftieth anniversary with the announcement in 1945 that there were 675 mission boards and agencies in North America, the British Isles, and Continental Europe. In most of the mission fields a decided increase in the size and strength of educational institutions was reported. In Africa the enrollment of students advanced from 17,000 to 24,000. In Jamaica, five educational institutions at Highgate were merged in the five-year period in one known as the Friends Educational Council, with the primary objective of vocational and craft work. Contributions for work in Mexico were increased fourfold.

Following the liberation of France, an international relief group, "Secours Quaker," was organized by Friends from America, Great Britain, and France. Delegations worked in Paris, Caen, Le Havre, Marseille, Toulouse, Montauban, and Perpignan, feeding children, distributing clothing, visiting prisons, and engaging in minor reconstruction and transportation projects. Quaker centers were cut off in Vienna, Amsterdam, Copenhagen, Berlin, and Paris at the outset of the war. Work was conducted among refugees, therefore, from Geneva and from new offices in Lisbon, North Africa, and Madrid, the latter office being kept open following the end of the Second World War. Considerable work was also being carried on in China, with members of the Society from America, Great Britain, China, New Zealand, and Canada cooperating. The Friends service committee sent more than $660,000 worth of milk, medicine, and vitamins for emergency relief to famine sufferers in India, using more than 300 Hindu, Moslem, and Christian agencies as distributors. The reports of operations of the various boards of the American Friends Five Years Meeting, partially under a reorganized united budget plan inaugurated April 1, 1944, disclosed that the Board of Missions collected $220,114 and paid out $222,503. Total receipts were $518,655 for all boards.

The American Friends Service Committee reported 1,734 men of its membership in civilian public service camps as conscientious objectors with a total cost at the time of the report of $1,920,000 for their support.

LUTHERAN CHURCHES

A report of Lutheran accomplishments for 1945 gave little statistical information concerning the churches themselves. In fact, attention was turned to services being performed abroad, and most leaders were busy performing such services. Of primary importance to them was restoration of relations with Lutherans in Europe, whence they had sprung under the Protestant Reformation. American leaders went overseas in March visiting bishops in the Scandinavian countries and the headquarters of the World Council of Churches in Geneva. Dr. Sylvester C. Michelfelder, of Toledo, O., took up residence in Geneva in midsummer and remained to act as representative of the American section of the Lutheran World Convention to the World Council of Churches. A fund of $2,500,000 was raised by Lutherans in America in 1945, a large part of which contributed to European relief. A goal of $10,000,000 was set for 1946-47.

Archbishop Erling Eidem, Primate of the State Lutheran Church of Sweden, was named in December as president of the executive committee of the Lutheran World Convention, being elected at a meeting in Copenhagen, Denmark. Organized in 1923, the Lutheran World Convention federated Lutheran bodies in 28 countries, embracing most of the 80,000,000 Lutherans throughout the world. The committee's meeting in Copenhagen was the first since 1939 and was attended by churchmen from Denmark, Sweden, Norway, Finland, and America. Dr. Michelfelder was elected executive secretary, succeeding Dr. Hans Lilje, of Germany, underground leader of the German Student Christians, who had held the office since 1937. Archbishop Eidem succeeded Bishop August Marahrens of Hanover, Germany, who had been president since 1935 and whose resignation followed charges by Lutheran leaders that he had failed to oppose the Nazis.

Because of the work abroad in Europe closer relations were growing among Lutherans at home in America wherever they worked on common projects. This trend became apparent in January, 1945, when the National Lutheran Council, representing eight Lutheran bodies, adopted a new constitution which pledged its 3,500,000 members to cooperate in activities never before attempted together. The Lutheran Synod of Missouri, Ohio, and other states, representing 1,500,000 Lutherans, was working with the others through 1945.

New service centers from which to serve men and women in the armed forces were set up in Paris, Manila, Chungking, and Honolulu. Assistance was being given through Army and Navy chaplains and through 75 of these centers, where, of course, work diminished toward the end of 1945, but a new type of ministry was evolving because of the needs of returning service personnel, particularly the wounded. Under the National Lutheran Council's Division of Welfare, chaplains were obtained for veterans' hospitals to the full extent of the Lutherans' quota as allotted by the Federal Government.

The Church's efforts to follow the migrating of workers and families to war industry areas resulted in an emergency ministry to 41 war housing centers by V-J Day. Organizing of 24 regional Lutheran Home Mission committees was completed, and a rural church life program was set up on a cooperative basis. The Lutheran Commission for War Prisoners distributed more than 750,000 books to them in 1945, including Bibles, Testaments, hymn books, and catechisms. With the addition of welfare centers in four cities in 1945, the Lutheran family welfare societies were serving in 25 cities. Pastoral work was being carried on in 99 veterans' hospitals and on 155 college campuses. A devotional program of over 27 radio stations in 19 states was inaugurated. Slide films showing conditions in many parts of the world were also issued to help dramatize an appeal for funds to help.

More than 2,000,000 tons of clothing and bedding was asked of Lutherans in America in November. A commission of three leaders was sent to Europe in that month to confer with Lutherans there; they were Dr. Ralph H. Long, executive director of the National Lutheran Council; Dr. Franklin Clark Fry, president of the United Lutheran Church in America; and Dr. J. A. Aasgaard, president of the Norwegian Lutheran Church of America.

METHODISTS

The Methodists in 1945 gave their principal energies to raising $25,000,000 for relief and reconstruction in war-torn countries, and in the first four months of 1945 had pledges and cash totaling $27,500,000, of which $22,000,000 was paid in before the end of the year. Preliminary work had been done in the fall of 1944 on this drive, which was authorized by the General Methodist Conference which met in the spring of 1944 in quadrennial session at Kansas City, Mo. Secondary emphasis was given to an evangelistic campaign for 1,000,000 new members of the Methodist Church; also to arouse from indifference some 1,125,000 inactive church members. Training schools in evangelism were organized in 33 episcopal areas, special preaching missions were undertaken, and home visitations made. A weekly periodical was undertaken to promote the evangelistic drive as a "New Life Movement," and a tabloid for Methodist young people was also started in Nashville, Tenn. Somewhat overlapping the $25,000,000 relief and reconstruction drive, which was established as a phase of a "Crusade for Christ," the Committee on Overseas Relief raised $673,296, of which $216,619 went to China relief.

Active members in the Methodist Church, according to 1944 figures, numbered 8,046,129. The Woman's Society of Christian Service had 1,161,389 members and raised $7,017,113 for its program of home and foreign missions and other services. The total raised by the church at large for ministerial support was $42,035,097. A total of $25,508,723 was paid on church debts, buildings, and improvements, which was more than $4,000,000 higher than the year previous. There were 21,104 pastoral charges and 41,067 preaching stations. Indebtedness on buildings decreased from $37,498,263 to $25,587,960. The total value of churches, equipment, and parsonages was $731,403,538.

Contributions to benevolences were $21,598,525. The Church paid $116,223,876 for all purposes. The Board of Publication had its largest year with sales of $8,315,232. Its circulation of church school leaflets and story papers increased to 89,000,000.

Changes reported in the Council of Bishops included the retirement on reaching necessary age, of Brenton T. Badley, Delhi, India; John M. Springer, Elizabethville, Belgian Congo, Arthur F. Wesley was elected to succeed Bishop Juan E. Gattinoni of Buenos Aires, Argentina, and John A. Subhan, a Mohammedan convert, was elected to succeed Bishop Badley in India. Bishop G. Bromley Oxnam, who had succeeded Francis J. McConnell on his retirement in 1944 from the Methodist New York Area, represented American Protestants at the enthronement of the new Archbishop of Canterbury in April. He then visited the Continent, and the Mediterranean and North Africa-Middle East war theaters on an official mission to chaplains. In November, Bishop Oxnam was one of three representatives of Protestantism in America to Protestants in Germany.

The Methodist merger of May, 1939, which had been stubbornly opposed by a minority of dissidents and was upheld in the courts, nevertheless resulted in the organizing by 46 congregations of the former Methodist Church, South, into the Southern Methodist Church, with 22 ministers.

The Council of Bishops of the Methodist Church, meeting early in December, 1945 in Buck Hill Falls, Pa., opposed peacetime compulsory military training, sending their statement to President Truman, the Secretaries of War and Navy, and chairmen of Congressional committees concerned. The bishops regarded universal compulsory military training in peacetime as a betrayal of our historic democratic institutions and a possible step toward bureaucratic fascism and a threat to the moral life of youth. The National Methodist Student Conference, meeting for five days starting Dec. 28, 1945 at the University of Illinois, with 1,370 students delegated from 200 colleges, in a poll on this question, voted 828 to

47 against compulsory military training.

The Methodist Committee on Chaplains reported that 132 Methodist chaplains had received 162 decorations for valorous conduct in the Second World War. Nine were killed in action and 12 died from other causes. More than 1,650 Methodist ministers served as chaplains in the armed forces in the war.

CHURCH OF THE NAZARENE

This denomination sent out 40 missionaries, principally to Africa, India, China, and Latin America. A total of 132 new churches was organized in 1945. The seven colleges of the denomination, six in the United States and one in Canada, were declared free of debt in 1945, and several had begun expanded building programs. A central graduate seminary, known as the Nazarene Theological Seminary, first of the denomination, was established in Kansas City, Mo., headquarters of the denomination. The seminary opened Sept. 19 with 61 graduate students preparing for the ministry. The denomination also was conducting in 1945, over 40 radio stations, an international religious broadcast. Although complete figures were not tabulated, per capita giving for the year averaged more than $60 a member.

PRESBYTERIAN CHURCH, U. S. A.

Meeting under war conditions with reduced attendance because of restrictions placed upon conventions by the Office of Defense Transportation, the 157th General Assembly of the Presbyterian Church in the U. S. A. assembled in Minneapolis, Minn., May 24 through May 30, 1945. Some 9,000 churches in the United States were represented. Approval was given to raising a fund of $27,000,000 for relief and rehabilitation in the post-war period at home and abroad. The budget adopted had the following as minimum foreign needs: European relief and reconstruction, $3,654,500; Asia, $1,575,000; continuing emergency needs for missionaries $1,240,000; temporary emergency reserve and relief reserve for Europe and Asia, $362,115, making a total of $15,471,615 for needs abroad. In America for administration by the Board of National Missions, the goal set was $3,144,780: for education, including aid to 39 Presbyterian colleges, $1,004,390; Board of Pensions, $3,680,000; camp and church activities, $2,107,178; for the American Bible Society, $246,280; administration and promotion, $837,930; and reserve, $507,827. The entire fund was to be raised in from two to two and a half years from June 1, 1945. The Stated Clerk reported memberships on confession of faith had kept pace with the previous year, running between 93,000 and 100,000. The denomination's total members, reported by the Presbyterian War-Time Service Commission, in 1945, was 2,161,872. The commission reported that gifts in an annual collection taken the previous year, totaling, for wartime service work, $1,432,905, had helped cover increased wartime costs in transporting 99 missionaries to their fields of service and 136 returning on furlough, as well as repatriating 70 missionaries from the Philippines. At least 21 more repatriations were expected in 1945-46. By the end of November, more than 50 were ready to take passage for foreign fields. A total of 316 grants were also made in aid to refugees, parish workers, pastors, civilian and industrial chaplains, student pastors and internes in war industry areas at home, through 84 presbyteries and 26 synods. Of these grants, 34 were for emergency buildings and improvements.

In May, 1945 the denomination's chaplains in service numbered 725, in addition to 12 who had died on active duty and 30 others discharged for disability or other reasons. The chaplains' group represented 25 per cent of all active pastors in this Presbyterian communion who were under 50 years of age.

The General Council of the denomination reported receipts of $14,990 for aid of conscientious objectors in civilian public service camps, seeing little hope of normal support of these men by the Federal Government.

Dr. Hugh Thomson Kerr, former pastor of Shadyside Presbyterian Church, Pittsburgh, Pa., returned in November from three months in Europe representing the Presbyterian Restoration Fund, and reported on damages and needs abroad. He reported that "the Church is the only thing left in Europe with any solidarity" and that "the most urgent need today in France and other war-devastated countries is moral stability." Dr. Kerr also was a representative of the World Council of Churches while abroad.

PRESBYTERIAN CHURCH, U. S.

This division of the Presbyterian denomination, covering the area of the Southern States, had in its 17 synods in 1945, subdivided into 87 presbyteries, a total of 3,513 churches, 2,586 ministers, and 580,369 members. During the year, 20,714 members were received on profession of faith and 25,954 by certificate. Baptisms were 21,594. The contributions for current expenses were $5,721,307; for pastors' salaries, $3,811,606; for building expenses, $3,443,950; and for benevolences, $5,656,925. The total for all purposes was $18,633,788, an increase over preceding year of $2,600,000. The total per capita gift was $32.10.

The eighty-fifth General Assembly was held in Montreat, N. C., in May, 1945, with 365 present. Actions taken included instructions to the Committee on Cooperation and Union to continue "to explore and search in suitable ways a means of bringing into one body all branches of our Presbyterian family"; specifically to "endeavor to perfect as soon as practicable the plan for reunion of the Presbyterian Church in the U. S. A. with the Presbyterian Church in the U. S." A budget of $30,000 was set for work of the radio committee. The communion had 151 chaplains in the Army and 119 in the Navy. Plans were made for the rehabilitation of mission work in the Orient and for promoting home missions, particularly in areas where there had been sudden shifts in population. Rev. Thomas K. Young, D.D., of Idlewild Church, Memphis, Tenn., was elected moderator. The 1946 General Assembly was to meet May 23, in Montreat, N. C.

UNITED PRESBYTERIAN CHURCH

This communion had under consideration in 1945 a proposed merger with the Reformed Church in America. The financial goal it had for worldwide Christian work was $2,310,000. It had 198,759 members, 844 congregations, 922 ministers, and received in contributions a total of $6,230,350 or an average of $31.35 per member. Its moderator for the ensuing year is Rev. James M. Ferguson of Bellevue, Pa. Its clerk is Dr. O. H. Milligan, 805 Taylor Avenue, Avalon, Pittsburgh, Pa.

REFORMED CHURCH IN AMERICA

The annual report of the General Synod of the Reformed Church in America in June, 1945, showed 742 churches, 892 ministers and 173,975 members. The amount raised for benevolences was $1,209,518 and for congregational expenses was $4,773,776. The synod voted at its annual meeting to open a new mission field in Ethiopia and adopted a budget of $300,000 for relief and rehabilitation. Hope was expressed for merging with the United Presbyterian Church in 1947.

CHRISTIAN REFORMED CHURCH

This denomination recorded 130,000 members in 1945, with 311 ministers, 345 congregations, and had 22 chaplains in the armed forces. Several radio broadcasts were being carried on local stations. Total receipts for missions for the year ended Dec. 31, 1944 was $203,482. The denomination, through a committee for Netherlands War Relief, reported $125,000 received up to June 6, 1945. An annual year book was scheduled to be published in February, 1946, obtainable from the Christian Reformed Publishing House, 47 South Jefferson Street, Grand Rapids, Mich.

SALVATION ARMY

The Salvation Army carried religious and social services to 225,000,000 servicemen and women on 26 fighting fronts during the war. War urgency needs were met by 3,000 Red Shield Clubs, which were often improvised huts set up on beachheads, in jungles, and at desert outposts. In the United States, Salvation Army clubs and those operated through the United Service Organization, provided personal services, including mending clothes, wrapping and mailing packages, checking valuables, emergency transportation, financial and legal aid, sleeping accommodations, voice recordings, and home hospitality. Salvationists visited 595,000 wounded and sick service men in hospitals. Up to November, 1945, the Salvation Army had 1,000 mobile canteens which traveled a distance equivalent to four times around the world. Many were equipped with library, radio set, film projector, record player, and facilities to serve 4,600 men on a trip. There were 23 such units attached to the invasion army in France. An auxiliary service to the global land (Red Shield) canteens was provided in Australia by a motor launch which met sea and land convoys and visited remote outposts on inland rivers.

Among projects carried out were: a home in France for children whose parents could not be found; a refugee boys' home and "Warphanage" in China; soldiers' and sailors' rest homes in South America and the Middle East; homes for evacuees, demolition crews, and moving units in England after bombings; grocery stores in Canada for stranded families in war-boom towns; dining rooms serving meals to war workers' children; restaurants in Belgium for refugees; hostess houses throughout the United States for families and friends of enlisted men.

Evangelical work on the fighting fronts was adapted to circumstances and location. Religious guidance and consolation were given to all individuals requesting them, regardless of creed, race, or color. The year 1945 was marked in the United States by a national spiritual campaign; intensification of youth activities; and increased war service to veterans in readjusting to civilian life. Coordination was directed by Commissioner Donald McMillan, national secretary, New York City.

The United States, for Salvation Army Administrative purposes, is divided into four territories, each headed by a commissioner as territorial commander. These are in turn separated into divisions, with divisional commanders. There was in 1945 a total of 1,381 Salvation Army Corps in all principal cities.

The Salvation Army operated 234 social welfare units, such as social service centers, hotels, and lodgings for men in these cities, and had 65 homes and hospitals for women. In many rural areas, the Army's work was also carried on. The Army had 2,000 trucks and 109 salvage centers in the United States, cooperating in the United Nations drive for clothing for Europe. Its first shipment of new clothing to reach France left in May, having been collected in London from the United States, Canada, Australia, and other countries. The first Salvation Army European relief consignment was sent the same month from Britain to Holland, with 12 rehabilitation officers, and included in the convoy, a mobile chapel. Many local organizations in Hawaii liberally aided the Salvation Army in its work in those islands, following Pearl Harbor.

CHRISTIAN SCIENCE

More than 1,000 Christian Science wartime workers were busy in 1945 under the guidance of the Camp Welfare Committee of the Mother Church, the First Church of Christ, Scientist, in Boston, meeting spiritual and material needs of men and women in the armed forces at home and abroad. Wherever possible, Christian Science services were conducted. There were 25 chaplains in the Army and one in the Navy. Four received bronze stars for meritorious service. The Christian Science churches maintained reading rooms and supplied Christian Science literature to rest rooms and recreation centers for members of the armed forces, including service women.

A Christian Science relief committee supplied money and clothing to sufferers in the British Isles, Europe, and Russia, without regard to race, color, or creed. This was in addition to thousands of knitted garments supplied to men and women in the armed forces of the United Nations. With the end of the hostilities in Europe, a Christian Science Post-war Relief Committee was organized.

The Mother Church prepared transcribed radio programs used over more than 100 radio stations in the United States and Canada. The *Christian Science Monitor,* an international daily newspaper, maintained a large staff of correspondents throughout the world, including all war theaters. The *Monitor* was honored with a gold medal for outstanding service in fire-prevention. It also received the Helms Athletic Foundation award for noteworthy achievement in sports. It won first honorable mention in the over-50,000 circulation group of dailies in the annual exhibit of newspaper typography under the auspices of N. W. Ayer and Son, Inc.

The Christian Science Board of Directors announced the opening on May 28, 1945 of a new department of the executive offices of the Mother Church, to be known as the Sunday School Activities Division.

UNITARIANS

Two new churches were started by Unitarians in the year ended May 1, 1945. As of April 1, the Unitarian Service Committee was carrying on its program in 15 countries and on five continents, the total staff numbering 112, having started the previous Oct. 1, on a budget of $500,000 and working up to $750,000, by the end of the church year. It prepared, with the end of hostilities, to do post-war work. The collection of 9,000 pounds monthly of clothing for shipment to Europe was continued throughout the year. From an active list of 375 ministers, 36 were serving as chaplains with the armed forces and 18 others were engaged in full-time war service. The president of the American Unitarian Youth Council was selected in 1945 as one of 25 delegates from the United States to attend a World Youth Conference in London in October.

THE ROMAN CATHOLIC CHURCH

By HENRY P. LEFEBURE
NATIONAL CATHOLIC WELFARE CONFERENCE

STATISTICS

Membership of the Catholic Church in the United States in 1945 totaled 23,963,671, according to the figures given by the *Official Catholic Directory.* A record total of 14,302 Catholic parishes are in operation, with 13,463 of them having resident pastors. There are, in addition, 5,048 chapels and 5,164 mission churches.

There are now 160 members of the American Hierarchy presiding over 100 dioceses and 22 archdioceses. These also include for statistical purposes as American dioceses: The Vicariate-Apostolic of Alaska; Honolulu, Hawaii; the Abbatia Nullius of Belmont Abbey, N.C., as well as the Pittsburgh (Greek Rite) and the Ukrainian Greek Catholic Dioceses, but not the Military Ordinariate of the Army and Navy.

The number of ordained clergymen —38,451—is the highest on record. There are 25,567 diocesan priests and 12,884 religious order priests, an increase of 702 over the 1944 figures. Among professed religious, the number of Sisters has increased by 4,092 to a total of 138,079, and the number of Brothers by 432 to 6,594.

Educational institutions have increased, despite war conditions, by 231 to a total of 11,075. Elementary parish school pupils have increased by 32,803 to a total of 2,029,012. Parish high school enrollments are 278,619, an increase of more than 10 per cent over 1944. The number of seminarians has risen by 707 to a total of 21,523; but there are 5,280 fewer college students than one year ago, now totaling 92,426.

A total of 84,908 converts entered the Church during the year. Infant baptisms numbered 710,648, and deaths increased by 2,456 to 264,747.

The total number of American youths under Catholic instruction is estimated at 3,205,804, an increase of 167,948 over the 1944 figures.

Twenty new institutions bring the total of Catholic general hospitals to 685, while the former bed capacity of 69,537 has been increased by 17,634 or 25 per cent in one year, to the record total of 87,171.

The number of patients treated annually in general hospitals totals 3,290,821 and in the 101 special hospitals and sanitoria, 56,687.

There are 48,329 children in 373 Catholic orphanages and infant asylums and 18,925 children in foster homes. As a means of providing religious education for Catholic children in public schools, 8,053 religious vacation schools are operated with a total enrollment of 683,484 students.

WAR EMERGENCY ORGANIZATIONS

The first national organizations to meet war emergencies were established by the Catholic Hierarchy at the Annual General Meeting of November, 1940. These were the National Catholic Community Service, designed to serve members of our armed forces and production workers in new war-created communities, and the Bishops' War Emergency and Relief Committee, whose chief function would be to raise funds for relief of human needs in war-stricken countries abroad. Later, in February, 1943, the Administrative Board of the National Catholic Welfare Conference established War Relief Services-National Catholic Welfare Conference actually to administer a war relief program.

NATIONAL CATHOLIC COMMUNITY SERVICE

During the year, the National Catholic Community Service, a member agency of the USO, showed flexibility in remaining keyed to successive changes in the war tempo, and in rapid adjustment to a more specialized program as the needs of returning servicemen and women, the wounded, and those disabled, mentally and physically, presented themselves with their problems of transition from military to civilian life. Allied problems connected with the vast army of workers in war plants, many of which ceased production during this period, were handled by the Women's Division of NCCS, the migrant workers receiving assistance either in returning to their original homes or in finding new employment and more adequate housing in the town in which they had worked.

NCCS continued immediate service to returnees in work adjacent to military hospitals and near established military concentrations.

Program material included religious, recreational, and educational activities. A monthly total of 154,000 volunteers assisted in operations with an average of 1,164,000 hours of service per month. The peak number of NCCS Clubs was reached in July 1944, with 492 USO operations.

Material gathered by the department of research and statistics will form the basis for an authentic history of this service of the Church in the Second World War. Part of that history will be the effort made for Negro servicemen and women, which continued in the period under review to receive careful attention. During 1945, NCCS conducted 56 Negro operations and employed the services of 93 trained Negro leaders.

A record of NCCS independent operations, financed by the Bishops' War Emergency and Relief Committee, here and abroad, is particularly interesting. Service clubs operated successfully in Rome, Naples, Florence, Heliopolis (near Cairo), Milan, and Paris. More recently, the work extended into Manila.

BISHOPS' WAR EMERGENCY AND RELIEF COMMITTEE

Funds raised by the Bishops' War Emergency and Relief Committee in Catholic churches throughout the United States were used to provide general relief to war victims, prisoners, refugees, and homeless. The majority of the distribution was made through the Vatican among all distressed peoples on the basis of the greatest need. Included was general relief in Luxembourg, Belgium, Italy, the Orient, France, Greece, Holland, North Africa, Malta, and the Balkan countries.

Aid was given to refugees both in the United States and abroad, as well as to American prisoners of war in Europe and the Orient, and to provide Catholic services for enemy prisoners in the United States.

Assistance was given to Catholic chaplains in the armed forces in the form of religious equipment, supplies, and religious articles necessary to the fulfillment of their duties. Servicemen's clubs overseas were supported in Italy, Egypt, France, and the Philippines.

The Church in Mexico also was aided by grants given towards the operation of Montezuma Seminary, located near Las Vegas, N. M., where 350 Mexican candidates for the priesthood are being educated.

WORK OF THE NATIONAL CATHOLIC WELFARE CONFERENCE WAR RELIEF SERVICES

A vast work of mobilizing Catholic efforts on behalf of the war-stricken, as well as the actual task of distribution of relief, has been accomplished by War Relief Services-National Catholic Welfare Conference, a participating agency of the National War Fund.

Since the beginning of operations on Aug. 1, 1943, a contribution in the value of $42,728,542 has been made to war sufferers in 42 countries. A large part of this contribution is made up of 43,077,000 pounds of clothing and foodstuffs having a money value of approximately $35,000,000, collected through the Catholic churches of the United States.

An average of one ship every 10 days has left the United States since 1943 for the areas of need. Among the supplies, the quantity of milk, both powdered and fluid, shipped abroad by War Relief Services was sufficient to provide 1,340,025 children with an eight-ounce glass daily for one month. There was enough cod liver oil to provide 102,000 infants with the necessary minimum requirements of Vitamins A and D each day for six months.

Six million nine hundred eight thousand articles of clothing and bedding and 356,535 pairs of shoes, together with materials sufficient for the repair of 120,000 pairs of shoes were shipped, also surgical instruments and accessories sufficient to equip 256 operating rooms, material sufficient to stock 3,675 community first aid stations, and an amount of soap equivalent to 2,535,626 cakes of the household size.

Transportation equipment from a motor cycle to truck trailers shipped is sufficient to keep more than 200 tons of relief materials on the move at one time.

Over 10,000,000 educational, occupational, recreational, and religious articles have been sent to American, Italian, German, and Japanese prisoners of war.

Large relief programs are being operated in Belgium, France, Holland, Italy, the Philippines, China, Poland, for the Poles outside of Poland, and displaced persons in Germany and Austria. Special programs are financed for refugees in the United States, a welfare program for children, and the aged and infirm in England, a program for relief of students in Switzerland, and a rehabilitation program for 1,470 Polish refugees in Mexico.

Five projects were concluded during the year: civilian relief programs in North Africa and Malta, civilian relief for Italians in Egypt, and large programs for refugees in Portugal and Spain.

By using indigenous agencies of charity, War Relief Services has kept its administration staff at home and abroad to a minimum of 68 persons, and at least 22,000 volunteers are engaged in the work, principally abroad.

Seven gifts-in-kind campaigns were conducted during the year, with the generous cooperation of the Bishops of the United States. In October, War Relief Services began shipments to Poland. The organization started relief work in Austria in December, 1945. An extensive program is being carried out with displaced persons in Germany and Austria. This work was started in August, 1945 and will continue during 1946. A staff of over 50 persons is engaged in this work.

In addition to the figures of collections given above, 115 dioceses cooperated in the campaign of food for the War Stricken of Europe and the Far East, Dec. 9-16, 1945. A goal of 20,000,000 cans of foodstuffs was set and exceeded. The cans were gifts of members of 15,000 parishes in all parts of the country.

His Holiness Pius XII sent a special message imparting his apostolic benediction to workers in the campaign in the following words: "Receiving daily as the common father piteous appeals from every corner of the earth for help and succour, and knowing, therefore, only too well the depths and extent of the desolation caused by the war throughout the world, it is with deep consolation and with a heart overflowing with affection that we bestow our Apostolic benediction on this latest evidence of the zeal and charity of our beloved children in the United States in the Christlike efforts to bring relief in ever increasing measure to the innocent victims of the war."

ANNUAL GENERAL MEETING OF THE BISHOPS

On Nov. 14, 1945, 110 members of the Hierarchy in the United States assembled at the Catholic University in Washington, D.C. for their 1945 general meeting, and continued in session for three days. The Bishops passed a resolution on compulsory military training, asking first that our government "should explore the possibility of having military conscription abolished in all countries," but adding that if a wide extension of military training is found necessary for present adequate defense of our nation, then "(1) voluntary enlistments in the armed forces should be stimulated as much as possible, to provide our first line of defense; (2) any period of enforced training should be integrated with normal school life; and (3) the War and Navy Departments should work with recognized moral leadership to correct certain policies and attitudes which have wrought grave moral damage to great numbers of young people in the armed services during the past five years."

At the close of their meeting the Bishops issued a statement, "Between War and Peace," which was signed in their names by the Administrative Board of the National Catholic Welfare Conference. The statement called for a renewal of the ideal of peace outlined in the Atlantic Charter and expressed disappointment in the pattern for peace emerging from the conferences of the United States, Russia, and Great Britain. The Bishops asked for a sound United Nations Organization which would be not merely a virtual alliance for the great powers in the Security Council, but a sound institutional organization of the international community. They called attention to the disregard of our pledge to the Polish people, of the absorption by force of the Baltic countries, of the shocking news leaking out from Slovakia, Slovenia, Croatia, and other southeastern European countries.

The statement concluded with a prayer that God in His Blessed Providence help us to be the vigorous champion of democratic freedom and the generous friend of the needy and oppressed throughout the world.

The Bishops' meeting also reviewed reports of the various N.C.W.C. departments and elected members to the Administrative Board of the National Catholic Welfare Conference and the episcopal committees on the American Board of Catholic Missions, the Propagation of the Faith, the Confraternity of Christian Doctrine, the National Organization for Decent Literature, the North American College, and Motion Pictures.

NEW N.C.W.C. ADMINISTRATIVE BOARD

New members elected to the N.C.W.C. Board were the Most Rev. Richard J. Cushing, Archbishop of Boston, and Most Rev. John Mark Gannon, Bishop of Erie. Other members re-elected included: The Most Rev. Archbishops John J. Mitty of San Francisco, John Gregory Murray of St. Paul, Joseph F. Rummel of New Orleans, James H. Ryan of Omaha, Francis J. Spellman of New York, and Samuel A. Stritch of Chicago; and the Most Rev. Bishops Karl J. Alter of Toledo and John F. Noll of Fort Wayne.

At the meeting of the newly elected Administrative Board, following the general sessions, Archbishop Stritch was named to serve as chairman.

The report of the Executive Department to the Bishops' Meeting observed that in two important ways, the Church in the United States felt the impact of international developments: one, in the matter of relief and rehabilitation of devastated countries and their peoples, millions of whom are our brethren in the Faith: the other in the sense of responsibility for the establishment of a peace of justice and charity based on the principles laid down by our Holy Father, Pope Pius XII.

Among the variety and multiplicity of other matters in which interest of the Executive Department was enlisted during the year and on which, in some instances, appropriate enquiry and representation was made, the following are a few examples: repeated attacks from Moscow on the Vatican, the Catholic press in the United States, etc.; immigration and transportation of 40 Polish boys in India destined for seminary studies in the United States; the fate of the Church in Poland, Slovakia, and Lithuania; displaced Lithuanians in France, Ukrainians in Germany, Croatians in Italy, Slovenes in Austria; the education program of the allies in Germany; reparations for the Church in the Philippines; alleged interference with German Bishops' Meeting at Fulda; deportation of enemy aliens rounded up in Latin America and detained in the United States; the fate of Korean Catholics; international Catholic relief organization; disposal of surplus property abroad, especially where Communities of the United States have missions; alleged mistreatment of prisoners of war in the United States; and inter-American Catholic education organization.

CATHOLIC EDUCATION PROJECTS

During the year, the attention of the Department of Education was largely directed to various educational problems that are an aftermath of the war or are concerned with post-war plans for schools and colleges. The revival of the issue of Federal aid to education made this subject an important field of activity. The Department expressed opposition to the Thomas-Hill bill, which would grant aid only to public elementary and secondary schools. Testimony of the Department was offered, however, in behalf of the Mead-Aiken bill, supported by the American Federation of Labor, which would include aid in its provisions to the children of all schools, public and non-public.

Continued interest was given to the various steps that were taken in this country toward the formation of an International Office for Education. The Department participated in the many discussions that finally resulted in the London Conference on this subject.

The Department continued to cooperate with the Treasury Department in war bond and stamp sales in Catholic schools. A recent Treasury statement, cited in the report, showed more than $65,000,000 in sales in 92 dioceses during the 1944-45 school year.

ACTIVITIES OF THE CATHOLIC PRESS

Through the N.C.W.C. *News Service,* readers of the Catholic press had made available to them the most authoritative and detailed reports on the news events which centered on the Vatican, occupied close-up seats in San Francisco where a corps of correspondents and leading thinkers of a half-score of countries gave special coverage, traveled with the Allied forces as they plunged eastward to the defeat of Germany, stood close at hand for the capitulation of the Nazis and its after effects, followed events of Catholic interest as more and more of the Pacific area became liberated, and followed through the eyes and ears of experts the emergence of France from the yoke of Nazi domination.

In addition to these, the Catholic press mirrored for its readers in the last year thousands of happenings in all parts of the world that had high news importance, dramatic impact, and poignant human interest.

SOCIAL ACTION

During the year, the N.C.W.C. Department of Social Action carried on widespread activities to acquaint the nation with the undertakings of the San Francisco Conference, Dumbarton Oaks Proposals, and Bretton Woods Agreements.

Four pamphlets and six committee statements, dealing mainly with international peace, were issued by the Catholic Association for International Peace, an auxiliary of the Department, while a new edition of *Pope Pius XII and Peace* was prepared by a Department member.

A Seminar on the Spanish Speaking people of the Southwest, held in Denver, brought together priests, sisters, laymen, and laywomen from the four archdioceses of the Southwest and West. Intensive assistance to the Archbishops and Bishops of that area was given in working out a general program for the religious, social, and economic welfare of the Spanish Speaking, and the Department continues as consultant in the work.

Drafts of a program of post-war reconstruction were drawn up and discussed with heads of employers' organizations, labor officials, government representatives, and persons learned in Catholic social teaching.

The ninth Institute on Industry was held in cooperation with the National Council of Catholic Women, with a special course given to representatives of the NCCW Social Action Committee.

Besides the work done with the Spanish Speaking groups, work was done with the Negro group by assistance given to the Federated Colored Catholics in plans for its new work, attending meetings of the Interracial Council, National Council of Negro Women, and the Committee to Make Permanent the F.E.P.C., etc.

At present there are approximately 60 Catholic labor schools in operation, and plans are being made to open additional projects. Several dioceses have coordinated their work in this field under a diocesan labor institute.

Favorable progress was made in the work of the Family Life Bureau during the year, with the Family Life Conference at the Catholic University of America as its outstanding activity.

LAY ORGANIZATIONS PROGRESS

At the close of the year, the Catholic Radio Hour, produced by the National Council of Catholic Men, was being carried by 98 NBC stations in mainland United States and Hawaii. Audience mail received during the period came to 101,411 pieces. The Hour of Faith was carried by 37 ABC stations, and audience mail totaled 4,611 pieces.

During the year, N.C.C.M.'s Narberth Information Articles were published weekly, in free space, by 199 secular newspapers, having a combined circulation of more than 1,000,000. The articles were also distributed direct-by-mail, in pamphlet form, by a number of N.C.C.M. affiliates.

CATHOLIC WOMEN'S ORGANIZATIONS

In its effort to unite the Catholic

women of the United States, which was begun 25 years ago, the National Council of Catholic Women now counts a total organization of 73 diocesan councils, 19 national organizations, and seven state organizations, comprising 4,300 local societies.

The influence of this united strength has been brought to bear particularly upon the fields of International Relations, Social Action, and War Relief. Study clubs, public forums, radio addresses and lectures on the Papal Peace Program were sponsored by NCCW and participated in by women's groups throughout the country. The Council distributed 140,000 pieces of literature to acquaint the Catholic women of the nation with the need for studying the proposed world organization in the light of the Papal Peace Program, and for stimulating public discussion of these topics.

CONFRATERNITY OF CHRISTIAN DOCTRINE

Emphasis during the year in the Confraternity of Christian Doctrine was on the spiritual and technical preparation of all members of the parish C.C.D. executive boards in order that the priest directors may have informed, qualified assistants in the development of the parish program.

A National Street Preaching Institute, under the direction of the Apostolate to the non-Catholic section of the Confraternity of Christian Doctrine, was held at Our Lady of the Ozarks College, Carthage, Mo., July 5-20, 1945, with marked success. During the two weeks, 27 priests representing 10 dioceses took part in the demonstration work. There is now in preparation a *Manual of Street Preaching*.

THE EASTERN CHURCHES

By E. R. Hardy, Jr.,
Berkeley Divinity School

GREEK (HELLENIC) ORTHODOX CHURCH

In the winter of 1944-5, Archbishop Athenagoras undertook a visitation of the Greek communities in the Pacific States, which have been without episcopal supervision since the death of Bishop Eirinaios of San Francisco in May, 1944. At the same time, Bishop Gerasimos of Chicago visited the communities in the South, officiating at the blessing of the waters at Tarpon Springs, Fla., on the Feast of the Epiphany, Jan. 6, 1945. Bishop Germanos Polizoides continued to assist the Archbishop in New York, the Middle West, and the South, and Bishop Athenagoras in New England, where he heads the Seminary at Pomfret, Conn. Early in 1945, news was received of the death of Archbishop Alexander, who from 1922-1930 was the first Archbishop of the Greek Church in America; a native of Nicomedia in Asia Minor, since 1931 he had been Metropolitan of Corfu.

The Greek Church in America is divided into six districts for the promotion of its educational and missionary work—five in North America and one comprising South America. During the year, conferences were held in several of these districts for the teachers in Greek religious schools; the New England district met in Boston in February, the New York district at Astoria in March, the Western district at Sacramento, Calif., in May, the Southern district at Spartanburg, S. C., in June. It is planned to organize an Apostolate of clergy especially devoted to missionary work in each of these districts.

The Greek communities cooperated, as they have before, in the drives for War Loans, the Red Cross, and Greek War Relief, besides raising $5,000 in the annual collection at Easter for the spiritual head of their Church, the Patriarch of Constantinople. The Bishops officiated at memorial services for President Roosevelt in various Greek Churches on the Sunday after his death, and doxologies were held in the Greek Orthodox parishes for V-E and V-J Days. A prominent layman from Greece, who visited the United States in the early summer, was Prof. Hamilcar Alivisatos of the University of Athens Faculty of Theology. He spoke in the Cathedral in New York and in other Greek churches, as well as presenting the needs of the Church in Greece to the representatives of the World Council of Churches and other bodies.

RUSSIAN ORTHODOX CHURCH

The most conspicuous event in the Russian Orthodox Church was the opening of negotiations, as yet inconclusive, for the re-establishment of normal relations with the Church in Russia. Bishop Alexei, formerly of Alaska, and the Very Rev. Joseph Dzvonchik were sent as a delegation to the Sobor of the Russian Church at Moscow, but were unable to arrive until after the meeting. A Patriarchal Ukase of Feb. 16, 1945 offered terms for the reunion, which involved the holding of an American Sobor for the election of a new Metropolitan, subject to approval at Moscow, called for renunciation by the American Church of political activities against the USSR, and left uncertain the degree of autonomy which might be granted to the Church in America. These terms were rejected as unsatisfactory by the Bishops' Council at Chicago on May 22-24; an explanatory statement issued by the Metropolitan Council in July stressed the desire of the Russian Orthodox Church in America to remain an American Church; as such it is naturally nonpolitical, but can not restrict the freedom of thought and speech of its members. It may be noted that, under present conditions, there is probably more sympathy with the USSR than opposition to it in Russian parishes.

In the fall, Archbishop Alexei of Rostov and Yaroslavl arrived in America as representative of the Patriarch of Moscow and conferred with Metropolitan Theophilus and others. A second meeting of the Bishops' Council in December came to no further conclusions, and further negotiations may await the next All-American Sobor of clergy and laity. Meanwhile the old Russian Cathedral in New York, long in the hands of a schismatic group, has been handed over by its present occupier to Archbishop Alexei as representing the mother church of Russia.

The Russian Church is proud of the record of its four chaplains (three in the Army and one in the Navy), who, as the only Orthodox chaplains in the armed forces, have ministered to servicemen and women of all branches of the Orthodox Church. Three of them are recent graduates of St. Vladimir's Theological Seminary, now in New York, which celebrated in the fall the fortieth anniversary of its original foundation in Minneapolis. On Oct. 4 the Church lost one of its older leaders; Archbishop Arseny, known to a previous generation as a distinguished preacher in Russia and America, and formerly Bishop of Winnipeg and of Detroit, died at St. Tikhon's Monastery, South Canaan, Pa. An interesting episode of the summer was the restoration to the old church at Fort Ross, Calif. (now restored as a historic monument) of the bell brought by Russian settlers in 1812, and for many years used by the Petaluma Fire Department.

SERBIAN ORTHODOX CHURCHES

Bishop Dionisie of the Serbian Orthodox Church has established his official headquarters at St. Sava's Cathedral in New York. On June 10, at the first anniversary of its consecration as an Orthodox church, the mortgage on this building was burned. Bishop Irenei of Dalmatia has come to this country, and is residing at the Cathedral. During the year, the Serbian Church began the publication of a church paper in English; among the activities recorded in it is the organization at the Monastery at Libertyville, Ill., of a summer camp for children from Serbian parishes in the Chicago area.

ROMANIAN AND BULGARIAN CHURCHES

The Romanian and Bulgarian Churches in America are under temporary administrations in the absence of their Bishops in Europe—the Romanian Bishop Polycarp having been unable to return since attending the Romanian Synod in 1939, and the Bulgarian Bishop Andrei having recently left for a visit to Bulgaria. An interesting episode in November was the blessing by the Romanian priest in New York (Rev. Vasile Hategan) of an iron lung being sent to Bucharest by the National Foundation for Infantile Paralysis.

ALBANIAN PARISHES

Most of the Albanian parishes in America are now united under the jurisdiction of Bishop Fan Noli, who since his ordination in 1908 has been a leading figure in Albanian-American life, and is responsible for the translation of the Orthodox ritual into Albanian, now used in Albania as well as here. Under present conditions, the relation of the American parishes to the Albanian Synod is still unsettled.

ORTHODOX CHURCHES ABROAD

On Jan. 31 and Feb. 2, 1945, the All-Russian Sobor met for the election of a Patriarch of Moscow in succession to the late Patriarch Sergius. The Patriarchs of Antioch, Alexandria, and Jerusalem were present, also representatives of Constantinople and of the Serbian Church, making this perhaps the most widely representative assembly of the Orthodox Church since the 17th century. Metropolitan Alexei, the acting Patriarch, was unanimously elected, and was installed on the following Sunday, Feb. 4; born in 1878, he had been a teacher of theology, and since 1921 Vicar-Bishop and then Metropolitan at Leningrad. Metropolitan Benjamin, the Patriarchal Exarch for America, who took a prominent part in the Sobor, proposed that the Orthodox Church might form a central committee for its common interests. This did not meet with favor, but another proposal of general concern made at the Sobor was carried into effect; this was a formula for ending the schism which has existed between the Bulgarian and Greek Churches since 1873, on the basis that the Bulgarian Church should express regret for its breach with the Patriarchate of Constantinople, and in turn be granted the status of an autocephalous Church. This was done on Feb. 22, and the office of Bulgarian Exarch has been filled by Metropolitan Stefan of Sofia.

The Russian Church has been enabled, owing to the friendlier relations which now exist between it and the Soviet Government, to revive and reorganize many aspects of its life. Many churches and monasteries have been reopened, a Theological School has been established at Moscow, episcopal sees have been filled, and most of the leaders of the schismatic groups which broke away after the Revolution have returned to the Church. In the spring Patriarch Alexei visited the Orthodox Churches of the Levant, whose Patriarchs had come to Moscow; and in June a delegation under Metropolitan Nikolai of Krutitsk went to England, returning the visit of the Archbishop of York to the late Patriarch Sergius in 1943.

In Greece, Metropolitan Damaskinos of Athens served throughout the year in the difficult and responsible position of Regent. The Churches of Bulgaria and Romania (the latter under Patriarch Nicodim) are important factors in the reconstruction of their respective nations. In Yugoslavia, the leaders of the Church were largely adherents of the Serbian royalist party, and Patriarch Gavrilo and others are remaining abroad; but the Church is a factor of undeniable historical and social importance in Serbian life; its position under Marshal Tito's regime will probably approximate that which it now occupies in Russia. The Orthodox diocese in Carpatho-Russia, formerly attached to the Serbian Church, has now been transferred to the Russian Church, as a natural consequence of the political transfer of that area to the Soviet Union.

OTHER EASTERN CHURCHES

The Armenian Prelacy of North America was represented at the Armenian National Congress in Etchmiadzin in June by its Prelate, the Very Rev. Diran Nersoyan. Georg VI Chorekjian was elected and installed as Catholicos of All Armenians, and greeted as such by the other chief Armenian prelates (of Cilicia, Constantinople, and Jerusalem). One of his first acts was to consecrate ten new Bishops for the Armenian Church, one of them being Nersoyan, who has now returned to this country as Bishop. He is making arrangements for the supply of clergy for the Armenian parishes, and other needs of the Armenian Church.

Mar Shimun XXIII, Patriarch of the East and Catholicos of the Assyrians, celebrated his 25th anniversary in this office at Chicago on July 1. A Solemn Mass at the Assyrian Church in Chicago was followed by a dinner presided over by the pastor of the Assyrian Church in Flint, Mich. Mar Shimun is continuing his visit to the Assyrian congregations in America, and is planning for the formation of clergy in this country.

JUDAISM AND JEWISH COMMUNAL AFFAIRS

By Harry Schneiderman*

and
Julius B. Maller
Co-Editor, *American Jewish Year Book*

GENERAL

The climactic events of 1945 left their impact upon the American Jewish community. With regard to the war effort, some 600,000 Jews served in the nation's armed forces, and countless others served in shops and laboratories developing and improving essential war equipment.

The collapse of Nazi Germany brought to light the full scope of the catastrophe which had befallen the Jews of Europe. Of a pre-war population of 6,000,000 in continental Europe, outside the Soviet Union, only one out of five Jews remained alive. Horrified by the revelation of Nazi atrocities, American Jews strengthened their efforts to succor the remnants of Jewish communities overseas.

Among the major problems as yet unsolved are the protection of the stateless, the repatriation of the displaced, the rehabilitation of those unwilling or unable to return to their countries of previous residence, the reuniting of families, the care of orphans, the extension of emergency relief to the proverty-stricken, and the combating of a resurgent anti-Semitism in liberated countries. A problem of particular concern is that of Jewish orphans who found shelter in non-Jewish religious institutions during the Nazi occupation.

In an attempt to alleviate the most pressing of these problems, Jewish relief agencies in the United States intensified their activities during the year, and Jewish communal organizations increased in number and membership. Jewish leaders joined with others in considering the problems of post-war reconstruction and the establishment of a just and lasting peace and submitting their conclusions to the United Nations Security Conference at San Francisco in April.

STATISTICS

Jews in the United States number approximately 4,770,000, according to the Census of Religious Bodies, 1937, based on records of Jewish Congregations, immigration data, and reports from local communities throughout the country. These reports disclose that, while Jews are widely distributed, residing in every state in the union, they are concentrated primarily in urban areas, consequently reflecting in their choice of occupation the pattern typical of urban sections of the country.

---

* Grateful acknowledgment is made to Mrs. Geraldine Rosenfield for assistance in the preparation of this review.

The largest proportion of Jews lives in the northeastern section of the country; the proportional variation of Jews to total population ranges from 16.7 per cent in New York State to 0.21 per cent in North Carolina. Jews constitute 3.7 per cent of the total population of the United States and nearly 11 per cent of the population in cities of 100,000 or over.

RELIGIOUS AND EDUCATIONAL ACTIVITIES

Spurred on by the catastrophic extinction of Jewish centers of learning abroad and by the need of the American community for religious direction and informed leadership, theological seminaries intensified and expanded their programs in several directions.

The first of these programs was that initiated in February 1945 by the Jewish Theological Seminary of America (Conservative) at the instance of the Dean of its Teachers' Institute, Dr. Mordecai M. Kaplan. Broadened into a "University of Judaism," the Seminary was envisaged as a center for the training of leaders in all phases of Jewish religious, communal and cultural activity.

A similar program was launched in May by the Rabbi Isaac Elchanan Theological Seminary and Yeshivah College (Orthodox). Dr. Samuel Belkin, president of the institution, announced plans to develop a Graduate School of Community Administration and Social Research, a Graduate School of Education and a School for Adult Education. These, together with the present five schools associated in the institution, would constitute a Jewish University, the first to be established outside of Palestine. In December 1945, Yeshivah University, as the school is now known, was granted a charter by the State Board of Regents.

The Reform seminaries, Hebrew Union College and the Jewish Institute of Religion, embarked on campaigns for the enlargement of their programs.

All four seminaries inaugurated special facilities for rabbinic schooling for students from Latin America, where growing communities are turning increasingly to the United States for guidance in ordering their religious and social affairs.

CONSERVATIVE JUDAISM

The three principal bodies of Conservative Judaism—the United Synagogue, Jewish Theological Seminary, and Rabbinical Assembly—worked in closer unison during the year than ever before by instituting a joint fund-raising campaign and by setting up a liaison committee of the heads of these three organizations to cooperate in program planning. Plans have been made to expand the Joint Commission on Jewish Education into a Department of Education, with a permanent educational director and a staff and budget to enable it to produce texts and other educational materials needed in Conservative religious schools. Preliminary steps were taken to create a Rabbinical Pension Fund.

The text of a Sabbath and Festival Prayer Book was completed by the Joint Prayer Book Commission. A Metropolitan Council of the United Synagogue was established in the New York area for the purpose of developing a program for the diversified religious activities of young people and adults, and especially for veterans.

The Women's League of the United Synagogue of America also centered its program on the needs of the returning veteran. The National Federation of Jewish Men's Clubs, which reported a growth of almost 100 per cent during the year, organized new regional groups in New York and Boston, in addition to those already existing in Philadelphia and Pittsburgh. A highly significant project undertaken by this group was the National Layman's Institute, the second session of which was held June 19-24, 1945. Here some 50 laymen met for a concentrated period of Jewish study and training for leadership in the Jewish community.

The Jewish Theological Seminary of America presented a series of coast-to-coast radio programs under the general title "The Eternal Light," comprising dramatic presentations of the history of noted synagogues and biographies of outstanding Jews. The Institute for Religious Studies, established at the Seminary in 1938 for ministers and theological students of all faiths, to examine the "common background of all western religions and the problems facing the leaders in all phases of community life," opened another branch in Boston on Jan. 19, 1945.

The Jewish Reconstructionist Foundation whose purpose is the advancement of Judaism as a religious civilization celebrated the tenth anniversary of its periodical, *The Reconstructionist,* in February 1945, with a dinner to the founder of the movement, Dr. Mordecai M. Kaplan. The Foundation published its own Sabbath Prayer Book and issued a variety of pamphlets for use by study groups and a musical cantata. The Reconstructionist Fellowship, organized in January 1944 to bring together leaders and members of study groups throughout the country, held its second meeting on Feb. 22, 1945.

The Social Justice Committee of the Rabbinical Assembly of America went on record in June 1945, at hearings before the House Military Affairs Committee, as opposing enactment during the war of legislation requiring peacetime conscription and military training.

ORTHODOX JUDAISM

In a move to meet the special religious needs of Jews surviving the Nazi holocaust in Europe, the Union of Orthodox Rabbis of the United States and Canada inaugurated an Emergency Religious Relief and Rehabilitation Department with these aims: to rescue Jewish orphans and refugee children; to repair and reconstruct houses of worship; to restore Jewish cemeteries; to rebuild and reorganize parochial schools; to reunite separated families; to restore Jewish communal institutions and reorganize communal supervision of dietary observances; to provide Torah scrolls, prayer books, and ritual objects; to send American Orthodox Rabbis to Europe on "field duty"; and to convene a world congress of rabbis to consider these and similar problems and effect a permanent international rabbinic organization to further Jewish religious interests. In May, the Union launched a campaign to implement this extensive program.

Among the new projects initiated by the Union of Orthodox Jewish Congregations of America is the Orthodox Union Veterans' Council which is designed to advise congregations on on how to carry out a five-point program for veteran rehabilitation through the synagogue.

In the Southeast a new religious organization made its appearance. The Southeastern Synagogue Conference, comprising 15 orthodox congregations in Alabama, Georgia, Florida, and Tennessee, a women's division, and a Rabbinical Authority Committee, was formally inaugurated with the adoption of by-laws, at a meeting in Birmingham, Alabama, Feb. 2-4. The expressed purpose of the group is to "strengthen traditional Judaism in the Southeast."

Expansion was also the keynote of the year's activity in the Sephardic Community. The Central Sephardic Jewish Community of America announced on March 27 the formation of a "World Federation of Sephardic Communities," with headquarters in New York City. The purpose of this new body is to intensify active participation of Sephardic Jews in world Jewish affairs, and to coordinate their religious, cultural, educational, and economic efforts.

REFORM JUDAISM

The Reform group continued to be troubled by internal dissension over its relation to the Zionist movement and to the "nationalist" ideology. Several congregations sharply criticized the Union of American Hebrew Congregations and the Central Conference of American Rabbis for retreating from their former anti-Zionist attitude, and continued to demand the withdrawal of these bodies from the pro-Zionist American Jewish Conference. The Union, however, rejected such criticism as unjustified, and declined to submit to these demands, at the same time emphasizing its neutrality on the moot issue of a Jewish commonwealth in Palestine.

The Union of American Hebrew Congregations inaugurated a program of Interfaith Institutes on Judaism, in cooperation with the Central Conference of American Rabbis. Organized in local communities for ministers of all faiths, these institutes were planned to acquaint religious leaders with the beliefs, practices, and history of Judaism, and to emphasize the common origins and ideals inherent in both Judaism and Christianity. Branches were established in 83 congregations, and more than 2,500 adult students were enrolled in courses in Jewish history, religion, literature, and present-day problems.

The Central Conference of American Rabbis issued a newly revised edition of the *Union Prayer Book,* Volume Two, which contains the services for the High Holidays. On the occasion of Race Relations Week, the Commission on Justice and Peace of the Central Conference of American Rabbis issued a proclamation expressing the sense of brotherhood of all Jews with members of all races and pledging to the colored races support in their struggle "for the equality which is their right in all spheres of human endeavor." A number of Reform congregations invited Negro preachers to occupy their pulpits on the Sabbath preceding Lincoln's Birthday.

UNITED ACTION

The Synagogue Council of America, comprising lay and rabbinic representatives of all three Jewish religious groups, advised all congregations in the country to hold special services of mourning during the week following the tragic death of President Roosevelt on April 12, 1945, and again in celebration of the announcements of victory in Europe and in the Pacific.

The Synagogue Council adopted a positive role in connection with the San Francisco Conference. In a memorandum to the United States Delegation it recommended practical steps for the achievement of an international bill of rights, justice to the Jews, the outlawing of racial and religious incitement, and universal disarmament.

Another project of the Council was the creation of a special committee on the Synagogue and Labor, headed by William B. Herlands, former Commissioner of Investigations of New York City. This committee will work for the improvement of relations between organized labor and Jewish religious institutions, and will formulate specific projects whereby religion and labor can cooperate "to promote economic, social and political democracy and to deepen the religious spirit among working men."

COMMUNITY ORGANIZATION

Increased national income, general employment plus wartime restrictions on consumption, and favorable tax exemptions were factors conducive to increased generosity in philanthropic contributions for wartime and continuing welfare needs. The American Red Cross reached higher goals in 1944 and 1945; the National War Fund, which included the USO and overseas relief, and local community and war chests continued to raise large sums. Twenty-two Jewish welfare funds were included in war chests, the same number as in previous years.

There has been a continued strengthening of local organizations for common Jewish purposes and activities. Federations, welfare funds, and community councils have demonstrated their essential value in developing cooperation among the varied Jewish groups. At present, there are 268 Jewish national organizations, which may be classified as religious (exclusive of congregational membership), fraternal, philanthropic and welfare, Zionist and pro-Palestine, educational and cultural, defense, professional, war veterans, and a variety of others.

Changing social and educational factors in American life, added to the sharp reduction in new immigration, are bringing about a greater homogeneity, especially in the smaller communities, and the Jewish population is becoming preponderantly native-born in the adult as well as the youth groups. While cultural and religious differences remain, differences arising out of variations in national origin and economic classes are constantly being attenuated.

WELFARE

The interest in serving the Jewish community and the need for developing programs and agencies geared to current conditions stimulated the raising of capital funds in large and intermediate-sized cities. These funds are intended primarily to furnish, improve, and extend adequate medical and health services; provide for the care of the aged and the chronically ill; and establish centers for the development of Jewish education, culture, and recreation. In some of the more advanced communities, casework services formerly limited to marginal groups are being made available to the whole Jewish population. One aspect of this development was the beginning of a fee service for economically self-sustaining families by agencies such as the New York Jewish Social Service Association, which formerly dealt principally with the economically dependent group.

NATIONAL EFFORTS

Efforts to counteract discrimination in employment were carried on cooperatively during this period by the Coordinating Committee of Jewish Organizations Dealing with Employment Discrimination in War Activities, a project for national and local cooperation, sponsored by the Jewish Occupational Council. This effort resulted in securing support from all major Jewish agencies for the Fair Employment Practices Commission established as a Federal war-time measure. There was general agreement that the FEPC should become a permanent function of the Government in the post-war period. There has been similar agreement and support of the Ives-Quinn Bill enacted into law by the New York State Legislature, which outlaws discrimination in employment on account of race, color, or creed. The Coordinating Committee has been absorbed as a regular function of the National Community Relations Advisory Council, a group set up for the coordination of the work of national and local Jewish agencies engaged in community relations activities.

The Council of Jewish Federations and Welfare Funds, the Jewish Welfare Board, the Jewish Occupational Council, and the American Association for Jewish Education all expanded their programs during the year. The JWB continued its large-scale program of service to veterans directly and through the United Service Organizations, in addition to its regular program of service to its cultural-recreational member agencies. Through its Bureau of War Records it made progress in compiling the record of Jewish contribution to the war effort.

CONTRIBUTION TO THE WAR EFFORT

The Jewish Welfare Board, an agency whose major concern in recent years has been the wartime needs of men and women in the armed forces, continued to minister to the cultural, educational, religious and recreational needs of the fighting men. Its representatives worked along with chaplains on battlefronts, in rear sectors, and in every part of the world where soldiers and sailors lived and fought.

The Bureau of War Records of the JWB is at present attempting to ascertain the number and ratio of Jewish men and women in the United States armed forces and the current figures on casualties and awards. On December 1945, incomplete data already collected by the Bureau indicated that some 600,000 Jewish men and women served in the armed forces.

In addition to this number, which would be sufficient to man 40 divisions, more than 50 per cent of the American rabbinate volunteered for the chaplaincy, with half of their number serving overseas. One third of the Jewish physicians of all ages were in uniform; 60 per cent of those under 45 were in the armed forces. Combat casualties among Jewish men and women numbered 22,042, while 29,004 awards were received by some 15,000 Jewish soldiers and sailors. One received the highest award of the nation, the Congressional Medal of Honor, and 76 earned the second highest award, the Army Distinguished Service Cross and the Navy Cross.

On the basis of initial returns in June 1945 from 17 Jewish Communities, it was disclosed that 34 per cent of the male refugees in the 18-44 age group were in military service. This is identical with the corresponding proportion of service men in the age group for the general male population of the country.

VETERANS SERVICE PROGRAMS

As an accredited agency of the Veterans Administration, the Jewish Welfare Board has long maintained direct services to veterans in hospitals and in dealing with their personal and family problems, including assistance in furthering claims for governmental benefits. The JWB has developed and is implementing a program for assisting returning servicemen in their readjustment through the JWB directly, through Jewish community centers, and through veterans service committees organized in local communities. The program sponsored by the JWB is for both disabled and able-bodied veterans. For disabled veterans the Board carries on a national program under its own direction; for able-bodied veterans it serves primarily to stimulate and coordinate local community organizations for veterans programs. The JWB has helped to organize local veterans service committees in 50 of the largest Jewish communities throughout the country. It is also represented on the National Committee on Service to Veterans which was formed, under the auspices of the National Social Work Council, to coordinate the planning of non-governmental national welfare agencies dealing specifically with the able-bodied ex-service group.

INTERFAITH ACTIVITY

Jewish groups have always welcomed united action on the part of all religious faiths for the attainment of a common goal, the welfare of the entire community. During the year, Jewish, Catholic and Protestant leaders attempted in various ways to point up the dangers of intolerance in this country, and have warned of a post-war emergence of anti-Semitism, anti-Catholicism, and anti-Protestantism.

The year's outstanding manifestation of interfaith unity was the unanimous demand of the Protestant, Catholic, and Jewish faiths for incorporation of a human rights provision in the United Nations Charter. Undoubtedly one of the most impressive gestures ever made by the interfaith movement in America was its insistence that the Charter contain an International Bill of Rights and provide for a commission "to protect and further the rights and liberties of the individual, and of racial, religious, and cultural groups, especially those uprooted by war or oppression."

A study prepared by the interfaith committee in April 1945 listed these demands among ten recommendations urged upon the San Francisco Conference. Bases for the study included the Pattern of Peace issued by 146 leaders of the three major faiths in October 1943, and more recent statements of the Roman Catholic hierarchy, the Federal Council of Churches of Christ in America, the Synagogue Council of America, and the Cleveland Church Study Conference on a just and durable peace.

The Conference adopted the interfaith recommendation and wrote into its charter the provision that "the Economic and Social Council shall set up a commission for the promotion of human rights."

Alive to the problem of post-war employment discrimination, religious leaders continued during the year to make strong appeals for Federal legislation to set up a permanent Fair Employment Practices Commission. Passage by the New York State Legislature of the Ives-Quinn bill to outlaw discrimination in employment was hailed as a victory for representatives of the three faiths who had helped bring about its enactment. This was believed to be the first time in the legislative history of New York State that Protestant, Catholic and Jewish groups had unanimously backed a bill.

The National Conference of Christians and Jews reported the extension of its educational program into new regions and cities and intensified work in schools, colleges, churches, civic agencies, and military training camps. The Conference now has about 300 Round Tables, which function throughout the year, and special committees in about 3,000 communities, which function during Brotherhood Week, Religious Book Week, and on other occasions.

Growth of the Interfaith movement during the year was marked by the formation in April 1945 of the Newark (N. J.) Council for Inter-Group Action to coordinate the activities of several goodwill organizations, and the establishment in September of the Trenton (N. J.) Committee for Interracial Unity, which will cooperate in promoting better relations among all minority religions and racial groups.

GROUP TENSIONS

Immediately after the cessation of hostilities, disruptive American groups, which had agitated for anti-Semitic measures before the war, emerged from temporary hiding to resume divisive and bigoted programs. An attempt to coordinate these groups was made by former Senator Robert R. Reynolds who, in January 1945, established an American Nationalist Party. Organized on the basis of secret units or cells of ten members, it was reminiscent of the Nazi party in its infancy. Despite strenuous efforts on the part of anti-Semitic leaders to swell the membership of the Party, opposition was strong enough to cause dissolution of the American Nationalist Party in September of the same year.

Several of Reynolds' "lieutenants" in the political venture continued, after the dissolution of the party, to agitate in their own groups. Gerald L. K. Smith divided his rabble-rousing among several organizations keyed to attract such specific groups as veterans and youth.

The so-called "mothers" groups continued to propagate anti-Semitic doctrines, concentrating on mothers who had lost sons in the service. The Ku Klux Klan reappeared on the scene with new plans for dividing the country into antagonistic groups. Several individuals in the public eye fomented during the year, in their speeches and writings, anti-Jewish sentiment.

COUNTERACTION TO BIGOTRY

Recent studies of attitudes toward minority groups in America reveal a heightening of all forms of racial tension. Recognizing that the economic and social dislocations of the wartime period are continuing in the post-war world, many organizations have embarked upon programs to eliminate or alleviate group antagonisms. More and more, government, labor, industrial, educational, women's and religious groups have introduced programs for the eradication of anti-Semitism and other expressions of intolerance.

JEWISH GROUPS

Jewish groups, whose function is the safeguarding of civil rights of members of that faith, continued their unremitting opposition to all forms of anti-Semitism. A noteworthy innovation to the work of counteracting anti-Semitism is the trend toward scientific analysis of the causes of prejudice. The American Jewish Committee, organized in 1906, has set up a Scientific Research Department in the field of anti-Semitism, whose purpose is to test and analyze methods of combating prejudice in order to determine the most effective weapons against anti-Jewish activities. The American Jewish Congress, organized in 1922, created a Commission on Community Interrelations whose function is to ascertain the basic causes of anti-Semitism in real life situations and to suggest methods for their eradication.

The Anti-Defamation League of the B'nai B'rith, which for over 30 years has been working to eliminate defamation of Jews, during the year carried out its program through a speakers' bureau, books and pamphlets, radio broadcasts, and in cooperation with communities and civic groups. It also turned its attention to cooperation with labor groups and to discrimination in schools and employment.

The Jewish Labor Committee is concentrating its efforts in the fight against anti-Semitism among American workers, and is cooperating with the CIO and AFL in the sponsorship of anti-discrimination legislation.

COMMUNITY EFFORTS

During the war many communities felt the need for organized efforts to relieve antagonisms which arose among citizens of differing racial and religious strains. Mayors' and governors' committees to study group prejudices and to foster good will and cooperation have been set up in defense production centers and areas of mixed racial groups. Other citizens concerned with the preservation of the democratic American tradition have organized professional, civic, or social groups to deal with similar problems. Among such organizations the most recent are the Council for Civic Unity of San Francisco; the Independent Citizens Committee of the Arts, Sciences and Professions, with headquarters in New York City; and the League for National Unity in New York City.

USE OF THE PRINTED WORD

Members of the New York State Publishers Association, on Jan. 23, 1945, pledged the use of newspaper resources to improve racial and religious relations. A program adopted at the Association's annual meeting included the fight against bigotry as one of its aims. In support of this aim, *The New York Times* refused to accept an advertisement containing the words "selected clientele," and was upheld by a New York State Supreme Court decision which ruled that the use of the two words was an indirect means to hide discrimination.

The John C. Winston Co. announced early in 1945 a decision to eliminate all "name-calling" words from its dictionaries, in the belief that words of questionable usage contribute to the perpetuation of racial, religious and ethnic antipathies.

OVERSEAS RELIEF AND REHABILITATION

Jewish agencies throughout the world accelerated their programs for the relief of the destitute Jews in Europe. American Jewish relief groups cooperated with government agencies, private relief organizations of other faiths, and the International Red Cross in their tremendous program of relief and rehabilitation.

The United Jewish Appeal was reconstituted to continue its work of the past seven years as the single fund-raising instrument for the support of the overseas relief program of the Joint Distribution Committee, the Palestine settlement projects of the constituent organizations of the United Palestine Appeal, and the refugee adjustment program in the United States of the National Refugee Service. American Jews rallied speedily to the cause of European aid, and by June 15 the United Jewish Appeal had received, as a result of pledges made for the year 1944, the unprecedented sum of $25,108,091.90 in contributions.

The increasing gravity of the situation of the stateless and displaced Jews, many of whom are still living in internment camps, necessitated an expansion of the activities of the three beneficiaries of the United Jewish Appeal as the year drew to a close. In October the three national chairmen of the U.J.A. called upon American communities to make an unprecedented effort "to avert tragic suffering and despair among those who have survived the cruelest persecution in the history of mankind."

The program of the Joint Distribution Committee, largest overseas relief organization of American Jews, concerned itself immediately after the liberation of the European countries with emergency needs for food, clothing, and medical supplies. For the first five months of 1945, the sum of $11,884,000, exceeding the entire expenditures for 1943 and more than half the total for 1944, was appropriated for this work. A major project of the J.D.C. was the setting up of homes for thousands of orphaned children, many of whom had been sheltered in Christian homes or convents.

By October 1945, the J.D.C. had 35 welfare workers operating in the former concentration camps in Germany in the American and British zones, and ten more were being added to the staff. The J.D.C. is shipping supplies also to Jewish survivors in Poland, France, Italy, Rumania, Hungary, and Bulgaria. In the Orient, provision was made for the relief of 12,000 refugees in Shanghai who were freed from Japanese rule. In the ten-month period ended April 30, 1945 the J.D.C. allocated $1,293,145 for the rescue and transportation of Jewish refugees to Palestine.

The rising influx of refugees has increased the demands upon the United Palestine Appeal, whose funds contribute to the support of the work of the Jewish Agency in Palestine, and its most pressing concerns now are housing, medical care, training, transportation, and expansion of 300 existing agricultural centers.

The National Refugee Service is increasing its assistance to refugees in the United States formerly employed in defense work. It also is assuming the major responsibility for the 923 refugees released from the emergency shelter in Oswego, N. Y.

In the months following V-E day new problems arose that called for an even wider extension of the services of the Hebrew Sheltering and Immigrant Aid Society of America (HIAS), which for over a generation has been working in the field of immigrant and emigrant aid. Victory in Europe brought a flood of new inquiries from relatives anxious to help their kin. HIAS has been called upon to serve and assist in the preparation of sponsor-affidavits on behalf of refugees residing in France, Belgium, Italy, and other countries. After the Nazi collapse, HIAS, in conjunction with the Jewish Colonization Association, opened nine offices in France to serve refugees with greater efficiency at points where they concentrated. Food parcels are sent to France by American relatives of the refugees there. Under United States government license, HIAS acts as forwarding agent for American residents to send financial assistance to Switzerland and Rumania, an extension of the money-forwarding services of HIAS during the war.

The American ORT Federation, principal fund-raising agent of the World ORT Union for rehabilitation through vocational training, adopted for 1945 a budget of $1,550,000. ORT work in Europe during the year concentrated on re-establishing its program of vocational training. In seven principal French cities, courses were introduced for the training of men, women, and children in such trades as radio mechanics, dressmaking, applied chemistry, beauty culture, machine assembly, millinery and tailoring. In addition, the ORT re-established its agricultural program, with four separate projects in various sections of France. An important phase of ORT work has been the supplying of tools for those who are trained to do useful work but lack the equipment. In Switzerland ORT has more than 100 training units functioning, including more than 30 different trades.

The American OSE Committee, a Jewish health agency, during the year was able to start health services in the devastated European countries by sending medical teams of physicians, nurses, and welfare personnel to Rumania, Yugoslavia, Bulgaria, and Czechoslovakia, and by shipping to needy areas quantities of medical supplies and equipment. Besides administering first aid, these medical teams also carry on surveys of health conditions and of possibilities for assistance and relief.

PROPOSALS FOR RESCUE

Efforts to save the Jews of Europe from starvation and disease received a sudden jolt when the report of Earl C. Harrison, American representative on the Intergovernmental Committee on Refugees, was made public in September. The Harrison report criticized the United States military government's administration of displaced persons' camps, charging that "as matters now stand we appear to be treating the Jews as the Nazis treated them except that we do not exterminate them." Harrison recommended several measures for the alleviation of conditions, particularly the opening of Palestine to displaced Jews and the admission to this country under existing immigration laws of a "reasonable" number of these Jews.

Calling attention to the Harrison report, President Truman directed General Eisenhower to remedy conditions affecting displaced persons in the American zone of Germany and Austria. Subsequently, General Eisenhower assured the President that efforts had been made to improve the conditions of the displaced persons.

At the same time President Truman called the attention of British Prime Minister Clement Attlee to Harrison's report, and recommended that 100,000 certificates be granted for the immigration of German and Austrian Jews into Palestine. Reaction among Jewish groups to the President's suggestion was divided. Zionist groups felt that it was an evasion of the basic issue of a Jewish commonwealth in Palestine. Representatives of the American Jewish Committee expressed their approval and support of the plan.

Later in the year the American Jewish Committee wrote to Secretary of State James F. Byrnes, demonstrating the feasibility of issuing a greater number of United States visas to stateless and unrepatriable European Jews. Shortly thereafter, on Dec. 22, President Truman issued a special directive to the Secretaries of State and War, the Attorney General, the War Shipping Administrator, the Director General of UNRRA, and the Surgeon General of the Public Health Service, ordering them to mobilize their various departments and agencies to facilitate immigration into the United States at the maximum rate of 3,900 persons (of all faiths) a month.

President Truman also authorized the entry into this country, under the existing quota, of the 923 refugees living at the Fort Ontario Emergency Refugee Shelter since August 1944.

WAR REFUGEE BOARD

The War Refugee Board, which served, in rescue activities, as intermediary between the Government and Jewish agencies, terminated its activities on Sept. 15. William O'Dwyer, now Mayor of New York City, last director of the Board, made public a 74-page report of its activities on Sept. 30 and urged that the United States Government work towards a United Nations solution of the "international humanitarian problem" of finding permanent homes for the non-repatriable displaced persons of Europe. Citing instances of the Board's rescue activities, Mayor O'Dwyer declared that hundreds of thousands of persons were able to live and resist the Nazis in Europe because of the work of the War Refugee Board, established in January 1944.

WAR CRIMES

Throughout the year evidence of the horrible fate suffered by Jews and other anti-Nazis in Europe continued to pile up. In this country private citizens and Congressmen urged that crimes committed against Jews in Europe be punished as war crimes. A resolution was introduced in Congress proposing the appointment of a commission to cooperate with the War Crimes Commission in preparing definite plans for punishment of Axis criminals. Several major Jewish organizations testified in favor of the resolution.

The Jewish community followed with interest the decisions arrived at in Potsdam and made public in Washington on Aug. 2, which reaffirmed the intention of the United States, Great Britain, and the Soviet Union "to bring war criminals to a swift and sure justice." Under the Constitution of the International Military Tribunal anti-Jewish persecution or any crime committed in Axis countries against Jews before and during the war come within the jurisdiction of the Tribunal. American Jews were gratified to learn that.

PALESTINE

President Roosevelt's unequivocal stand in favor of a Jewish commonwealth in Palestine, as expressed in his statement to the Z.O.A. convention in October 1944, had aroused the hopes of Zionists that at last cognizance would be taken of Zionist demands and a definite solution proposed by the Great Powers. Prior to the Yalta Conference in February 1945, the Zionist Organization of America, the American Jewish Conference, the American Jewish Committee, and the American Palestine Committee (Senator Robert F. Wagner, chairman) addressed appeals to the President to place the Palestine question on the agenda. In his March 1, 1945 report to a joint session of Congress on the Big Three Conference at Yalta, President Roosevelt revealed that he had discussed the Arab-Jewish question during talks in Cairo with King Ibn Saud of Saudi Arabia.

When it was announced that the United Nations conference would be held at San Francisco, beginning on April 25, 1945, there was a demand from non-Jewish as well as Jewish sources that the Jewish people be given representation at the Conference, and that Jewish problems generally, and that of a Jewish home in particular, be placed on the agenda. Many public meetings were held, the largest on April 29 at the Lewisohn Stadium in New York City, where some 35,000 persons heard speakers plead for a hearing of the Jewish case at San Francisco, for immediate opening of the gates of Palestine to the Jewish survivors of the war and Nazi atrocities, and the reconstitution of Palestine as a free and democratic Jewish commonwealth.

Although the State Department included the American Jewish Committee and the American Jewish Conference among the 42 organizations invited to send representative consultants to the American delegates at San Francisco, the Jews were not given representation at the Conference, nor was the problem of Palestine placed on the agenda. The Arab states, which had entered the war on the side of the United Nations at the last moment and were opposed to Zionist demands, were given official representation at San Francisco. These facts caused great disappointment in many Jewish circles.

Many of the Jewish groups submitted demands and declarations to delegates of the United Nations. Representatives of the Jewish Agency for Palestine, presented a memorandum which asked that no action be taken at the San Francisco Conference which would be inconsistent with or prejudicial to the special rights of the Jewish people under the Balfour Declaration and the Palestine Mandate, and that such rights be expressly reserved and safeguarded. This recommendation was endorsed by the American Jewish Committee and other organizations. In advance of the San Francisco Conference, on April 2, 1945, the American Jewish Conference submitted a memorandum to Secretary of State Stettinius "on the needs and aspirations of the Jewish people at the present time and on the post-war world." The Palestine section called for the immediate opening of the gates of Palestine to Jewish immigration and the constitution of Palestine as a Jewish commonwealth.

The American Jewish Committee presented its recommendations in a volume titled *To the Counsellors of Peace*. With regard to Palestine the Committee reaffirmed its previous stand favoring an international trusteeship, responsible to the United Nations, in order "to safeguard the Jewish settlement in and the Jewish immigration into Palestine, to guarantee adequate scope for future growth and development to the full extent of the economic absorptive capacity of the country," and "to prepare the country to become, within a reasonable period of years, a self-governing commonwealth under a constitution and a bill of rights that will safeguard and protect these purposes and basic rights for all."

The Jewish Labor Committee, the Synagogue Council of America, the Hebrew Committee of National Liberation and the American Council for Judaism each submitted memoranda in support of its own program of action; all urged immediate immigration into Palestine of European Jews. President Truman in August revealed that, at the Big Three Conference in Potsdam, he had advocated free and open settlement of Palestine by Jews to the point consistent with the maintenance of civil peace. The President also stated that the matter of a Jewish state would have to be worked out with the British and the Arabs.

In September, the President received delegations of the American Zionist Emergency Council and the American Jewish Committee on the Palestine question. Public demonstrations, urging the British Government to permit free immigration into Palestine, were frequent. On Sept. 30, some 50,000 people attended a protest meeting against stoppage of Jewish immigration into Palestine in Madison Square Garden in New York City. On Oct. 24, an open air demonstration at Madison Square in New York City was attended by 250,000 people who adopted a resolution supporting the Jews in Palestine in their struggle "to rebuild the national life of the Jewish people" and condemning the British policy on Palestine.

A joint resolution was introduced in both Houses of Congress the last week in October calling for unlimited immigration to Palestine and for recognition of Palestine as a free and democratic commonwealth.

Efforts by Zionist groups to bring about a change in British policy towards Palestine continued to be unsuccessful as the year drew to a close and the quota of 75,000 immigration certificates allowed under the 1939 White Paper reached its limit. A joint Anglo-American Inquiry Commission was set up in November to investigate the problem of European Jews and to review the Palestine situation.

Despite the obstacles besetting their program of action, American Zionists continued planning for the resettlement of Palestine. The annual Conference for Palestine, held on Jan. 28, 1945, adopted a budget of $35,300,000 for the United Palestine Appeal and called upon American Jews to support a plan for resettlement in Palestine of 1,000,000 Jewish refugees within two years after the war. Other Zionist groups raised funds for the support of schools, hospitals, and children's settlements within Palestine.

RESTORATION OF RIGHTS

In December 1944, the American Jewish Committee proposed a six-point International Bill of Rights "to serve as a post-war guarantee of individual liberties throughout the world." The full proposals of the American Jewish Committee laid chief emphasis on the establishment of three commissions to be part of the world organization: commission on human rights, commission on statelessness, and commission on migration.

Other Jewish organizations concerned with the homelessness of the Jews in Europe made representation to European governments asking that property confiscated or stolen from Jews be returned to them. The Jewish Labor Committee, on Aug. 24, submitted to Georges Bidault, French Foreign Minister, a memorandum proposing that all Jews who lived or worked in France before the war should be assured, irrespective of their national origin, "of the right to live and work in the new French Republic," and that foreign Jews who were deported from France and found in concentration camps should be given the opportunity to return to France.

Representatives of the American Jewish Conference and the American Jewish Committee were accredited to

UNRRA to assist in developing legal procedure in connection with identification of displaced persons, to determine facts relative to resettlement and repatriation in various countries, to assist in clarifying the legal aspects of claims for restitution of confiscated property and to restore the morale of Jewish displaced persons. Other Jewish organizations sent teams of social workers to aid displaced persons in other ways.

POST-WAR PLANS

The major task of Jewish organizations during the year was the formulation of post-war plans; these were crystallized in programs presented at the United Nations Conference in San Francisco in April 1945. Forty-two national organizations, including the American Jewish Committee and the American Jewish Conference, were invited to designate one representative and two assistants each to serve as consultants and associate consultants to the American delegation at San Francisco. That section of the charter of the UNCIO which states that the United Nations shall promote human rights and fundamental freedoms for all was regarded by all organizations who had urged its inclusion as a major step in the direction of world peace.

SCIENCE—APPLICATION AND PRINCIPLES

DIVISION XVIII

MATHEMATICS AND ASTRONOMY

MATHEMATICS

By G. T. Whyburn
Professor, University of Virginia

GENERAL

In conformity with government regulations issued early in 1945 regularly scheduled meetings of the American Mathematical Society in February and April in New York and Chicago, respectively, were cancelled as was also a Summer Meeting which was originally planned for Montreal in June in connection with the Canadian Mathematical Congress. However, the Society was able to hold a highly successful Summer Meeting at Rutgers University in September. With the cancellation of the Office of Defense Transportation regulations concerning conventions, the normal series of meetings has now been resumed.

A large number of mathematicians continued to be engaged in research and other activities associated with the war during most of 1945. Despite this handicap, however, research and development in Mathematics for its own sake continued on a high level and resulted in publication at only a moderately reduced rate. Some of the significant developments will be treated briefly in what follows.

ANALYSIS

G. Pólya and G. Szegö developed a number of inequalities for the capacity of a condenser, among which is the following: The capacity C of the condenser formed by two parallel closed convex surfaces in three dimensions at distance h apart satisfies

$$A/h < 4\,C \leqslant m + A/h$$

where A is the area and M the integral mean curvature of the inner surface.

A new definition of exterior normal of a subset A of n-space at a point in the space was given by H. Federer, and the classical formula of Gauss-Green relating divergence in A and flux across the boundary of A was shown to hold under quite liberal conditions on the function and on the boundary of A. The conditions imposed on the boundary of A are a consequence of assuming the boundary has finite Carathéodory linear measure in the two dimensional case.

In the theory of measure it was shown by L. H. Loomis that by following older methods of Haar and Banach and defining measure directly in terms of converging ratios rather than by using an invariant integral, both the existence and the uniqueness of the Haar measure can be obtained simultaneously. Further, the proof uses only a very weak congruence relation, and the result applies in locally compact metric spaces.

FUNCTIONS

In connection with the famous hypothesis of Riemann concerning the zeros of the function $\zeta(s)$ defined by means of the infinite sum of $1/n^s$, which are of much significance in the theory of numbers, a valuable asymptotic relationship was established by E. K. Haviland. Using the related function $\xi(s)$, which has essentially the same zeros as $\zeta(s)$, Haviland derives a direct asymptotic relationship showing the behavior of the maximum M(r) of the modulus of $\xi(\frac{1}{2} + is)$ on the circle mod $s = r$ as r increases indefinitely whereas only a logarithmic approximation was known previously. The new relation is affected by each individual zero of $\xi(s)$, in contrast to the logarithmic approximation which was not influenced by the position of any finite set or of certain infinite sets of zeros.

In a general way a function of a real variable is considered to be "smooth" if it is differentiable in the ordinary calculus sense at each point. However, as is well known, a function may be continuous in an interval and yet not have a finite derivative at any single point in the interval. Such functions arise frequently in connection with trigonometric series; in this connection Riemann was led to a consideration of the smoothness of a function formulated somewhat less restrictively. This notion was further developed in 1945 by A. Zygmund who defines a function as *smooth* at a point provided it is defined in the neighborhood of the point and the ratio to h of the sum of its increments taken h units to the right and left of the point approaches zero with h. A function which has a finite derivative at each point of an interval is continuous and smooth in this sense throughout the interval, but not conversely. However, a function F which is continuous and smooth in this sense throughout an interval was known to have a finite derivative at-an-everywhere dense set E of points in the interval. Among the new results proven by Zygmund is one to the effect that if E is the set of all such points of differentiability of the function F on the interval, then F has the property of Darboux on E, *i.e.*, it takes on all intermediate values between any two of its values. Applications of this and other new results are made in the theory of trigonometric series.

CURVES AND SURFACES

The generally accepted concept of surface is based on a notion of equivalence due to Fréchet. A surface of the type of the circular disc (or 2-cell), for example, is a class of mutually equivalent representations, where a representation is a set of continuous functions defined on a given circular disc as parameter space and where two such representations T_1 and T_2 are equivalent in the Fréchet sense provided that for any positive number e the two parameter discs can be put into one to one continuous correspondence in such a way that T_1 and T_2 images of corresponding points are at distance apart less than e. A curve is defined similarly. Definitions of length and area for curves and surfaces in this sense have been given by several mathematicians, notably Lebesgue and Goecze.

In his 1945 Colloquium Lectures before the American Mathematical Society, T. Radó outlined a searching treatment of the entire subject of length and area and presented many new results obtained recently by him and his group of students and associates as well as covering the related work of others on the subject. Also in a paper published late in 1945 in the *Transactions of the American Mathematical Society,* Radó lays the topological foundation for his treatment of this subject by investigating closely the action of continuous mappings on Peano spaces, particularly with respect to Fréchet and other related notions of equivalence. In particular Radó establishes an important additivity theorem which affords conditions under which both Lebesgue Area and Goecze Area of a surface is cyclicly additive, *i.e.*, obtainable by adding the areas of the surfaces defined naturally on the separate cyclic elements of the middle space of the mapping when it is factored into its monotone and light factors. Also in a paper published in the *Proceedings of the National Academy of Sciences,* Radó defines a lower area $\alpha(S)$ of a surface S in terms of the essential multiplicity of functions of the mapping representation of the surface on subregions of the parameter space and develops conditions for existence of and relations between $\alpha(S)$, the Lebesgue Area $A(S)$ and the area $I(S)$ given by the classical area integral. In particular $\alpha(S) = A(S)$ in case S admits a representation of the form $z = f(x,y)$.

J. W. T. Youngs established the remarkable theorem that every surface whatever possesses a representation for which the classical double integral formula for area has definite meaning. Previously it was presumed that some surfaces had this useful property whereas others did not.

On the well known problem of Plateau of finding or showing the existence of surfaces of least area with given prescribed boundary, R. Courant obtained new results dealing with the case of surfaces with free boundaries, that is, the situation in which only part of the boundary is fully prescribed whereas the remainder, the *free* part, is merely restricted to prescribed boundary surfaces S. The existence of minimal surfaces M of least area in this situation had already been established; but the nature of the set of boundary points, or trace, of such a surface M on S was largely unknown except that this trace in general need not be a continuous curve. Courant shows that this trace will be a continuous curve if S is convex and if M is doubly connected and has its fixed boundary on a closed Jordan curve L outside S; and, further, it will be a rectifiable curve if in addition there exists a cone of supporting planes of S bounding together with S a portion of the space which contains L. Similar conclusions are asserted to be obtainable in the various other cases of the Plateau problem with free boundaries.

DIFFERENTIAL EQUATIONS

Significant advances in the theory of singular solutions of partial differential equations were made by J. F. Ritt and H. Levi. Ritt extended a theorem of his from ordinary differential polynomials to partial differential polynomials. The new result asserts that every irreducible component of the manifold of a partial differential polynomial is the general solution of some partial differential polynomial. Levi extends similarly a method due to Ritt and Levi of determining when an irreducible manifold in the manifold of a differential polynomial is essential, based on the so called "Low power theorem." Using these results of an algebraic nature as a basis, Ritt makes broad extensions of portions of Darboux's important work on singular solutions of first order partial differential equations. His treatment deals largely with the behavior of characteristics in the vicinity of singular solutions; and while his procedure is heavily influenced by algebraic viewpoints, it is nevertheless applicable to partial differential equations which are not of the algebraic type.

A. Wintner showed that if the assumptions of distinct real parts for the characteristic numbers in the constant matrix A_0 to which a matrix of functions $A(t)$ is assumed asymptotic in the work of Poincaré and Perron on analytic differential equations is reversed by supposing these characteristic numbers pure imaginary (or "stable"), a proper asymptotic relation between every solution $x(t)$ of the system $x' = A(t)x$ and a corresponding solution $y(t)$ of the trivial system $y' = A_0y$ may be obtained.

ELASTICITY

The prominent principle of statically equivalent loads, or Saint Venant's principle, in the theory of elasticity was discussed in an article by R. von Mises who shows that the principle in its traditional form does not hold true. The principle, stated only vaguely in many textbooks, is formulated by von Mises as follows: "If the forces acting upon a body are restricted to several small parts of the surface, each included in a small sphere, then the strains and stresses produced in the interior of the body at finite distance from all those parts are smaller in order of magnitude when the forces for each single part are in equilibrium than when they are not." He shows essentially that Saint Venant's principle is applicable if all forces involved are parallel and not tangential to the surface of the body, but not under more general conditions.

Also closely related to the work of Saint Venant is a paper by J. L. Synge in the *Quarterly of Applied Mathematics* dealing with the boundary value problem of the theory of elasticity for the cylinder with free sides and arbitrarily loaded ends. The problem was greatly simplified by Saint Venant by relinquishing the requirement of arbitrarily prescribable load distributions and introducing other hypotheses. Synge gives a precise mathematical formulation of the general problem and of the restricted problems related thereto and presents the Saint Venant solution for the restricted case in tensor notation. He also indicates possible methods of attack on the more general cases of the problem.

In this connection mention should be made of a comprehensive and largely self-contained treatment of the membrane theory of shells of revolution which was published in 1945 by C. Truesdell in the *Transactions of the American Mathematical Society.* The *membrane theory* of thin shells is concerned with portions of the shell far from supports or points where one of the radii of normal curvature is small where the moments and certain other terms are negligible in comparison to the resultant stresses—in contrast to the *bending theory* in which these terms are significant. Truesdell's paper supplements Flügge's book on statics and dynamics of shells, and many new results and new derivations are included.

STATISTICS

As formulated by A. Wald in a paper in the *Annals of Mathematics,* the problem of statistical inference is to construct a function w(E), called a statistical *decision function,* which associates with each sample observation (point)E an element w(E) of a given system S of subsets of a given class of distribution functions so that a certain hypothesis H_w is accepted when E is observed. A risk function is defined in terms of the weight function by means of a Stieltjes integral. Wald had defined earlier a decision function as optimum provided it minimizes the maximum of the risk function. In his paper here referred to he proves the existence of optimum decision functions, proves that any two such functions generate the same risk functions, and establishes other related results. Also relationships to von Neumann's interesting theory of games are brought out.

DIFFERENTIAL GEOMETRY

Interesting new characterizations of the Euclidean sphere were obtained by S. Chern in terms of differential-geometric properties. For example, a convex closed surface in Euclidean three space, differentiable of order three or higher and having a tangent plane at each point, is a sphere provided the differentials of the principal curvatures are linearly dependent in a linear relation with positive coefficients.

S. B. Myers proved that in a locally compact almost complete metric space any two points which can be joined by a rectifiable arc can be joined by a geodesic arc, thus extending substantially an earlier theorem of Menger. An almost complete metric space is one in which any sequence will converge provided that for any positive number e, any member of the sequence of sufficiently high index is joinable to all but a finite number of the other members by an arc of length less than e.

T. Y. Thomas showed that in general the mean curvature of a surface yields an algebraic determination of the second fundamental form of the surface and, indeed, succeeded in deriving the explicit equations giving this determination.

ALGEBRAIC GEOMETRY

C. Chevalley has developed a *local* theory for the intersection multiplicities of algebraic varieties which offers decided improvement over the theory of van der Waerden who first founded the notion of intersection multiplicity for two algebraic varieties. Chevalley's theory includes an intersection theory for algebroid varieties and succeeds in attributing a multiplicity to a component of the intersection of two varieties even in cases where other components of this intersection have high dimensions.

ABSTRACT ALGEBRA

In abstract algebra, N. Jacobson published a paper in which the foundations of a general theory of simple rings both associative and non-associative are laid. In case a simple associative ring contains either a minimal right ideal or a maximum right ideal a realization of the ring is obtained in the form of a ring of linear transformations in a vector space over a division ring. The structure theory developed here hinges essentially on an extension of Burnside's theorem on irreducible algebras of matrices.

R. P. Dilworth answered in the negative the question in Lattice Theory as to whether every lattice with unique complements is a Boolean algebra by showing that *every lattice* is a sublattice of a lattice with unique complements.

Contributions to the theory of forms were made by C. C. MacDuffee and by Gordon Pall. MacDuffee's work deals with algebraic forms of higher degree and discusses the theory of composition for principal ideal rings. Previously he had established a multiplication result for the determinants of matrices corresponding to ideals of an integral domain of a finite algebra over the quotient field of a ring. Pall reported a rapid method of computing complete systems of invariants of integral n-ary quadratic forms using coefficients in the rational field.

NUMBER THEORY

An elementary but powerful method of reducing the general problem of resolution of so-called separable system of diophantine equations to the case in which only equations and inequalities of degree not higher than two occur was developed by E. T. Bell. As a consequence, complete solutions of certain types of homogeneous equations of the second degree may be obtained whereas only special cases had yielded to previously known methods.

A classical problem of Euler concerns the diophantine equation $x^4 + y^4 + z^4 = w^4$ and asks whether there are non-trivial integer solutions of this equation. It was known that no such solutions exist with w less than 124; and in a paper by M. Ward published in 1945, a method was indicated by means of which the author has shown that no solution exists with w less than 10,000. Thus the existence of any solution of the required sort appears less likely.

J. Livingood found convergent series giving the number of partitions of a positive integer n into summands of the form $pl \pm a$ where p is a fixed prime greater than 3. The method and results are direct extensions of the work of Lehner for $p = 5$.

Conditions under which all totally positive integers possess decompositions into totally positive integral mth powers in a given algebraic number field K are developed in a paper by C. L. Siegel in the *Annals of Mathematics.* In particular it is shown that if K is totally real and if all totally positive integers are sums of integral squares in K then K is either the rational number field R or the real quadratic number field $R(\sqrt{5})$; whereas if K is not totally real, then this conclusion holds if, and only if, the discriminant of K is odd. Further, Siegel proves the sharper result that *five* integral squares are sufficient for the decomposition although *three* would not suffice in all cases.

GROUP THEORY

A system of elements with one composition satisfying essentially the same conditions as for a group with the omission of the associativity law is called a *loop*. In a paper published by R. Baer in 1945, homomorphism theorems for loops are developed quite analogous to the classical theorems of this type in group theory. Thus the associative law plays a small role in such theorems for ordinary groups.

Many problems of group theory are known to be concerned with the lattice of subgroups of a group rather than with the group elements. An important problem suggested by this situation is that of finding conditions under which two groups have isomorphic subgroup lattices. This problem had been considered by Baer for the case of abelian groups and in 1945 it was solved completely by A. W. Jones for the case of finite groups with modular subgroup lattices. Jones also shows that isomorphism between subgroup lattices of two groups does not in general imply isomorphism of the groups themselves.

TOPOLOGICAL GROUPS

Significant contributions to the theory of topological groups of transformations were made by Deane Montgomery and by S. Bochner. Montgomery showed that, if G is a compact effective group of transformations acting on an analytic manifold and if each transformation of G is analytic, then G does not contain arbitrarily small subgroups other than the identity and thus G is a Lie Group. He shows further the remarkable result that, if G is locally compact and acts on a manifold of class C^1 and each transformation of G is of class C^1, then the derivatives of the functions which define the transformations locally are equally uniformly continuous. This result is used to obtain the same conclusion mentioned above for a compact effective transformation group when the manifold acted on as well as the individual transformations are only assumed to be of class C^1. The same result has a most significant bearing on the work of Bochner in this connection. Bochner obtained substantial generalizations of theorems of Cartan and Caratheodory on automorphisms and general transformations of a domain into itself, succeeding in replacing the assumption of analyticity on the transforming functions by the condition of equicontinuity for the derivatives of these functions.

TOPOLOGY

It was shown by R. L. Moore that a plane continuum M having a tangent at each of its points in the sense of Besicovitch is of fairly simple structure from the topological viewpoint. In particular, every subcontinuum of M must be a continuous curve, the set of all emanation points of triods lying in M has a totally disconnected closure, and at most a countable number of points of M can be the origin of a ray tangent to M at that point, and the set of all such points is an inner limiting set and has a totally disconnected closure.

An axiom essentially to the effect that "every arc has two sides" was introduced and studied by G. S. Young in connection with axioms of R. L. Moore. Characterizations of open and closed two dimensional manifolds and of imbeddability in such manifolds were obtained by Young using this axiom.

A simple plane web as originally defined by R. L. Moore is a compact plane continuum M which admits two simultaneous upper semi-continuous decompositions G and W into continua satisfying (1) the hyperspaces of both G and W are dendrons, and (2) any pair of elements chosen from G and W respectively have a nonempty totally disconnected intersection. R. H. Bing showed that an equivalent definition is obtained if condition (1) is omitted. Bing also developed conditions under which collections of disjoint continua filling up a simple plane web are non-equicontinuous, and he announced a remarkable characterization of simple plane webs to the effect that a plane continuous curve is such a web if, and only if, it remains connected and locally connected on the omission of any countable set of points.

An interesting related study of the structure of continua X by means of the lattice D(X) of all upper semi-continuous decompositions of X into disjoint closed sets was made by M. E. Shanks. If $D_m(X)$ denotes the set of all decompositions in D(X) whose elements are continua, among other things Shanks showed that two continua X and Y are homeomorphic if, and only if, there is an isomorphism of $D_m(X)$ onto $D_m(Y)$ which carries the class of all simple decompositions in $D_m(X)$ onto the class of all simple decompositions in $D_m(Y)$, where a decomposition is simple if at most one of its elements is non-degenerate.

Extending former results of Schweigert, A. D. Wallace showed that any topological mapping of a compact connected Hausdorff space onto itself which leaves an end point e fixed also leaves invariant a continuum in the complement of e and having no cut point; further, if the space acted on is locally connected, some point other than e is also fixed.

The fruitful concept of regular convergence of a sequence of sets received further expansion and development in the work of P. A. White. *Co-regularity* of convergence and *completely avoidable regularity* of convergence are defined by White using bounding relationships in the complement of a point. Use of these properties enables one to carry over to the limit set much of the structure of the members of a convergent sequence of sets of a given type; this is particularly true in the case of simple curves and surfaces. Also White has proved that most of the fundamental results of Wallace concerning O-regular transformations carry over to the higher dimensions of regularity.

A transformation is called an isometry if it changes the distance between no pair of points at all and is called an e-isometry if it changes all such distances by at most e $(e > 0)$. D. H. Hyers and S. M. Ulam showed that, for transformations acting on an n-dimensional Euclidean or Hilbert space E and mapping E into itself, any e-isometry can be approximated arbitrarily closely by a true isometry.

Expanding a method developed earlier by him based on a combination of cohomology theory and some results on homology local connectedness, E. G. Begle obtained simple proofs for the Alexander Duality Theorem and other duality theorems for generalized manifolds. The Poincaré Duality Theorem had already been established by this method by Begle.

In continuation of earlier work of Hopf and Hurewicz, S. Eilenberg and S. Mac Lane developed further extensive relationships between the homology and the homotopy groups of a space. In particular it is shown that the homology and cohomology groups of an arcwise aspherical space are determined by the fundamental group (*i.e.*, the one dimensional homotopy group) of the space, where a space is aspherical if all homotopy groups of dimension greater than one reduce to the neutral element. Similar relations are obtained assuming all homotopy groups with dimensionalities between 1 and r reduce to the neutral element. In another paper the same two authors make an extensive study of a quite general nature of so-called natural equivalences. This embraces concepts, operations, and methods of reasoning familiar to many branches of mathematics; but as definite applications to topology are developed, it is mentioned here. Part of the value of this study lies in the unifying effect it may very well exert on the development of pure mathematics as a whole.

S. Eilenberg and N. E. Steenrod presented in outline form an axiomatic treatment of homology theory based on abelian homology groups, a boundary operator and an induced homomorphism associated with each mapping as primitive concepts, rather than on complexes. The detailed treatment is promised in book form.

TOPOLOGICAL DYNAMICS

In a study of homeomorphisms with almost periodic properties, M. Garcia defines orbit connectedness of two points in the space and the corresponding notion of orbit component of the space, both concepts depending on a given mapping, of course. The resulting properties are developed and shown to have significant bearing on the more usual dynamical properties such as recurrence, transitivity, minimal sets, and so on.

P. Erdös and A. H. Stone extended to non-compact spaces and to mappings not necessarily topological certain results of Gottschalk concerning powers of recurrent or almost periodic mappings, at the same time obtaining simplified proofs. They showed, further, that a homeomorphism acting on a totally bounded metric space and all of whose negative powers are equi-uniformly continuous, is necessarily almost periodic; if in addition also the positive powers are equi-uniformly continuous, there are two infinite sequences of powers of the mapping each converging uniformly to the identity mapping and where the indices of the second sequence are the squares of those in the first.

ASTRONOMY

By Rupert Wildt

Assistant Professor, University of Virginia

MEETINGS AND PERSONNEL

The American Astronomical Society did not meet during 1944. The regular winter meeting, scheduled for Feb. 27-28, 1945, had to be cancelled because of wartime travel restrictions, but a business meeting of the Council was held in June at the Harvard College Observatory. Plans had been under discussion for some time to honor Dr. Henry Norris Russell, dean of U. S. astronomers and past president of the Society, upon the completion of 40 years on the faculty of Princeton University. The Council of the Society approved of the suggestion to establish a permanent lectureship in his name, and a committee was formed to raise the necessary funds to maintain an annual lectureship of international significance.

During the year, new directors were appointed at three of the largest observatories. Upon the retirement of Dr. Walter S. Adams, Dr. Ira S. Bowen will become Director of the Mount Wilson Observatory (Carnegie Institution of Washington), at Pasadena; he will also be in charge of the new Astrophysical Observatory of the California Institute of Technology, which has been under construction for several years on Mt. Palomar, near San Diego, Calif. Work on the 200-inch telescope, which will be the chief instrument of the new observatory, had to be abandoned during the war, but was resumed toward the end of the year. At the Lick Observatory of the University of California, on Mt. Hamilton, Dr. C. D. Shane has succeeded Dr. J. H. Moore as director. Dr. Harold L. Alden, since 1925 in charge of the Yale University Observatory's station at Johannesburg, South Africa, returned to the United States to assume the directorship of the Leander McCormick Observatory of the University of Virginia, as successor to Dr. S. A. Mitchell.

Dr. Richard Prager, Research Associate of the Harvard Observatory, an international authority on the study of variable stars, died July 20, at the age of 62.

The Catherine Wolfe Bruce Gold Medal of the Astronomical Society of the Pacific was awarded for the year 1945 to Dr. E. A. Milne, fellow of Wadham College and Professor of Mathematics in Oxford University. No award of the Bruce Medal had been made during the preceding three war years.

TOTAL SOLAR ECLIPSE

The cessation of hostilities in Europe facilitated an intensive study of the total solar eclipse which occurred on July 9, 1945. According to newspaper reports, 20 groups of Soviet astronomers were assembled along the

Russian part of the path of totality, and 12 expeditions were located at Skelleftea, Sweden. It is particularly gratifying that a French party, consisting of six astronomers, were able to go to Sweden and were favored by the weather. On this continent, Dr. D. H. Menzel, of Harvard, had set up elaborate equipment at Bredenbury, Saskatchewan, but was completely foiled by bad weather.

The operation "Eclipse," planned by the Royal Canadian Air Force for the purpose of making photographic observations of this eclipse from the air, deserves special mention. The program was carried out by No. 7 Photo Reconnaissance Wing of the Air Force, and was coordinated with the comprehensive series of ion-spheric observations sponsored by the Canadian Radio Wave Propagation Committee. The Central Navigation School of the R. C. A. F. at Rivers, Man. served as base of operation. Four airplanes were employed, a Spitfire, a Mitchell, and two Ansons. In three of these, seven cameras (three spectrographic and four direct) were mounted, the camera axes being directed out the port sides of the planes at an elevation of 12 degrees. The fourth aircraft, an Anson flying at 15,000 feet, was employed to give motion picture coverage of the partial and total phases.

The spectrographic observations were designed to obtain a complete photographic record of the chromosphere and corona throughout totality, and in particular to make a study of the polarization in these spectra. The direct cameras were used to record the corona and prominences in the visual region as well as in the infra red. All cameras were standard types used in aerial photography; they were mounted behind windows of specially selected plate glass. With a strong tail wind, the actual run across the eclipse path was made at a ground speed of 250 miles an hour; temperature was near —40°F. As far as is known, the first photographs of an eclipse from over 30,000 feet altitude and the first spectra taken from the air were secured in this operation. A preliminary examination of the photographs indicated that results of great significance can be anticipated. Further investigation will be in the hands of Dr. Peter M. Millman, a squadron leader in the R. C. A. F., upon his return to his peacetime pursuits as a staff member of the David Dunlap Observatory of the University of Toronto.

SOLAR SPICULES

The most recent addition to the Harvard College Observatory's far-flung activities is the Fremont Pass Station at Climax, Col., which is equipped with a coronagraph. This ingenious instrument, invented about 10 years ago by the French astronomer, B. Lyot, is designed to cut down the glare of the solar light scattered by the earth's atmosphere and thus to record the faintly luminous phenomena at the solar limb, which until then had been accessible to inspection only during total solar eclipses. W. O. Roberts, who has been in charge of the Fremont Pass Station, succeeded in following cinematographically the development and decay of what he calls solar spicules, tiny spike-like prominences at the solar limb. They have been previously observed under good atmospheric conditions during eclipses, but it was the coronagraph which permitted systematic studies of their number and duration.

The spicules are most commonly seen near the polar regions of the sun and last only four or five minutes. As many as 25 spicules have been seen simultaneously in a 60-degree arc of the sun's polar limb. Their width and height is of the order of a few seconds of arc. The velocity of motion of a typical spicule is estimated to be about 30 km/sec radially outward from the sun's center. Spicules appear to possess characteristics very similar to those now ascribed to solar granulations, and indeed may represent essentially the same phenomena viewed in projection against the solar limb which are known as granules when observed in projection on the disc.

NEW COMETS

Beside the return of several well-known periodic comets, some new comets were discovered; none of them was a conspicuous object. The first was observed by D. du Toit at the Boyden Station of the Harvard College Observatory in South Africa, on April 9. This comet, found in the constellation Leo, was of the 10th magnitude. Though well situated for observation in the northern hemisphere, too, no observations were obtained here. A second new comet of the 10th magnitude was announced by the same observer on June 11. Since the comet was located in Cetus and moved in southwesterly direction, it could not easily be reached from northern observations, but it has been well followed by southern observers.

The discovery of a new comet was reported on July 2 by Leslie C. Peltier, of Delphos, O., a distinguished amateur astronomer who already has several comet discoveries to his credit. An orbit of this object computed from observations made at the Lick Observatory turned out to be identical with that of Comet Kopff.

On Dec. 11, du Toit discovered his third comet, an object of 7th magnitude, at declination —65°.

NOVAE 1945

N. Tamm, at his private observatory in Sweden, discovered a nova of 7.5th magnitude in Aquila on Aug. 28. The spectrum, similar to that of Nova Geminorum, indicated that the nova was then already past its maximum light phase; probably 1½ magnitudes fainter than at its maximum.

In the course of a survey of objective prism plates taken at the Leander McCormick Observatory, Father W. J. Miller, S. J., has found a 12th-magnitude star in Lyra with a spectrum of nova-like features. The star is a variable, apparently with recurrent-nova characteristics. Examination of Harvard plates from the 1890's onward shows this star to have reached a maximum of 11th or 12th magnitude several times in the past 50 years. Most recently it was between 10.5 and 11.0 from May 29 to June 4, 1944.

On April 6, M. L. Humason discovered a supernova in the galaxy NGC 5195, a companion to the famous spiral nebula M51 in Canes Venatici, which he then had under observation for the first time in three years. He noticed the presence of the faint star with which he was not previously familiar and confirmed his suspicion that it might be a supernova by obtaining a spectrum on the following night. The star faded rapidly thereafter and would probably have been overlooked a few weeks later. The fact that a supernova appears in a spiral nebula but once in about every 400 years makes the coincidence seem all the more remarkable. Most supernovae are later discovered accidentally on photographic plates not minutely examined at the time they were exposed.

SPECTROPHOTOMETRY OF VARIABLE STARS

The study of the intensity variations of stellar light forms an important part of observational astronomy. Thousands of intrinsically variable stars are known by this time, beside the so-called eclipsing variables. Since it is difficult to keep such large numbers of objects under steady surveillance, professional astronomers have come to rely in this field of study on the collaboration of amateurs, organized in this country as the American Association of Variable Star Observers. While the amateurs continue to do an admirable job in keeping track of the majority of variable stars, the detailed investigation of the finer traits of variability demands such large instrumental means that it remains the prerogative of the big observatories to analyze the spectra and radial velocities. During the past year two important contributions have come from United States observatories dealing with the variation in monochromatic light of the two stars δ Cephei and Mira Ceti, which are the prototypes of the classes known as Cepheids and Mira Variables.

At the Mt. Wilson Observatory, J. Stebbins has determined the photoelectric light-curves of δ Cephei in six colors (isolated by filters) ranging from ultraviolet (λ 3530 A) to infrared (λ 10,300 A). These curves are all smooth, without secondary fluctuations, and are repeated accurately over years at a time. The amplitude of variation decreases from $1.^m48$ in the ultraviolet to $0.^m43$ in the infrared. The times of maximum and minimum are progressively later with larger wave lengths, the displacement of phase amounting to 0.05 period, or 0.27 day, between λ3530 and λ10,300. The colors and spectrum of δ Cephei at maximum light match closely the colors and spectra of super giant stars of type cF4, while at minimum the match is with type cG2. The general nature of these color phenomena of Cepheid variation has been well known for some time, but never before have observations of such high accuracy been obtained; hence Stebbins' work should prove of utmost value for a detailed test of the mathematical theory of Cepheid variation, as developed by Eddington and M. Schwarzschild.

At Harvard, R. M. Scott made a photometric investigation of the continuous background in the spectrum of Mira Ceti, and has proved that the entire variation in the photographic magnitude can be explained as the result of the variation of the surface temperature of this star and of the ensuing variation of molecular and atomic absorption. The monochromatic magnitude at λ4150 agrees with the magnitudes predicted from the radiometric temperatures and thus precludes any variation produced by non-selective absorption. Moreover, the level within the atmosphere of the source of the hydrogen absorption is definitely placed beneath the level of the calcium absorption. The quantitative behavior of the α emission line of hydrogen located within the contour of the calcium absorption line is accurately explained by this assumption.

T TAURI VARIABLE STARS

A. H. Joy, at the Mt. Wilson Observatory, completed a study of the spectra of 11 irregular variable stars, forming a class known as the T Tauri variables. Its distinctive characteristics are: (1) irregular light variations of about three magnitudes, (2) spectral type F5-G5 with emission lines resembling those of solar chromosphere, (3) low luminosity, and (4) association with dark or light nebulosity. The stars are situated in or near the Milky Way dark clouds in the direction of the center or of the anticenter of our galaxy.

Spectroscopic absolute magnitudes of three stars of the group, together with meager indirect evidence, indicate that the T Tauri stars are dwarfs of the main sequence. Color indices of five show some color excess, which is probably the result of selective absorption by surrounding nebulosity. Radial velocity measures from absorption lines are different when the emission spectrum is present. Lack of agreement in the measures of both absorption and emission spectra indicates irregular atmospheric motions. In the mean the emission lines are displaced toward the violet with respect to the absorption lines. Among the emission lines λ4202 and λ4307 of Iron show a singular behavior, being much enhanced relatively to the rest of the lines belonging to the same multiplet. This peculiarity has recently been discovered quite independently by G. H. Herbig, who suggested a special fluorescence mechanism apparently capable of explaining the selective enhancement of these lines.

ANDROMEDA NEBULA

In recent years it has become increasingly evident that the Andromeda nebula (M31) is a stellar system similar to our own galaxy in size, probably similar in form and structure, and possibly so in stellar composition. C. K. Seyfert and J. J. Nassau have applied the method of star counts to the study of the Andromeda Nebula, not only in order to increase our knowledge about the composition of that system, but to give us additional clues by analogy about the structure of the Milky Way.

Counts of stars with apparent magnitudes ranging from 15.0 to 18.5 in and around the Andromeda Nebula have been made on blue-sensitive plates taken with the 24-36-inch Schmidt telescope of the Case School of Applied Science. In order to calibrate the counts, magnitudes of a sequence of stars near M31 from 14.9 mag. to 18.3 mag, were determined by comparison with Selected Area 20 and the North Polar Sequence. The counts, corrected for the foreground stars, show a total of 2,564 stars belonging to M31 between the limits of absolute magnitude —3.8 and —6.3. The apparent shape of M31 as outlined by the counts is roughly elliptical and agrees reasonably well with isophotal contours of the spiral obtained from the same plates by means of a recording microphotometer.

Combining their results with those recently arrived at by W. Baade, on the basis of Mt. Wilson photographs of M31, the authors present the following picture of the Andromeda Nebula: (a) a nucleus of approximately 1,000 parsecs diameter, composed of relatively low-luminosity stars fainter than —1.1 abs. mag.; (b) the main body of the spiral with a diameter of 6,000 parsecs, containing highly luminous stars as bright as —6.3 abs. mag.; (c) the boundary region of the spiral, as detected by star counts, extending from the main body to about 11,000 parsecs diameter, in which no stars brighter than —5.3 abs. mag. are found from the counts; (d) the faint outer envelope extending to perhaps 25,000 parsecs diameter, detectable only with the photoelectric cell or from microphotometer tracings of photographs. The fact that this shell contains no stars brighter than —3.8 in sufficient numbers to be detected by the star counts suggests that the envelope may have a stellar composition similar to that of the nucleus. This inference is supported by the fact that Baade observed numerous extremely faint stars along the minor axis of M31 to a distance of 32 minuses of arc from the center.

ENGINEERING AND CONSTRUCTION

STRUCTURAL ENGINEERING

By William A. Oliver*
Associate Professor, University of Illinois

GENERAL

Probably the most important accomplishment of the construction industry during 1945 was the progress made in post-war planning. While work was done and important structures were completed, evidence shows that the industry spent a large share of the time looking hopefully into the future. Although the construction industry has apparently been comparatively free of labor strikes and unrest, labor conditions in the manufacturing industries have handicapped it from two directions. On the one hand labor difficulties among the materials and equipment manufacturers caused a lag in the production of construction materials for peacetime building and on the other hand these same difficulties caused management to be slow in projecting and getting underway plant expansion for peacetime activities. There is need to be somewhat less than optimistic in view of conditions in industry as they exist at present but some comfort can be obtained from the realization that, after a worldwide catastrophe like the recent war, even under the best of conditions turmoil was bound to exist universally during the period of readjustment.

After the above somewhat pessimistic statements have been made, it should be immediately noted that the War Production Board estimated that the total volume of construction in the United States for 1945 was $4,500,000,000, an increase of about 15 per cent over the preceding year. However, 1944 was the low year for the construction industry, the volume during that year being less than half what it was in 1942 and 1943, the peak war years. Nevertheless, while total construction for 1945 lagged considerably behind what it is during normal years it is encouraging to be able to state that the trend is upward. It must be remembered that comparative annual construction volumes for the past four or five years can not be obtained accurately by comparing annual construction costs since the costs have been consistently increasing, yet these cost figures may be taken as satisfactory for the purposes of this review.

There is another encouraging and agreeable fact regarding construction during 1945 which should be mentioned. During the war years, as was to be expected, public construction far exceeded private construction. As a matter of fact there was practically none of the latter until 1944 when the amount began to show an increase. In 1945 private construction consistently continued this increase while the total amount of public construction declined, and it is interesting to note that during August, the month in which V-J Day occurred, private construction exceeded public construction for the first time for a number of years. The trend of the one has continued to be upward and that of the latter downward.

---

* The author wishes to make acknowledgment to the following sources for factual material presented—*Engineering News-Record*, Tennessee Valley Authority, Bureau of Reclamation, Chief of Engineers of the U. S. Army, and various technical associations.

A few words regarding the future are of interest. The War Production Board forecast that the total volume of new construction for 1946 will be approximately $6,500,000,000, 44 per cent above the 1945 level. Of this, an estimated $4,350,000,000 will be invested in private construction, an increase of about 73 per cent over that of 1945. It appears probable that public construction, the balance wheel of employment, will move forward only where essential, thus leaving both labor and material fully available for private construction until the more pressing needs of the latter have been satisfied. The construction requirements of the country are such that this accelerating activity should continue for a number of years. All prognostications are of course dependent upon the condition that labor and management are able to iron out their differences.

Research as well as progress generally in the use of the three major construction materials — concrete, steel, and timber — went forward during the year although the rate of advance was evidently much slower than during the rush of the war years. While progress in new methods of construction is not primarily dependent upon business conditions in the industry, such progress inevitably lags when business conditions are poor.

Before discussing the three materials mentioned above attention should be drawn to a fourth material—high strength aluminum alloys—which, now that the war is over, may loom larger in the construction field particularly where light weight and comparatively high strength are primary requirements. During the war, demands for aluminum for other purposes were so large that a greatly expanded production capacity was necessary in order to produce the amount needed. With hostilities ended, these unusual requirements will no longer exist, so that larger quantities of the material than ever before should be available for buildings, bridges, and related purposes. This supposition is supported by the increase in the number of news items and articles concerning aluminum alloys which recently appeared in the technical press.

Trade and technical organizations interested in advancing the use of all three of the materials—concrete, steel and wood—are proposing new specifications in which the higher working stresses, made mandatory for temporary war construction by War Production Board directives are recommended for permanent post-war construction. The interested associations justify these higher working stresses on the basis of increased knowledge in the theories of structural analysis, increased skill in methods of erection and construction, and more rigid production controls over the quality of the material. Although these new specifications have not as yet been generally accepted by the engineering profession, upon due consideration they probably will be, with minor changes being made to conform to the thinking of the professional societies.

Functional design, where the form of the structure expresses its purpose, has been receiving an increasing amount of attention because of the stimulation war gives to all fields of endeavor. Reinforced concrete, frequently called liquid stone by the architect, is a material which readily adapts itself to this expression of function. Deposited in a wet condition it flows into any shape desired. As a result of the developments which have taken place in flame cutting, welding technic, and in the production of more weldable steels, steel construction, also, has become more fluid. As a result of new methods of fastening and new physical properties gained through impregnation processes, even wood, long considered the most limited of the construction materials in scope of form, has been used for structural forms deemed impossible for that material a very few years ago.

These general statements regarding functional design are exemplified by

150-ft. diameter elliptical thin shell concrete domes, long span welded steel rigid-frame members and long span glued laminated wood arches to mention only a few. These developments are not confined to 1945, nor even to the war years, but sufficient consideration has been given to them during the past 12 months to make them worthy of note in a review of 1945 progress.

Cement production is an index of the volume of concrete construction. During the first ten months of 1945 material shipment statistics showed a movement of 89,956 barrels of cement, a 9 per cent increase over the amount moved during the same period in 1944. The tonnage of fabricated structural steel for the first ten months was reported as 631,891 tons, an increase of 31 per cent above the tonnage for the same period in 1944.

The Lumber Survey Committee, made up of a group of the nation's leading business men and reporting to the Secretary of Commerce, reports that lumber production is still declining in the face of unprecedented demand. The quarterly report (Nov. 23, 1945) indicates that the continuing decline is the result of restrictive OPA pricing, labor and equipment shortages, and strikes with little prospect of relief of the situation before next spring. National Lumber Manufacturers Association estimates show a 1945 production of 26,700,000,000 feet with a total consumption for the year of 29,313,000,000 feet. The reports for 1944 showed a production of 33,800,000,000 feet. During 1944 and 1945 wood was the most critical of our materials of construction and will continue to be so for some time in the future.

A review of the more interesting or important construction projects where significant progress was made during the year or which were completed is presented in the following pages. This includes the work of the three great Federal construction agencies, the Tennessee Valley Authority, the Bureau of Reclamation, and the Corps of Engineers, U. S. Army.

DAMS AND RELATED WORKS

General.—During 1944, President Roosevelt proposed the establishment of a Missouri Valley Authority patterned after the Tennessee Valley Authority established in 1933. This was to be for the purpose of developing flood control, irrigation, navigation, and hydroelectric power in the basin of the Missouri River. Considerable opposition to this plan of accomplishing the work has developed, particularly in the West, and while definite methods of procedure are still in process of formation indications are that existing Federal agencies will eventually construct the project. The agencies now involved are the Corps of Engineers, U. S. Army, and eight agencies of the Department of the Interior—Bureau of Reclamation, Geological Survey, Fish and Wildlife Service, Bureau of Mines, Office of Indian Affairs, General Land Office, National Park Service, and the Grazing Service. The Bureau of Reclamation and Corps of Engineers will of course play the major roles. The former will handle projects primarily related to irrigation while the latter will build those related to flood control and navigation.

It seems apparent that similar developments will eventually be carried out in all of our great river valleys. President Truman has recently suggested the establishment of an agency to "study and maintain inventories of national wealth and resources." These proposals are all indicative of the great volume of construction which will be accomplished in the next few decades.

TENNESSEE VALLEY AUTHORITY

During the calendar year, construction operations on Kentucky and Fontana Projects, the last in the war emergency program, were pushed to virtual completion. Thus, the physical structures contemplated by the TVA Act of May 1933 and by the subsequent emergency war measures for the control of floods, for the regulation of navigation depths in the main river, and for the generation of electric power have come close to full realization. Regardless of what controversy may have been instigated by the political and social implications of the Tennessee Valley Authority project, no criticism has ever been advanced concerning the integrity of its engineering design and construction, and the completion of that project marks a milestone in engineering accomplishment.

Hydro plants acquired by TVA have a total capacity of 341,482 kilowatts and fuel plants acquired have a capacity of 196,400 kilowatts. By agreement, the operation of eight hydro plants owned by the Aluminum Company of America, with a capacity of 311,120 kilowatts, is directed by TVA as an integral part of the overall system. In addition, 20,000 kilowatts of steam capacity is leased. The total system capacity at the end of 1945 was 2,545,102 kilowatts. The useful reservoir storage capacity of the entire TVA system of reservoirs is 13,200,000 acre-feet.

KENTUCKY PROJECT

Major construction operations in the powerhouse and switchyard area continued during the year. The third 32,000-kilowatt-capacity generating unit was placed in commercial operation on April 6 and the fourth unit was scheduled for December 1945. The fifth and final unit is under construction and will be completed late in 1946.

In January, the four concrete pontoon sections comprising the upper lock guard boom were floated from their construction berth on the downstream left bank to their final position where they were assembled and grouted into a single unit. The second 100-ton intake and spillway gantry crane was completed in May. The abandoned Illinois Central Railroad bridge below the dam was removed, and five spans were salvaged for reuse in the new Nashville, Chattanooga & St. Louis Railroad bridge near Trotter's Landing, 78 miles above Kentucky Dam. Three 300-foot spans were moved intact on a special floating rig by the contractor.

In the reservoir, the 310 miles of highway relocation work, including four major highway bridges, neared completion. The 38 miles of railroad relocation including the Illinois Central, Nashville, Chattanooga & St. Louis, and Louisville & Nashville Railroad relocation work was practically finished. This included two major railroad bridges crossing the reservoir, the L & N Railroad bridge at Danville, Tenn., which was raised for reservoir and navigation clearance, and which was placed in service in June of 1944, and the nearly complete new N. C. & St. L. Railroad bridge at Trotter's Landing, 78 miles above the dam.

The Kentucky Project was dedicated by President Truman on Oct. 10.

FONTANA PROJECT

A total of 2,806,000 cubic yards of concrete has been placed in Fontana Dam. The powerhouse and switchyard were virtually completed during the year and two 67,500-kilowatt-capacity generating units were placed in commercial operation on Jan. 20 and March 24. A third unit can be installed readily at any time. Other major items of construction during 1945 included completion of the foundation grout curtain, completion of the mass concrete cooling, and reconstituting the system of separate blocks into a monolithic structure by pressure grouting of the joints. The transverse and longitudinal joints performed their function as planned, and the structure, now in full service, is virtually free from cracks. The twin 34-foot diameter spillway tunnels through the left abutment were completed in April, including concrete lining, diversion tunnel plugs, and special diversion buckets at the discharge end of the tunnels. The reservoir filled rapidly during the early months of the year, and on May 24 reached a level 11 feet above the spillway crest (a depth of more than 400 feet at the dam) before the demand for water downstream caused a gradual lowering. On June 16, tests were conducted on the spillway with total discharges up to 18,800 cubic feet per second.

These tests were satisfactory and substantiated predictions made from model tests in the Norris laboratory.

After V-J Day, work was pushed on the construction of visitors' facilities at the dam. These include extension of the access road to the top of the dam, a visitors' building on top of the left abutment, and an inclined railway from the visitors' building to the powerhouse. Final grading and surfacing about the dam was substantially completed, and parking areas were constructed on both abutments. The access road crossing the dam will eventually be linked with the Great Smoky Mountains National Park system of roads.

In the reservoir area, all work was completed on the 30 miles of highway and 16 miles of railroad relocation, including one major highway bridge and two major railroad bridges.

MISCELLANEOUS DAM PROJECTS

At Watts Bar Steam Plant, the fourth and final 60,000-kilowatt-capacity steam generating unit was placed in operation April 8. The Fused Tri-calcium Phosphate Plant at Godwin, Tenn. was completed in May. At Great Falls Dam on Caney Fork, a tributary of the Cumberland River, an interesting asphalt and cement grouting program for the stoppage of water losses through the peninsula between the Collins River (reservoir level) and Caney Fork (below the dam) was started in July.

Miscellaneous construction operations during the year included channel widening below Fort Loudoun and Watts Bar Dams and a number of smaller projects for the operating departments.

BUREAU OF RECLAMATION PROJECTS

General.—Construction being carried on by the Bureau of Reclamation during the year continued to be restricted because of wartime regulations and shortages of labor, equipment, and materials. As stated previously, the Bureau has devoted considerable attention to surveys, investigations, and designs for units of the Missouri River Valley project. Because of the consideration which is being given by the Federal Government to the regional development of the great river basins, the work of the Bureau should be on an expanding basis for many years to come.

All-American Canal System—California.—Work was continued on the construction of 11 miles of the concrete-lined Coachella Canal, which will supply irrigation water to approximately 80,000 acres of land in the Coachella Valley Water District. Specifications were issued for the construction of an additional 11 miles of this canal, and it is anticipated that actual construction will be started early in 1946.

Altus Project—Oklahoma.—Altus Dam, a granite-faced concrete gravity type structure 95 feet high, to create a reservoir of 160,000 acre-feet capacity, was completed except for the installation of the spillway gates and bridge. The reservoir system, which includes several dikes and highway and railroad relocations, was practically completed. The Main Canal, 4.2 miles long, including a 2,200-foot concrete siphon of 10-foot 3-inch diameter under the North Fork of the Red River, has been completed, and construction of seven miles of the Altus Canal is in progress.

Boisé Project—Idaho, Anderson Ranch Dam.—The principal work on this project was placing earth embankment and constructing the outlet works for diversion purposes. By the end of October, approximately 6,900,000 cu. yds. of earthfill had been placed, bringing the dam embankment to 300 feet above foundation and within 142 feet of the crest. The dam will create a reservoir with storage capacity of 500,000 acre-feet for supplemental irrigation of lands at present inadequately supplied, also for future power development and flood and silt control.

Boulder Canyon Project—Arizona-Nevada.—Tunnel and river channel improvement below Boulder Dam found necessary during the year is now in progress. It includes extending the four 50-foot outlet tunnels, dredging the river channel for several thousand feet below the tunnel portals, removing material from the canyon walls, and relocating a stretch of road.

Buffalo Rapids Project—Montana.—Construction of two units of this project, each consisting of a pumping plant and a canal system, was completed during the year. The Shirley Unit provides irrigation for 5,300 acres and the Terry Unit for 2,800 acres.

Central Valley Project—California.—Shasta Dam and power plant were completed and accepted on June 20; three 75,000 kv-a generating units, three 100 ft. by 28 ft. drum gates, and 14 spillway outlet valves remain to be installed. No work was done at Keswick Dam and power plant. Construction of the 37-mile Madera Canal was completed and irrigation water was delivered during the 1945 irrigation season to the Madera Irrigation District for replenishment of underground water and surface irrigation. This district has about 83,000 acres under irrigation, largely by pumping from the underground supply. A beginning was made on the 156-mile Friant-Kern Canal by letting a contract for 5.6 miles, which was 15 per cent complete at the end of the year. Preparations were made to install crest gates on Friant Dam.

Colorado-Big Thompson Project—Colorado.—Alva B. Adams Tunnel through the Continental Divide, which is 13 miles in length, was holed through during 1944 and is now being lined with concrete. The construction of Shadow Mountain Dam and dikes continued. A connecting channel between Grand Lake and Shadow Mountain Lake was completed.

Columbia Basin Project—Washington.—Construction work on this project during 1945 consisted mostly of work preliminary to repairs to the spillway bucket, such as construction of the dry dock for the inspection caisson, fabrication of the caisson, installation of eight large needle valves in the generator pits of the right powerhouse for the purpose of bypassing water during bucket repair operations, stabilizing the river banks downstream from the dam, and channel dredging of the river downstream from the dam. Work preparatory to installing the last three main generator units in the left power plant has been initiated. Two 75,000 kv-a generating units are being dismantled for return to the Shasta Unit, Central Valley Project.

Davis Dam Project—Arizona-Nevada.—The construction of 140 miles of 161 kv wood pole transmission line from Parker Power Plant to Phoenix, Ariz. was practically completed. This line will deliver power from the Parker Power Plant to Phoenix until such time as the Davis Power Plant and transmission system are completed.

Deschutes Project — Oregon. — Progress was made on the construction of Wickiup Dam and the clearing of the reservoir area to create a reservoir of 185,000 acre-foot capacity. Construction of the North Unit Main Canal to a point sufficient to provide water for the first 20,000 acres to be irrigated will be completed by the end of 1945, with the exception of the Crooked River Crossing structure. Construction of the laterals for the first 20,000 acres will be completed in time for the next irrigation season. The alteration work at Cove Power Plant for installing an additional 1,500 kw generating unit is well along. Field survey and topographic work preliminary to construction of the balance of the North Unit Main Canal and the remaining 30,000 acres of laterals to be developed for this area is under way.

Fort Peck Project—Montana.—The 20-mile Frazer-to-Wolf Point transmission line was completed in February, 1945. The 140-mile Fort Peck-to-Glendive line is in the final stage of construction and probably ready for operation by the end of the year.

Gila Project—Arizona.—Progress has been made on the construction of the works necessary to deliver irrigation water to 8,500 acres. This has been confined to the rebuilding and mortar lining of the canals and laterals in the 8,500 acre predevelopment area of the Yuma Mesa Division of the Gila Project.

Intake Project—Montana.—Construction of this project was completed during 1945. The project consists of a pumping plant located along the main canal of the Lower Yellowstone Project and canal laterals to irrigate 840 acres adjacent to the Lower Yellowstone Project.

Klamath Project—Oregon-California, Tule Lake Division.—The Modoc Unit of the Klamath Project comprised the development of 12,500 acres of land in the Tule Lake bed. Construction of three pumping plants, A, B, and C, was completed during 1945. Pumping plant A consists of three units of 33-1/3 cubic feet per second under a head of 20 feet; plant B, three units of 25 cubic feet per second under a head of 12 feet; plant C, three units of 33-1/3 cubic feet per second under a head of 12 feet. Work continued on the Modoc Unit extension to make available an additional 6,100 acres, comprising 84 per cent of the construction on the Klamath straits drain outlet and 53 per cent of the construction on two pumping plants, two units, each 100 cubic feet per second under a head of 10.5 feet; and structures on the Klamath straits drain outlet.

Mirage Flats Project—Nebraska.—Box Butte Dam, an earth dam approximately 5,400 feet long and 64 feet high, was practically completed during 1945. Dunlap Division Dam on the Niobrara River below Box Butte Dam was completed and canal and lateral construction was started.

Provo River Project—Utah.—Construction on the Salt Lake Aqueduct and the Provo Reservoir Canal continued throughout 1945 by authority of the War Production Board since these structures are a part of the Salt Lake City Municipal Water Supply System. The Salt Lake Aqueduct will ultimately carry municipal and irrigation water from the Deer Creek Reservoir (completed in 1941) on the Provo River to Salt Lake City, a distance of 41 miles. The Provo Reservoir Canal is a feeder canal in this system. The aqueduct consists of a 69-inch diameter precast concrete and steel pipe conduit and two principal tunnels, the Olmstead approximately 0.7 miles long and the Alpine-Draper approximately 2.85 miles in length. The Provo Reservoir Canal is of standard cross section, with three concrete siphon structures and one concrete flume. By the end of 1945, the status of construction on these features was as follows: tunnels completed; concrete pipe sections of the aqueduct 92 per cent completed; manufacture of steel pipe sections being expedited since release of material by WPB; the contract portion of the reservoir canal is 80 per cent completed.

Rapid Valley Project—South Dakota.—Construction of Deerfield Dam was nearly completed at the end of 1945. This dam is an earth and rock fill dam, approximately 128 feet high and 830 feet in length, creating a storage reservoir of 15,000 acre-feet capacity for supplemental water supply for irrigation and municipal use by Rapid City, South Dakota.

Rathdrum Prairie Project—Idaho.—The Post Falls Unit of Rathdrum Prairie Project will supply irrigation water for approximately 3,500 acres. A pumping plant located on the Spokane River a few miles west of Coeur D'Alene pumps water from the river 160 feet to a 42-inch diameter banded wood-stave discharge pipe line which feeds the project canal. Construction of the pumping plant was started during March, 1945, and was completed in July. Work on the canal and lateral system was started in May, and all construction will be finished early in 1946.

Tucumcari Project—New Mexico.—About 25 miles of the Conchas Main Canal were completed. The work included the excavation of approximately 2,100.000 cubic yards of material for the canal prism, 11 concrete siphons of 11 ft. 3 in. diameter; two 11 ft. 3 in. diameter tunnels with total length of 10,154 feet and miscellaneous minor canal structures.

Yakima Project — Washington, Roza Division.—Construction on this project continued throughout 1945; to serve ultimately 72,000 acres of land, 47,000 acres by gravity and 25,000 by pumping. The major work on this project was the completion of the 95-mile main canal and laterals to place 42,000 acres under irrigation. Construction of laterals for 5,000 additional acres in progress; also preliminary survey work on the 25,000 acres to be served by 16 or 17 pumping plants located at appropriate points along the main canal.

CORPS OF ENGINEERS, U. S. ARMY

While not in the province of this review, mention should be made here of the magnificent war accomplishments, at home and abroad, in combat and behind the lines of the Corps of Engineers. These accomplishments only add luster to an already notable history. As far as civil works construction is concerned they, as well as other agencies, have been busy with investigations and surveys in connection with the proposed Missouri River Valley development. Their current civil works projects already under construction remained at a virtual standstill during a major portion of the year in accordance with existing Federal policies. The dam and reservoir projects on which construction work was performed are the Denison, Norfork, and Barker projects. Descriptions of those projects are contained in the following paragraphs.

Barker Dam—Texas.—The dam is located on Buffalo Bayou west of Houston, Tex., and south of Texas State Highway No. 73. It is an impervious earth-fill structure 72,844 feet long rising to a height of 37 feet at its maximum section across Buffalo Bayou. The outlet works through the dam consist of seven precast concrete culverts eight feet in diameter, two of which are equipped with control gates. The dam and rectification of the Buffalo Bayou channel below the dam were essentially completed during the year.

Norfork Dam — Arkansas.—The dam is located on the North Fork River about 4.8 miles above its confluence with the White River near Norfork in Baxter County, Arkansas. The project includes the construction of a concrete gravity dam 2,624 feet long and 220 feet high forming a reservoir with a storage capacity of about 732,000 acre-feet for flood control and about 1,251,000 acre-feet for power generation and stream flow generation. The dam consists of a spillway section 508 feet long located above the existing river channel and two non-overflow sections contiguous thereto, which extend to the abutments. Because of war conditions, temporary concrete bulkheads were installed on the spillway section in place of the proposed steel tainter crest gates. Gate-controlled conduits through the base of the spillway section provide for regulating and discharging flood flows. Four pinstocks for power generation are also included. The dam and powerhouse were completed in March 1945 under a continuing contract, and one 35,000 kilowatt power generating unit was placed in full commercial operation. Work performed during the year included the excavation of 61,891 cubic yards of rock, the pouring of 52.011 cubic yards of concrete, and the placing of 539,829 pounds of reinforcing steel.

Denison Dam (Lake Texoma)—Texas and Oklahoma.—The dam is located on the Red River approximately five miles northwest of Denison, Tex. The project provides for the construction of a rolled earth-fill dam 15,200 feet long rising 165 feet above the stream bed and creating a reservoir with a storage capacity of 2,690,800 acre-feet for flood control, 1,813,800 acre-feet for power, and 1,211,100 acre-feet for silt deposit. During the year, the construction of access roads and transmission lines to the powerhouse was completed. The installation of powerhouse equipment also was completed with the exception of certain items deferred as a result of the war emergency. Highway, railroad, and utility relocations were continued, including the construction of necessary bridges.

LOCAL PROTECTION PROJECTS

Miscellaneous.—Construction work was initiated on a channel improvement and levee project along Lytle and Cajon Creeks, California, to protect the San Bernardino and Colton areas and vital Pacific coast railroad facilities from flood damage. Work was continued on the improvement of the Vermilion River, Louisiana, the local protection projects at Tulsa, Oklahoma, the East Peoria Drainage and Levee District, Illinois, and Jeffersonville and Clarksville, Indiana, as well as on the large projects authorized separately for the alluvial valley of the Mississippi River and for the Sacramento River, California. Construction work was resumed on four projects in the Ohio River Basin, which were suspended during the war, to provide local flood protection for the cities of Evansville, Ind.; Paducah, Ky.; Portsmouth-New Boston, and Cincinnati, O. The raising of existing levees along the Mississippi River between Alton and Gale, Ill. was also resumed.

Lytle and Cajon Creeks, San Bernardino County, California.—The project provides for the construction of approximately 48,000 linear feet of non-continuous earth-filled and stone-faced levees and groins between the canyon mouths of Lytle and Cajon Creeks and Foothill Boulevard, the construction of a concrete channel extending along the west branch of Lytle Creek from Foothill Boulevard to Warm Creek (a distance of 14,575 feet), the construction of an inlet section upstream from Foothill Boulevard, the use of the existing east branch of Lytle Creek to carry by-passed flood flows, and the construction of four railroad bridges over the concrete channel.

Tulsa and West Tulsa—Oklahoma.—The project provides for raising the existing left bank levee along the Arkansas River, connecting the discontinuous portions of the levee and constructing a leveed floodway up Black Boy Creek with levees and diversion ditches eastward and westward thereof, raising the existing Arkansas River right bank levee to the proposed grade, and constructing necessary appurtenant works. During the year, the levee from Sand Springs to Black Boy Creek was placed in operation. Construction of the Black Boy floodway structure was completed, including the excavation of 5,436 cubic yards of material, and the placement of 733 cubic yards of concrete, 68,000 pounds of reinforcing steel, and 42,198 cubic yards of earthfill. The levee from Black Boy Creek to Tulsa was completed by the placement of 428.311 cubic yards of fill material, 1,057 cubic yards of concrete, and 23,704 pounds of reinforcing steel. Construction of the two required pumping plants for this portion of the project was substantially completed. The West Tulsa levee was completed by the placement of 393,790 cubic yards of fill material, 2,108 cubic yards of concrete, 128,390 pounds of reinforcing steel, and the construction of 174 linear feet of concrete floodwall. Construction of the two pumping plants required for this portion of the project also was substantially completed.

FLOOD CONTROL WORKS

As a result of major flooding which occurred during 1944 and 1945, the Corps of Engineers carried on an extensive program of emergency flood control work to repair levees and other flood control structures damaged by the floods to restore protection to threatened areas. The great majority of the flood damaged structures were constructed by local people or organizations and were of insufficient grade and section to withstand the crest stages resulting from the large floods occurring on many of the principal streams throughout the United States. During the floods, personnel of the Corps of Engineers directed and executed pre-arranged programs of flood fighting and rescue work in the affected areas.

NAVIGATION AND RELATED PROJECTS

Floodgates on the Gulf Intracoastal Waterway — Texas.—Construction of sector type gates at the

Colorado River crossing of the Gulf Intracoastal Waterway to prevent shoaling of the waterway during times of flood on the river was completed. The structure consists of two gates with a control house, and power control and lighting system for each floodgate.

Mississippi River between the Ohio and Missouri Rivers.—Construction work to regulate and stabilize the navigation channel was carried on throughout the first half of the fiscal year ended June 1945, the work during the last half of the year having been curtailed owing to high river stages. Twenty-five permeable dikes totaling 9,355 feet in length, and two revetments, totaling 2,155 feet in length consisting of 2,155 squares of mattress and 584 squares of paving, were constructed at various localities along this reach of the river. Open river regulating works are now about 70 per cent complete.

Missouri River between Kansas City and the Mouth.—Three revetments, totaling 2,548 linear feet, were constructed at various localities along this reach of the river. The existing project was about 88 per cent complete at the end of the fiscal year.

Missouri River between Kansas City and Sioux City.—The construction of revetment totaling 945 linear feet and the removal of 549 linear feet of old mattress and dike structure in connection with this revetment construction was undertaken in this reach of the river. The entire project for this reach was approximately 81 per cent complete at the end of the fiscal year.

Missouri River at Fort Peck—Montana.—Construction of a 15,000 KVA substation was completed in the power plant, and operation of the 35,000 KW generating unit was continued during the major portion of the year, the total power production being 84,334,630. Permanent work on the entire project at Fort Peck is approximately 95 per cent complete.

St. Marys River—Michigan.—Construction of a 1,200-foot extension to Southwest Pier was in progress during the fiscal year; 1,435 cubic yards common excavation were removed, 51,179 cubic feet of timber framed, and other preparatory work accomplished including a temporary railroad siding approximately 2,500 feet long.

Work on the reconstruction of Brady Pier was in progress during the fiscal year, 61,200 cubic yards of common excavation were removed, 137,717 square feet of steel sheet piling and 21,392 linear feet of wood piling were driven and 10,280 cubic yards of cell fill were placed.

The improvement and reconstruction of South Canal was completed during the year. A cofferdam was constructed across the South Canal, 878 linear feet of new concrete pier wall along Southwest Pier was constructed; movable dam sill in South Draw and electric service tunnel across South Canal were removed to a depth of 27.0 feet below low water datum; 9.544 cubic yards of concrete were placed, 1,561 cubic yards of common excavation, and 15,571 cubic yards of rock excavation were removed.

BUILDINGS

In the construction of buildings as elsewhere in the construction industry war shortages created limitations to progress, and an important part of the industry's efforts during 1945 were devoted to the conception, design, and preparation of plans for future projects. However, it should be borne in mind that such progress in planning means the employment of a large group of relatively highly paid specialists—engineers, designers, draftsmen, etc.—so that planning alone involves a considerable capital investment.

CONSTRUCTION FOR MANUFACTURE OF ATOMIC BOMB

The buildings and miscellaneous structures needed for the manufacture of the atomic bomb were actually completed during 1943. Since those achievements were not announced publicly until the latter part of 1945, they are quite properly recorded in this review. The magnitude of the project is difficult to visualize. It has been stated that if the volume of construction involved in the project had been reported during 1943, it would have increased the total construction volume for that year by 20 per cent. Plants were built at three points—in Tennessee, in Washington, and in New Mexico. The *Engineering News-Record* states: "From a construction point of view, the plants for production of atomic bombs are equal in cost and labor to building a Panama Canal each year for three consecutive years." Certainly the construction industry was able to add fresh laurels to those already gathered through its war efforts.

BUILDING DISASTERS

Two disasters which occurred to notable structures during the year are worthy of mention. On July 28, an Army B-25, Mitchell bomber, lost in a fog, crashed into the center of the north side of the 102-story Empire State Building in New York City—the world's tallest. This was at the level of the 78th and 79th floor. Thirteen persons were killed but a remarkably small amount of structural injury was done. Damage was confined primarily to the failure of secondary members in the locality of the point of contact. Total damage was estimated to be from $500,000 to $600,000.

During the hurricane of Sept. 15, the three blimp hangars at the Naval Air Station at Richmond, Fla. collapsed. The collapse was accompanied by fire caused by large quantities of highly inflammable gasolines and other material stored in the buildings. These hangars were among the more notable structures built by the Navy during the war, being 1,000 ft. long, 300 ft. wide, and 180 ft. high. The interiors were free of columns. Total damage to hangars and contents was estimated to be in excess of $30,000,000.

Structural failures such as these are looked upon as catastrophes particularly by those directly concerned but without exception such failures are fruitful sources of knowledge. Invariably, engineering thinking is stimulated by such failures into new activity in its search for knowledge regarding the action of structures under conditions of stress.

UNUSUAL BUILDINGS

One or two examples of unusual buildings completed during the year will be of interest. There was built near Sacramento, Calif. a three-hinged arch truss airplane hangar of light weight cold-pressed steel. The building is 222 ft. wide by 200 ft. long with an arch span of 167 ft. 6 in. and a rise at the center of 46 ft. 6 in. There are two side lean-tos, each 21 ft. 6 in. in width. The structure was designed to permit easy dismantling and reassembly and is characteristic of a development which has taken place in the use of light weight cold-pressed steel sections during the last two or three years.

A double aisle three-hinged arch structure using glued laminated wood I-sections for the arch ribs was built on the west coast. The overall horizontal dimensions of the building are 248 by 740 ft. consisting of two aisles spanned by 120 ft. arches with a rise of 72 ft. The arch ribs are of I-sections built up of thin boards glued together and bent to conform to the shape of the arch axis. This is an interesting and notable example of a development which has occurred over a period of 25 years but which has been given increased impetus during the war period.

BRIDGES

General.—In a discussion of progress made in bridge construction cognizance should be taken of the types and methods of erection which have been developed by the army engineers for establishing temporary as well as more permanent river crossings. Notable examples are the Bailey bridge developed by a British engineer but widely used by all of the Allied armies, and the Demountable V-type Bridge developed in the United States. While the development of these military bridge types will no doubt improve the art of bridge building generally, their actual usefulness for peacetime purposes will be quite limited.

As was the case in 1944 bridge construction for civilian purposes was restricted by wartime requirements, shortages of materials and labor, etc. However, there are several examples worthy of inclusion in this review.

Pecos River Bridge.—Among the more interesting of this year's bridges is the new Pecos River Bridge which carries the Southern Pacific Railroad over the Pecos River near Langtry, Tex., just north of the Mexican border. It replaces an old wrought-iron structure built in 1891 which was for many years the world's highest railway viaduct. The new bridge is of the continuous cantilever type with two-span continuous trusses on either side supporting a suspended span over the main channel. The superstructure was designed for the heaviest conventional railway loading using medium carbon steel throughout. The overall length of the structure is about 1,400 ft.

Santa Fe Bridge at Topock, Arizona.—The Santa Fe Railroad placed in service a new double-track bridge over the Colorado River on March 7, 1945. The structure consists of simple span deck trusses on concrete piers which are supported on reinforced concrete cylinders carried through unstable material to solid rock formations. The main crossing is made up of two spans each 350 ft. in length with parallel chord Warren type trusses 46 ft. deep.

Harry S. Truman Bridge.—The Harry S. Truman Bridge, crossing the Missouri River at Kansas City, Mo. and opened to traffic on June 1, 1945, was built jointly by the Chicago, Milwaukee and St. Paul and the Chicago, Rock Island and Pacific railroads. The bridge has a total length of 2,633 ft. consisting of a series of simple truss spans and girder approaches with a notable 420 ft. vertical lift span to accommodate river traffic.

MECHANICAL ENGINEERING

By Arthur M. Greene, Jr.

Dean Emeritus, School of Engineering, Princeton University

The year observed V-E Day on May 8, 1945 and V-J Day on Sept. 2, 1945 and with them the publication of many developments which were withheld by voluntary censorship during the war years. However, the technical publications throughout the year furnished the information for this section of The American Year Book.

EDUCATION AND TRAINING

The departments of Mechanical Engineering which had civil enrollments of about ten per cent normal were used by the Army and the Navy for the education of properly prepared draftees in specialized courses planned by them for the ground work for subsequent training given by the services in their own specialties. By the end of the year the number of civilian students increased through the return of discharged servicemen to resume their education or to begin their education in engineering.

The Engineering, Science and Management War Training program, beginning in 1942, was inaugurated in October 1940 as Engineering Defense Training and expanded into Engineering, Science and Management Defense Training in 1941 by including chemistry, physics, and production supervision. It completed its work in June 1945. From Dec. 9, 1940 to June 30, 1945 during which it reduced the shortages of engineers, scientists, and management supervisors, the program gave courses to 1,795,716 trainees at a cost of about $40 per course. These courses were given on college campuses and at other locations in or near industrial plants; they covered chemistry, physics, production supervision, draughting, map plotting, engineering, and inspection. The number of women of the total was 15.6 per cent, Negroes 1.4 per cent, members of the armed forces 2.1 per cent and veterans 0.8 per cent.

There were 42,568 different courses given by 227 institutions during the five years, most of which were for part time although 6 per cent of the enrollment was for full time courses. The engineering courses amounted to 75 per cent of those given to 75 per cent of the trainees, chemistry courses amounted to 3.0 to 2.1 per cent of the trainees, physics courses 2.0 to 1.8 per cent of trainees and production supervision 20.0 to 21.1 per cent of trainees. Industry and education have expressed their satisfaction in these courses for the preparation or upgrading of professional and semi-professional men required by the great expansion of production during the war.

A number of industrial companies are continuing and installing special courses in management education so that those taking the courses may coordinate the work of specialists.

EMPLOYMENT

The War Manpower Commission has arranged with 32,000 establishments for Veterans Apprentice Training Service to care for returning members of the armed services.

Civil employment reached 53,079,000 in 1943 while in 1944 it was reduced to 52,000,000, and the peak government civil employees reached 6,100,000 in December 1944. The total in civil, governmental, and armed services totaled 63,072,000. The total of all government employees was 28 per cent of the total number of gainfully employed persons. The civil employment of 51,500,000 in January 1945 is expected to drop to 46,000,000 by December.

POWER PLANTS AND EQUIPMENT

The total power developed in the United States is estimated at 1,250,000,000 horsepower of which 950,000,000 horsepower is used by automotive vehicles, 88,000,000 by steam locomotives and 72,000,000 by agriculture equipment. The prime mover capacity of power plants is 75,000,000 horsepower.

The Harbor Steam Plant for the city of Los Angeles designed to work in parallel with the hydro power plants of that region and take full load of 65,000 kw from a spinning load of 5,000 kw in case of hydro failure, was tested late in 1944 to obtain boiler performance on such a sudden increase of load. The steam demand for the 5,000 kw spinning load is 60,000 lb per hour and this must increase to 675,000 lb per hour. In the design, 25 seconds were allowed for the fans to speed up and the oil or gas burners to reach maximum output. In this time 3,500 cubic feet of water flashed into steam as the pressure dropped from 1050 psig to 937 psig which delivered at the rate of 630,000 lb per hour. This required the storage of 3,500 cubic feet of boiler water in large submerged drums in the setting and upper drums because of the swell of the water on this reduction of pressure. To insure dry steam, a steam drum was placed 15 feet above the normal water level. A steam scrubbing element was also used. To maintain circulation within the boilers the most direct flow was provided in the tubes. On account of temperature changes in the increase of load, expansion was permitted by overhead supports of superheaters and water walls. The burners were built so that the 10 burners in operation in stand-by condition using 4,300 lb of oil per hour could burn 69,000 lb per hour within 25 seconds.

The test showed that it took 12 minutes to establish normal conditions in place of 72 seconds from calculation. There was a 9-inch change in water level instead of a 7-inch change, as the pump regulator operated rapidly. The pressure drop and decrease in superheat were less than the expected amounts. The boiler efficiency was 88.4 per cent when the generator delivered 50,203 kw and 87.4 per cent at 74,037 kw. The 65,000 kw turbine is the largest 3,600 rpm tandem turbine built operating at throttle condition of 850 psi-900 F and will deliver a maximum of 75,000 kw. The consumption at turbine is 10,457 Btu per kwh and a net of 10,962 Btu per kwh.

The pooling of power during the war to increase the output for war industries was carried out by the utilities without the control of the Office of War Utilities. The five pools varied from 3,000,000 to 11,000,000 kw. These were the New York, New Jersey, and Maryland Pool, the South East Pool, the East Central Pool, the South West Pool, and the Pacific North West Pool. The East Central Pool, the South East Pool, and the South West Pool formed a super pool of 21,000,000 kw.

The largest automatic electric heated boiler for 150,000 lb of steam per hour, used 50,000 kw of energy. It is used at an alumina plant at Salem, Ore.

HYDRAULIC POWER

A 30,000 hp. impulse turbine under 1,150 feet head at Glenville, N. C. gave a peak efficiency of 88.9 per cent.

A new dam 118 miles up stream from Boulder Dam is being planned. This is known as the Bridge Canyon Dam and will form a lake 80 miles long impounding 3,700,000-acre feet. The power from this dam will total 750,000 kw, bringing the total of the Colorado River to 2,417,300 kw. The dam will be 736 feet high with a spillway capacity of 400,000 cfs.

GAS TURBINES AND INTERNAL COMBUSTION ENGINES

One of the theoretical papers of the year proposes the use of air shunted from the compressor discharge of a gas turbine around the combustion chamber for the cooling of the parts of the turbine rotor which are subject to both high stress and high temperature. This air is delivered by one group of nozzles immediately following the hot nozzles and supplies compressed but cooler air than that from the combustion space. Such cooling permits the use of air at 1,500 F from the main nozzle. With 75 per cent recuperation and a pressure ratio of 6., the estimated thermal efficiency is 36½ per cent while with all gas at 1500 F it would have been 38 per cent and with 1200 F gas, 31 per cent. This analysis was made for a unit made of a two-stage compressor with intercooler, a generator for heating, a high pressure and a low pressure turbine, and a recuperator.

A gas turbine laboratory has been planned for the Massachusetts Institute of Technology to be operated by aeronautical, chemical, mechanical, and metallurgical engineers to study all phases of design and application of this prime mover. It will be equipped with a supersonic wind tunnel and equipment for research on compressor and combustion devices, jets and gas turbines under controlled conditions.

The report on 26 gas turbines used on the Houdry gasoline units indicates that 20 of these have been built by Allis Chalmers and six were imported from Brown Boveri and Co. These handle 23,000 or 40,000 cfm except one which uses 60,000 cfm. The 26-stage axial compressor discharges 40,000 cfm at 45 psi. This is supplied at 950 F to a five-stage reaction turbine developing 6200 hp at 5180 rpm. Stainless steel turbine blades and nickel steel compressor blades are used. The experiences of the Sun Oil Company on several units from 1936 to 1943 covers 9,258 operating days out of 9,437 days. The 179 days lost were owing to 28 bearing failures (101 days), six lubrication failures (28 days), four blade failures (19 days), one air seal failure (3 days), three explosions (12 days), and three miscellaneous failures (16 days).

The Elliott Company, in cooperation with the U. S. Navy, has developed and built a 2500 hp gas turbine for naval service. This was formally demonstrated on July 23 and 24, 1945. In this prime mover weighing 30 lb per hp and requiring 3½ cubic feet per hp and with an overall efficiency of 29 per cent, 12,500 cfm of air is compressed to 43 psi and 300 F in a Lysholm screw compressor and then intercooled before entering the high pressure screw compressor which delivers air at 96 psi to the regenerator heated by exhaust gases. After passing through the high pressure combustion chamber the air enters the high pressure turbine at 1230 F in which it develops power for the low pressure compressor by expanding to 53 psi. It then passes through the low pressure combustion chamber where it is heated to 1207 F for the low pressure turbine. The low pressure turbine generates 5,000 hp by expansion of the air to a point slightly above atmospheric pressure of which one half of the power is used for the high pressure compressor, leaving 2,500 hp for ship propulsion. The exhaust of this turbine is passed through the regenerator which heats the compressed air and is exhausted to the ship funnel at 400 F.

The temperatures and the temperature ranges in adjacent parts have presented many problems of expansion, corrosion, fatigue, heat transfer, heat shielding, and cooling. The arrangement of the unit with two independent compressors, each driving one of the compressors and two combustion chambers, has been determined by the need for variation of output. By regulating the fuel flow to the high pressure combustion chamber, the speed of the low pressure compressor and thus the amount of air taken in by the screw is varied while the temperature in the entrance of the main low pressure turbine is maintained constant by regulators.

The new Cooper-Bessemer tubocharged Diesel Engine has a thermal efficiency of more than 40 per cent compared with the former maximum of 36 per cent.

The Worthington Co. and the Cooper-Bessemer Co. have continued the development of Diesel Engines in which oil or gas may be used for fuel. The change from one to the other can be made in a single revolution of the engine.

BIG INCH GAS LINE

A 24-inch pipe line of 1,180 miles with 85 miles of 20-inch pipe from a dehydrating plant at Corpus Christi, Tex. to Cornwall, W. Va. has been completed for the delivery of fuel gas into existing gas systems. It follows a great circle route and contains seven compressor stations spaced at intervals of 85 to 170 miles. The capacity is 207,000,000 cubic feet per day but it may be boosted to 262,000,000 cubic feet. River crossings are made by suspension of the line although the Mississippi is crossed by using an existing bridge. The gas is dehydrated to a new point of 30 F and is compressed to 750 psi for delivery to line in which it is reduced to 401 psi on reaching the next compression station. These stations have 9-1000 angle type compressors.

ARMY WATER SUPPLY

For the drilling of wells for the water supply battalions in the war zones, groups of men were trained near Kingman, Ariz. for periods of eight weeks for experienced drillers and of 32 weeks for inexperienced men. Both rotary and percussion drills were used. Although the former type is more expensive, it was to be used in new terrain as it does not tend to freeze in striking shale, clay, or quicksand. The drill rig was driven by a 35 hp—1600 rpm gasoline engine. To remove loosened material a fluid mud was pumped in during drilling and this served to seal off porous sections of the well. After the drill is removed, a screen is set, the well is cased, washed out, baled out, and the deep well turbine pump is set. In usual cases it took about five hours to complete a well which would pump enough water for one division.

HEATING AND VENTILATING

The use of radiant heating is increasing. Tests indicate that rugs on floor panels and pictures over wall panels do not affect the efficiency of the system. They also indicate a reduction of 35 per cent in the amount of heat supplied to the system although there is an increase in the heat loss to the ground. At Purdue University, a "field laboratory" has been erected to obtain data from full size equipment to give a more accurate evaluation of present design methods.

The electrothermic system of heating and air conditioning uses storage tanks with rock or water storage so that heat from electric energy may be stored from off peak power for use during the remainder of the day.

To test the application of sun heat, two full scale test houses have been built beside each other on the campus of Purdue University. In one, two-thirds of the south wall is built of glass; the other house is of standard construction to act as a control.

AIR CONDITIONING

Air conditioning has been found essential in 200 industries, including those for chewing gum, drugs, glass, paper, printing, synthetic rubber, and textiles.

The air conditioning of flat top windowless black-out types of buildings for war contracts has shown that such structures cost less per square foot of manufacturing space for heating and air conditioning than conventional monitor top factory buildings with windows. It has shown that men can work to closer tolerances without the etching of parts or gauges by perspiration through humidity control. Good lighting makes more accurate guage readings possible, while uniform temperature makes gauge readings the same at all locations. At one plant of 1,000,000 square feet the heating, ventilating, and air conditioning cost $250. per ton, a total of $1,120,000. Of this amount 20.0 per cent was for refrigeration, 29 per cent for air handling, 20.4 per cent for sheet metal, 5.85 per cent temperature control, 4.5 per cent for heat exchanges and cooling towers, 6.85 per cent for piping, 2.15 per cent insulation, 0.52 per cent for instruments, 0.35 per cent for painting, 10.4 per cent freight, installation, supervision, overhead, profit and insurance.

The questionnaires answered by a large number of supervisors indicated an improvement in health, increase of efficiency and job satisfaction of employees, a reduction in absenteeism and labor turnover, a reduction in time per job, and a reduction in maintenance owing to absence of dust. There were some complaints, the most frequent was that of causing colds. Ninety-five per cent of the questionnaires indicated that this plant was an improvement over the conventional form of buildings, and 92 per cent stated that they would prefer to work in an air-conditioned plant.

A new laboratory for the General Electric Company of 200,000 square feet of laboratory space with an auditorium for 300 persons, a dining room, and conference rooms is to be built with air conditioning throughout.

The Bell Bomber Plant at Marietta, Ga., the world's largest bomber plant, is air conditioned to 85 F and 50 per cent R.H. requiring 82 units using 7524 tons of refrigeration driven by 7,550 hp of motors. There are 97 compressors, 82 supply fans, and 91 evaporative condensers using 1,435,000 cfm of air.

REFRIGERATION

The requirements of the Army and Navy were met by a number of storage plants during the year. The San Francisco Quartermasters Market Center is 187 feet by 610 feet and contains 11 rooms 63 x 137, three held at 30 F and eight at 10 F. It handles 100 car loads of foodstuff a day, including 80,000 carcasses of meats.

A refrigerated concrete barge for the South Pacific is 265 feet long with 48-foot beam. It contains 122,000 cubic feet of storage space. The deck house rooms are held at 32 to 36 F, while the holds are at 10 to 15 F. It is equipped to produce 500 gallons of ice cream per day and five tons of ice. A 400 Diesel engine-generator furnishes power for cranes and unloading equipment.

In the field the Army has one-ton gasoline driven ice machines. In the battle area 1½-ton refrigerating units with 52 cubic ft. boxes, weighing 3,000 lb, may be dropped from gliders or airplanes. Each Army mess hall is equipped with walk-in boxes of 6 x 6 to 10 x 30 area, while thousands of reach-in boxes of 20 to 80 cubic ft. are used in various locations. They have also refrigerated ships, railroad cars and warehouses. Most warehouses are prefabricated with 6″ walls of capacity of 615 cubic ft. to 1760 cubic ft. The refrigerating units are air cooled and driven by gasoline engines. These are mounted on semi-trailers. Other semi-trailers of 14,700 lb weight have a pay load storage of 10,000 lb and are held at 15 F in an air temperature of 120 F. Some of these are used for refrigeration of blood plasma, photographic supplies, and ice cream. The permanent warehouses are 20 x 52 x 52 and 20 x 100 x 13.

The largest Navy refrigerated warehouse in the South Pacific will store 2,500,000 pounds of meat at 10 F, 2,200,000 lb of fruits and fresh vegetables at 40 F, and 300,000 lb of dairy products with an outside temperature of 130 F. This contains 264 refrigerating units. The Navy ration is 1.31 lb of refrigerated meat and dairy products per day with 2.4 lb of fresh fruit and vegetables.

The Stratosphere Chamber at the Aberdeen Proving Grounds contains a steel vacuum chamber that can be brought to —70 F and 2.2 psi absolute pressure in 12 minutes to simulate conditions at 40,000 feet elevation. This is a drop of 140 F in temperature.

The world's largest low temperature refrigerating system for the laboratory of the National Advisory Committee on Aeronautics at Cleveland, operating between 59 F and —80 F, requires 7,500 tons of refrigeration. The equipment is driven by motors aggregating 21,000 hp.

RAILROADS

At the beginning of the year seven major railroads completed 30,000 miles of test runs on high frequency radio communications for train control for which the Federal Communications Commission has allocated several channels for this service. Throughout the year many roads added centralized train control to sections of their roads, increasing safety and movement of trains.

One hundred plywood box cars were built and 1,000 ordered for one railroad, saving 20 tons of weight per car. The first 50-ton aluminum box cars were reported in 1945.

A number of railroads altered older locomotives by raising pressures, rearranging running gears with roller bearings for main blocks, remodelling counter balance, and increasing capacity of tenders so that fuel consumption has been reduced, draw bar pull increased, and length of run between water and coal station increased.

The tests of the geared turbine locomotive of the Pennsylvania Railroad have shown it to have a higher traction effort than a piston driven locomotive of the same boiler capacity throughout its full range of speed and higher than a 6,000 hp Diesel locomotive above 35 mph. The turbine locomotive weighs less than the Diesel per hp (152 lb vs 200 lb). By the use of smaller wheels a larger boiler may be used, and its smaller wheel base permits the use of a larger grate. The torque on the shaft is uniform.

The C. and O. R.R. is adding a steam turbine electric drive locomotive to its equipment of 4,000 kw capacity.

On June 30, 1945 there were 3,202 Diesel locomotives in service. Of the 2,791 used by Class 1 railroads, 642 in road service had a total of 2,047,590 hp and 2,149 in switching 1,725,038 hp. During the first six months of the year, 270 new locomotives were added, 25 of which had capacities of 5,400 hp. The New York, Susquehanna and Western Railroad has abandoned its 41 steam locomotives and replaced them by 6-1,000 hp switching Diesels and 10-10,000 hp road Diesels on its 41 miles across New Jersey.

The welded boiler which was permitted the Delaware and Hudson R.R. in 1938 has developed no cracks or flaws in any of the welded seams or in the parent metal. It was originally operated for six weeks as a stationary boiler, then as a locomotive with examinations every three months for a year, then at six months for a year. Subsequently there have been five yearly inspections. During this period the Interstate Commerce Commission permitted 215 partially welded boilers, and it has now granted permission for one fully welded boiler to the D. and H. for a 4-6-6-4 locomotive and to the N. Y. Central for a 4-6-4 locomotive.

The use of power switch control, car retarders on tracks, and telephonic communication has speeded up the time use in classification yard for separating cars by 25 per cent.

Steam-air jets to consume smoke have been added successfully to locomotives of 18 railroads.

The trial runs for three years of the four-cylinder 4-4-4-4 type locomotives of the Pennsylvania R.R. has led to the construction of 50 of the locomotives. Twenty-five have been ordered from the Baldwin Locomotive Co. and 25 will be built by the railroad. These locomotives will run between Harrisburg, Pa. and Chicago, a run of 713 miles with one refueling at Milbrook, O., 385 miles from Harrisburg. The first engine ran with a 1,000-ton train and attained a speed of 100 mph although designed for 880 tons at this speed. They have made runs of 1,800 miles. The use of four cylinders, each driving two axles, permits small bores, reducing the piston thrust, and eliminates heavy complicated side rods and moving parts. The strokes also can be shorter with lower piston speeds and higher m.e.p. These locomotives, like other new ones, weigh almost 500,000 lb.

MANUFACTURING

The Pennsylvania Railroad is forming some locomotive cylinders by welding to replace the customary casting. By efficient tool control at such plants as those of General Motors, waste time and material have been reduced. Correct tools with proper sharpening are always ready for exchange of dulled equipment. Induction heating by low frequency and high frequency currents for surface hardening, heating, and brazing was extended during the year.

Shot peeding by increasing the fatigue resistance of a thin surface layer of material five to 10 thousandth of an inch in thickness places the outer fibers in compression and the inner ones in tension so that the life of hypoid gears of General Motors Corporation have been increased 600 per cent, aircraft crank shafts 900 per cent, steering knuckles 475 per cent, transmission shafts 520 per cent, and helical springs 1370 per cent.

Machine parts for overseas shipment have received two coatings of a molten, semi-transparent, pliable, highly viscous synthetic plastic and mineral oil which is easily removed when the parts are utilized.

MANHATTAN (ATOMIC BOMB) PROJECT

The Manhattan Project has yielded, in addition to its weapon of destruction, 5,000 new products or procedures for peacetime application. Among those of interest to the mechanical engineer are improved protective methods of combatting toxicity in industry, new methods of protecting metal from corrosion, new coolants, new types of heat exchangers and piping, new pumps and packing, and new control instruments and procedures.

MATERIALS

Flotofoam, a synthetic plastic, is made of light weight by foaming so that when solidified it weighs ¾ lb per cubic foot. It is used as a heat or sound insulation. Fiber glass, another insulator of earlier development, weighing 6/10 lb per cubic foot, has been used extensively as a fabric in the Army and on ships in the form of boards and blanket rolls or batts. At times it may be so made that it weighs 1.5 to 9 lb per cubic foot. It may be used at 1,000 F. A heavier insulator "foam glass" weighs 10½ lb per cubic foot. It is used in the flexible sheet form, ½-inch thick on aircraft. In addition, it may be used for air filters, retainer mats in storage batteries, and to protect underground pipes from corrosion and electrolysis. It may be used for insulation in electric apparatus.

An aerated latex or synthetic rubber, known as airfoam, is used for seat cushions. The load carrying capacity of this substance is regulated by the amount of aeration.

Staypak is the name given by the U. S. Forest Products Laboratory to a plywood which has been treated with high moisture content during its compression to a point which causes the flow of the legrim or cementing material between the fibers. It will swell appreciably when released but return to its compressed thickness on drying to its original moisture content. The plywood is made up of veneers with glue, compressed to 2,000 psi to make a heavy wood of 1.39 sp g, and of high impact and tensile strength. Its bending modulus of rupture is 20,000 psi. It may be used for propellers, spars, fitting, wood handles, mallet heads, pulleys, silent gears, jigs, dies, and water lubricated bearings.

The steel making capacity of the United States increased from 82,000,000 tons in 1940 to the present 95,000,000 tons per year, and during the first part of the year production was from 91.5 to 96.5 per cent from weekly reports except in the first two weeks of February in which production fell to about 87½ per cent because of the severe cold weather. The coal strikes of the early fall cut production to 65.5 per cent for the week of Oct. 16 and by Oct. 30 it had risen to 74 per cent.

High strength alloy steels, which may be used in structural parts at 1,000 F to 1,600 F, were developed by the Allegheny-Ludlum Steel Company.

Inoculants of alloys of various percentages of Si, Ni, Mn, Al, Ti, Zr, Cr and C are added to the ladle of grey cast iron to reduce chill and promote machinability without reducing strength and roughness. The amount added is one to two per cent of ladle charge, and this material is not believed to alloy with the cast iron. It increases the strength but reduces the defection of the metal.

Steel castings have been made by the Thermit Process "Thermocast," yielding 25 lb of steel from a mixture weighing 45 lb. The tensile strength of the casting is 70,200 psi with a yield point of 39,250 psi. The elongation in two inches is 30.1 per cent, and the reduction in area 51.2 per cent.

Sponge iron, the manufacture of which was thought would care for the lack of scrap iron, was made at an experimental plant at Warren, Ohio, costing more than $1,000,000. The results from 2,000 tons charged into this pilot plant have not indicated the probable cost of producing this material.

Pliobond is an all-purpose adhesive cement developed by the Goodyear Tire and Rubber Co. for metals, plastics, fabric, ceramic ware, vulcanized rubber, paper, glass, plaster, wood, and concrete. It is applied by a brush, sprayer, or roller coater.

Meltbond, an adhesive developed by the Vultee Aircraft Corporation in the form of a liquid, paste or tape, is of four types, differing in pressure and temperature for curing. This adhesive is used for the leading edges of wings and between aluminum and steel to prevent electrolysis or between aluminum and magnesium to prevent corrosion.

Boron carbide B_4C made by the Norton Co. under the name "Norbide" is an abrasive next to diamond in hardness. It is lighter than aluminum and its moulded strength is 30,000 psi.

Cerrobend, a material consisting of 26.7 per cent lead, 13.3 per cent tin, 10 per cent cadmium, and 50 per cent bismuth, is used in temporary tooling for dies and other tools by the Lockheed Aircraft Corporation. It melts at 160 F and below 215 F. It has a tensile strength of 6,000 psi, 200 per cent elongation, 9.2 Brinell hardness. It is malleable but brittle to hard blows. It expands on cooling and is used to fill pipes which are to be bent as it may be removed by melting in boiling water. A punch of this material weighing 12,000 lb was used with a similar die of 10,000 lb in a drop hammer to form 1 to 100 parts.

Cast iron classes of 20,000 psi to 60,000 psi have now been extended to

80,000 psi by improved melting, alloys, and heat treatment, while cast steels by melting technique, control of inclusion, and the use of deoxidizers have now been raised to 150,000 psi and a yield point of 125,000 psi. The chrome-molybdenum types with heat treatment have been raised to 205,000 psi. A new heat treated low carbon cast iron has a strength of 100,000 psi. It is more heat resistant than the former cast iron and may be operated at 650 F and with 2 per cent chromium to 1,400 F.

TESTING

The Buffalo Forge Co. has built a test pit of reinforced concrete to test centrifugal fans to destruction. It may be evacuated to one-three thousandth of an atmosphere so as to reduce windage losses and make it possible to spin a fan which would normally require 1,000 hp by a one quarter horsepower motor. The pit is similar to one used by the General Electric Co. for testing supercharges at 60,000 rpm. This pit, which is 72 inches in diameter and four feet deep, is lined with a laminated wood shield to receive broken parts. It is equipped to test dynamic balance, and with cathode ray strain gauges as well as stroboscopic lighting for visual study through a glass window in the cover.

Plungers and bushings for the fuel injection system are tested for accuracy to five millionths of an inch by air gauging equipment in which the master gauges are checked at hourly intervals. There are 16 sizes of plunger and bushing diameters which vary by five millionths of an inch.

To study the stresses in ruptured parts, grid lines of 10 per inch to 100 per inch are photographed on the part, and these lines are then studied after rupture to determine strain.

At Kure Beach, Wilmington, N. C., the testing of metals and surface finishes exposed to weather is being carried out as a joint project of the International Nickel Corporation, Carnegie Illinois Steel Co., Dow Chemical Co., and the Ethyl Dow Chemical Corporation. There are 15,000 specimens exposed to weather and spray from breakers on samples of different metals, on metals joined with others for galvanic action, riveted and bolted joints, bent pieces which are strained, on plates treated chemically or with paint or enamel protection. Some specimens are immersed in sea water.

The Association of American Railroads has made a voluminous report on 900 tests to study the static and dynamic effect on high speed steam and Diesel locomotives over short steel spans at from five mph to nearly 100 mph. Locomotive equipment and deck girder and beam bridges of different railroads were used. The lower speed was assumed to give static loading. The instruments measured strains to 1/150,000 inch occurring at 500 cycles per second. The actual stresses from wheel loads were 90 per cent of those computed for open track and 80 per cent for ballasted track. The effect of roll of the locomotive, speed, hammer blow, and track irregularities were studied. Roll of the locomotive increased the stress on one track with corresponding decrease on the other track. There was a critical speed for each locomotive at which the effect of counterweight was a maximum. This occurred at 20 to 40 mph for Diesel locomotives and at 30 to 50 mph for steam locomotives.

For testing surface finish of metal surface, the Bureau of Standards proposes to apply a thin strip of plastic film by pressure from a roller to the surface which has received a coat of solvent. After setting, the film is stripped and oscillated at 300 times per minute before a restricted light beam passing to a photoelectric cell. The pulsating voltage is recorded, and from calibration it is reduced to indicate finish. The tests of duplicate replicas show close agreement, and curves from different finishes are quite similar to those from other profilemeters.

INSTRUMENTS

The strobomeca, a spring driven stroboscope slightly larger than a baseball, has been developed to examine moving parts and to check speeds. It has been developed for ranges of 500 to 8,000 rpm and 1,000 to 16,000 rpm with a variation of 2 per cent of true speed.

A balancing machine has been built by Olsen to test Diesel Crank Shafts weighing 5,800 lb and of 15′-7⅝″ length.

The pressure graph is a linear pressure time curve indicator for internal combustion engines, pumps, air lines, and other similar structures which records static or dynamic pressures by means of pickup stations in cylinder or pipe. The pickup is amplified and transmitted to a cathode ray oscillograph for indication or recording.

Fluoroscopes, used for scanning manufactured parts, do not indicate small defects which are shown on radiographs, but when a rotational scanner is used medium and large defects not detected radiographically are clearly indicated.

Electronic inspection gauges are used in many plants using photoelectric cells to measure differences from gauge size. To check gauges at other plants a comparator enlarges contours 100 times for checking to two millionths of an inch.

ELECTRICAL ENGINEERING

By Harry Sohon
Advanced Development Engineer, RCA Victor Division,
Radio Corporation of America

NEW INSTALLATIONS AND PROJECTS

The South Carolina Power Company is planning to build a steam plant on the Ashley River north of Charleston. The plant will contain a 25,000-kva hydrogen-cooled generator. A single boiler will be used to produce 230,000 pounds of steam per hour at 850 psi and 900°F. Either coal or oil can be used for fuel. The project is expected to cost about $2,500,000.

The Bonneville Power Administration is to erect a high-capacity power transformer bank. There will be four 50,000-kva self-cooled transformers. These transformers, when operated with auxiliary forced air, are rated at 83,333 kva; therefore, three transformers can be used to give 250,000 kva and one transformer will be available as a spare. The transformers are single-phase oil-immersed for connection to the high voltage side in wye to 220,000 volts. There are remote-control motor-operated tap changers that work under load. Provision is made to connect the low-voltage windings 66,700 volts delta, 115.500 volts wye, and 13.200 volts delta. The estimated cost of the bank is $772,434.

The General Electric Company has selected a site at Tiffin, O. for a small-motor factory. This factory has been planned for some time as a post-war project.

Kentucky Dam of the Tennessee Valley Authority at Gilbertsville was dedicated by President Truman after being in use for about a year. The President said that the TVA "is no longer an experiment but a demonstration." "It is easy to see that most of these commonsense principles can be applied to other valleys, and I have already recommended to the Congress that a start be made in that direction."

Pennsylvania Electric Company has started construction of a 30,000-kw steam generating station on the Allegheny River. It is two miles west of Warren, Pa. and is expected to cost $4,000,000. It will burn coal. There are to be two boilers furnishing steam at 850 psi and 875°F. The boilers will produce 370,000 pounds of steam per hour.

The Ohio Edison Company is erecting a new substation at Barberton, O. It is rated at 60,000 kva. A 138-kv steel-tower line is to tap the Cleveland-Akron line about two and one half miles from Barberton.

Grand Coulee Dam power house is receiving three more 108,000-kw generators at $2,000,000 each. The two 75,000-kw units built for Shasta Dam but placed temporarily at Grand Coulee will be removed to Shasta as soon as possible. This will give Grand Coulee nine units. Eventually Grand Coulee will have 18 units. This dam was planned to supply irrigation water to the Columbia Basin Project lands.

The Reclamation Bureau's Boisé project near Boisé, Idaho, is to continue work on Anderson Ranch Dam on South Fork of the Boisé River. The powerhouse will contain two 15,000-kva generators driven by two 18,500-hp hydroturbines.

The Pennsylvania Power and Light Company is planning to build an anthracite burning plant on the Susquehanna River at Sunbury, Pa. The plant will contain two 70,000-kw turbogenerators. Four boilers will be provided to produce steam at 1350 psi.

The Potomac Electric Power Company has a new 50,000-kw steam turbine generating unit in the Buzzard Point plant. The total installed capacity is now 270,000 kilowatts.

The Wisconsin Power and Light has added a 25,000-kw hydrogen-cooled 3600-rpm generator. It is driven by a steam turbine operating at 850 psi and 900°F. Steam is generated at 275,000 pounds per hour. A 20,000-kva substation is provided to connect to the system.

A 25,000-kw hydroelectric plant costing $900,000 will be constructed three miles below Shoshone Dam in northern Wyoming. This is the Heart Mountain power development of the Bureau of Reclamation.

The California-Oregon Power Company has been given a permit by the Oregon Hydro-Electric Commission for the development of a $4,000,000 power project. It is to be on the North Fork of the Umpqua River in southwest Oregon. A dam is to be erected near Toketee Falls to provide 40,000 kilowatts.

The Pacific Gas and Electric Company will electrify nearly all farms and rural areas in its territory by the end of 1946. The project is expected to cost $6,000,000 and includes 1,200 new projects and 10,000 new customers in remote regions.

CONTROL

The Commonwealth Edison Company in Chicago is using grid-controlled thyratrons to control the governor motor on a 35,000-kva turbogenerator at Calumet station. Originally relays were used. The relays were often closed for only two-second intervals and as a result the relays were breaking the starting current of the motor. This resulted in burning the relay contacts and the relays were then replaced by contactors, which proved inadequate and were replaced by thyratrons. The motor is a series motor with two field coils. The armature is excited through one field by two full-wave thyratrons for motion in one direction. Another pair of thyratrons, connected full-wave, produces motion in the opposite direction.

A novel constant-speed device for aircraft alternators has been developed. It is desirable to connect the alternators on the various motors in parallel. Since the motors do not always turn at the same speed it is necessary to have some variable ratio device so that the alternator will run at the same speed while the motor speed may vary over a wide range. The system may be described as follows: The driveshaft operates a cam that pushes the driven shaft through the cam follower. By using several followers spaced around the cam, the driven shaft is given several pushes during each rotation. The velocity ratio is varied by varying the cam eccentricity. The eccentricity can be varied continuously, therefore the alternator speed can be kept constant for any motor speed. A similar effect is also obtained by using a hydraulic pump driving a hydraulic motor. The control is obtained by varying the displacement of the pump.

The milling of ships' propellers has been speeded up and simplified by automatic machinery. One device in use consists of a probe that follows the surface of a model propeller. The deflection of the probe compresses a silverstat that results in accelerating the drive motor that positions the cutting tool; at the same time it moves the following probe support through a train of gears to provide the desired ratio. The compression of the silverstat produces a voltage variation that is amplified in a direct-current amplifier. The accelerating voltage is supplied as long as the silverstat is deflected from its initial position. Accurate positioning is, therefore, obtained by making the driving motor tend to return the silverstat to its initial condition at all times regardless of the position of the probe. It was necessary to incorporate anti-hunting circuits in the amplifier so that the action could be speeded up. It is a simple matter to change the scale so that propellers of different sizes can be made from the same model with a minimum of adjustment of the machinery.

The recent trend in power factor control is to use capacitors on individual motors, but the problem is one that requires some planning. Synchronous condensers to keep the power factor at any desired value may be used in a large plant. However, a synchronous machine might not be within the budget of a smaller plant, where, for financial reasons, it might be preferable to install static condensers. If the static condensers are placed across the line, the power factor will be corrected only for a definite load. At other times the power factor would be low, sometimes leading as well as sometimes lagging. It would be possible to switch part of the capacitors out of the circuit for light loads, but a better plan is to correct each motor by a capacitor that is permanently connected across the motor terminals. When this is done, care must be exercised that the capacitance is not too great. If the capacitance is too great, it may provide excitation to the motor while it is coasting to standstill after the line switch is opened. Under these circumstances a voltage several times the line voltage might be induced which may endanger the insulation, and result in damage to the connected load or to the shaft coupling. If several motors are considered as a unit for power factor correction with the capacitors connected to the common line, a study of the fault possibilities must be made to ensure that the line is not disconnected from the system with only one or two motors connected. Any such disconnection will result in the difficulties discussed above where individual motors are overcorrected. It is generally recommended that a few large motors operating on higher voltages be supplied with individual capacitors. The smaller motors that generally operate on lower voltages should be corrected for power factor as groups rather than individually. These recommendations are made to keep the cost of equipment within reason and also to keep the equipment diversified. High-voltage condensers are smaller; for diversification it is common to have six windings on a motor so that it can be used on two voltages (for example, 220 volts and 440 volts), whereas capacitors are made for only one voltage. Hence such a motor would require two sets of capacitors unless it were taken care of as a part of a group of machines.

An anticipator tube is used to improve temperature control of furnaces. Its action is analogous to the heater placed in the home thermostat. The anticipator contains two thermo-junctions placed back to back which are connected in series with the control thermo-junction in the furnace. During the heating cycle a heater in the anticipator tube is energized, which heats one junction in the tube faster than the other junction. This gives a voltage that tends to turn off the heating cycle sooner. In the home thermostat the heater heats the temperature-sensitive element above what the ambient would do and thus turns off the furnace early to allow the room temperature to rise to the desired value without overshoot. During the cooling cycle the heater is not energized, but owing to the design of the anticipator tube, one junction cools faster than the other, which in turn is made to turn on the furnace sooner. The device has been found to make considerable improvement in furnace temperature control. Variations have been reduced from 25°F in one case to 2.5°F and from 2.5°F to 0.4°F in another case.

SWITCHGEAR

A 400-cycle circuit breaker has been developed for aircraft use, on the 208 Y/120-volt system adopted by the Army Air Forces. The new breaker is electrically operated by remote control and will interrupt 3,800 amperes at altitudes up to 50,000 feet. It is designed to operate over a temperature range of —40°C to +60°C and in a humidity of 0.5 to 100 per cent. The breaker operates at any altitude from sea level to 50,000 feet and will withstand vibrations of 0.030 inch from ten to 50 cycles.

Another recent development is a high-capacity high-voltage oil circuit breaker that will work in three cycles. The breaker will interrupt a load rated at 3,500 megavolt-amperes. After the circuit has been interrupted, the breaker will close in less than 20 cycles, thereby reducing the service interruptions and in many cases keeping the systems in synchronism. The effect is obtained with two sets of contacts. One set of contacts generates a pressure by the arc that forms as the contacts part. This developed pressure forces the oil through the other contacts to break the electric circuit at that point. A further provision is made in the design of the pressure forming contacts so that, when a heavy current is to be broken, the arc will move to contacts that will not permit the pressure developed to increase too much. Too great a pressure might cause the breaker to explode. By this design the breaking operation is fast over the full range of currents.

An air-blast circuit breaker has been developed that will interrupt a load of 3.500 megavolt-amperes, for use on 138,000-volt lines. The design causes the moving contact to move into a region of high pressure where the dielectric strength of the air is high to help break the arc. It also causes an air blast to blow the ionized gases (generated by the arc) away from the contacts; this assists in breaking the electric circuit. The time required to interrupt the circuit has been reduced to three cycles.

A new type of rectifier relay has been developed for transformer protection. Where a relay is used to supervise a transformer circuit, the relay must be desensitized when the transformer is connected to the line, or the inrush current will trip the relay. Since the inrush current is a displaced sine-wave current and not a symmetrical current of large amplitude, it is possible to connect two relays to rectifiers so that the relays operate on opposite halves of the current wave. In the case of the inrush current produced by the switching operation, only one relay would operate and the contactor would stay closed. It would require a high symmetrical alternating current to operate both relays, which in turn would open the contactor to protect the transformer from overload.

RECTIFIERS

Portable rectifiers are used to supply direct-current power to ships in dry dock; this means that when a ship is unable to drive its direct-current generators, it need not be without power for lighting and other services. The rectifier unit contains ignitrons mounted on a 25-ton trailer, 25 feet long by eight feet wide. The rectifiers and transformers are fluid cooled. The rectifier has distilled water that carries the heat to a heat exchanger whence sea water carries the heat away. A similar system is used for the transformers. Pyranol carries the heat from the transformers to a heat exchanger where it is given to the sea water. Either 250/125 volts or 125 volts are available at 500 kilowatts. The supply to the rectifier is three-phase.

The great electric power now demanded for use in airplanes makes it more efficient to use an alternating-current generating and distribution system rather than a direct-current system. Some loads can be run directly on alternating current, but others require direct current. For these latter loads a line of selenium power rectifiers has been developed. Ratings vary from 100 to 800 amperes. The usual connection is to use six rectifiers connected in two wyes. The center of one wye is made the positive terminal and the center of the other wye is made the negative terminal. Individual rectifiers are made up of a stack of cells in series. The number of cells in a stack is determined by the alternating voltage. Efficiencies up to 85 per cent have been obtained.

HEATING AND WELDING

Infrared lamps are being used to accelerate baking or drying of industrial finishes. These lamps can be used to evaporate solvents that have exceedingly low flash points, hence may be utilized in cases where open flames would be unsafe. It is becoming the practice to enclose the lamps, that is, to use a drying oven. In some cases the oven is shielded from drafts that might cool the material; in other cases the ovens are enclosed so that the oven air is changed only in controlled amounts to remove the evaporated solvents.

In order to stop the flicker on lights supplied by the circuits on which a welder is used, a "voltage translator" has been adopted. This consists of an impedance added to the line through a transformer so that the welding current will produce a voltage rise in the lighting-load line just equal to the voltage drop in the feeder produced by the combined load. This means that the voltage regulation on the welder is extra large, but it causes no difficulty.

Most systems using high-frequency heating provide that the article being heated shall be placed in the oscillator circuit. Hence the oscillator frequency, output, and efficiency are all affected by the size, shape, and material of the item being heated. In some cases the oscillator is designed with a sufficiently generous power rating for enough heat to be produced under the most unfavorable conditions. Hence, too much power is likely to be available under other conditions. A recent trend is to use an automatic matching circuit that automatically adjusts the oscillator circuit to ensure constant power which makes the most economical use of the equipment.

When the arc in an arc furnace is being struck by short-circuiting the electrodes, the high reactive current taken ordinarily produces a decided drop in bus voltage with corresponding flicker being imposed on all equipment connected to the bus. In order to reduce this effect, a setup is being tried whereby a transformer is used to supply a capacitor bus from the main line through an adjustable reactor. The furnace is connected through the high-reactance furnace transformer to the capacitor bus. The operation is then as follows: when the electrodes are short-circuited the main source of reactive current is from the capacitance instead of from the line, and this reduces the flicker. The equipment set up as described has been found very satisfactory in practice.

DISTRIBUTION

In the matter of distribution the Union Electric Company of Missouri has interconnected the alternating-current and direct-current systems so that a common neutral conductor is used. Since direct and alternating currents are added as though they were in quadrature, this has resulted in a considerable saving of copper. For example, if an alternating current and a direct current of equal effective values are both carried by the same conductor, 30 per cent less copper will be required than if the two currents were carried by separate conductors. With less copper required in the cables, less lead will be needed for the sheaths. In St. Louis, as a result of this interconnection, 138,000 pounds of copper and 150,000 pounds of lead were salvaged from the distribution system.

Another advance in the distribution of power has been adopted by the Chicago, South Shore, and South Bend interurban line. It is a reserve, direct-current substation, mounted on two railroad flatcars. One carries the direct-current switchgear and two rotary converters. The other car carries the transformer and the alternating-current switchgear. The transformer is rated at 1575 kva, 60 cycles. The primary voltage is 34,600. The secondaries are in two 555-voltwye connections, one for each rotary. Each rotary generates 750 volts and, when the machines are connected in series, 1,500 volts is available for connection to the line.

A lightning protection problem has been met by the Northern Indiana Public Service with a novel solution. Lightning strokes to the 135-foot tower destroyed circuit-breaker bushings on an 11-kv substation. This was in spite of the fact that oxide-film arresters were used for protection. When an ordinary line-type pellet was put in parallel with the oxide-film arrester, the equipment was satisfactorily protected. The explanation advanced is that the low-capacity pellet type arrester takes care of the steep wavefront, and the oxide-film type takes the main lightning stroke.

The Public Service Company of Northern Illinois has inaugurated an unusual procedure for work on transformers. There is a chance that the transformer oil will absorb moisture while the transformer is open. To prevent this, the oil is heated so that it is warmer than the ambient. This is done with a hot-water heater that warms the oil in a heat exchanger. Pumps are used to circulate both the oil and the water through the heat exchanger. This system, in addition to keeping the oil free of moisture, makes it more comfortable for the men who work on the transformer, especially in cold weather.

It has been suggested that a lead-alloy cable sheath should be used. The increased strength and other desirable properties of the lead alloy should make it possible to use a thinner sheath with corresponding savings of material, weight, size, and cost. Such cables have been installed to test various alloys. However, it is now found that in some cases an aging takes place that makes the cable sheath lose ductility. Cracks appear which admit moisture and cause the cable to fail.

One distribution company reports that it has been possible to improve its service by using radio to direct its cars and trucks. The men are directed from headquarters where to clear up hazards and can call back for materials, and report on repairs and sectionalizing. A 25-watt a-m transmitter at headquarters and 15-watt transmitters in the trucks have been found satisfactory to cover 140 square miles of territory.

Kentucky Utilities Company has installed a 35-kv gas-filled cable near an airport at Lexington, Ky. This is to lessen the hazards to the planes that use the airport.

COMMUNICATIONS

The Rural Electrification Administration and the American Telephone and Telegraph Company are working together in planning new lines to service new areas. It is important to make interference a minimum on telephone circuits. The concerns have decided it will be more economical to plan ahead on a system basis rather than to work independently and then locate and correct mistakes after they have been made.

The General Electric Company has recently developed a "super-air" loudspeaker. The model tested can be heard from a distance of four miles over the water or two and one-half to three miles over the land. The sound intensity has been measured at +110 db at 30 feet from the loudspeaker. A portable public address unit has been assembled weighing 200 pounds. It contains the loudspeaker, amplifier, microphone, and air compressor. The loudspeaker should be useful in noisy places such as fan rooms and crusher rooms.

LICENSING ENGINEERS

Illinois has now decided to license its engineers. Governor Dwight H. Green signed the new statute July 20, 1945. It requires that a professional engineer must have either eight years experience and knowledge equivalent to that required for graduation from an engineering college, or four years experience in addition to an engineering degree. It provides that all engineers now practicing shall obtain licenses within one year by proving they are of "good moral character and temperate habits."

INSTRUMENTS

A new 60-cycle frequency meter has been developed with a range of 59.5 to 60.5 cycles. The pointer radius is 12 inches, allowing a deflection of over five inches for 0.1 cycle. The instrument contains a frequency bridge. One slide-wire adjustment is required to give balance. The bridge is balanced by a driving motor supplied by an amplifier that receives its signal from the bridge. The instrument was calibrated against radio-station signals. A 10,000-cycle oscillator was synchronized with the radio signal. A calibrating signal of approximately 60 cycles was compared with the 10,000-cycle signal by means of Lissajous figures. The calibration was found to be constant to within 0.01 cycle over several months.

Electric calipers have been made for measuring pile diameters. The movement of one of the caliper arms causes the slider to move on a rheostat. By measuring the rheostat resistance the opening is determined. The device is made watertight, hence can be taken under the water by a diver who makes measurements that are read on a meter above water.

The electron microscope is coming into wider use; the latest institution to install one is the National Cancer Institute at Bethesda, Md. The microscope uses electrons instead of light rays and magnetic fields to do the work of lenses. It has been used to learn how the disease-fighting organisms in the blood, such as white corpuscles, attack disease-producing viruses. The study is being made to help control infantile paralysis, yellow fever, and the common cold. An additional use of electron microscopes is to determine the effectiveness of air cleaning equipment in removing pollen and smoke particles which may be too small to be seen by other means.

A network calculator has recently been installed by the Armour Research Foundation of the Illinois Institute of Technology. The circuit elements for the calculator were purchased from the Westinghouse Electric Corporation. The calculator can handle problems involving 12 generating stations, 40 loads, and 100 transmission lines and transformers. The calculator will make it possible to solve problems in a few days that would otherwise require weeks or even months to solve.

BUSINESS

The electrical output curve closely followed in 1945 the curve for 1944 until the end of active fighting in midsummer. The curve then dropped rapidly and is tending to approach the 1942 level. The maximum output for 1945 was in January when it was at an all-time high. During the third quarter of the year the output dropped about 12 per cent of the January value. The tendency at the end of the year is to match the 1942 curve both in height and formation.

The first important step in reconversion is to be sure that power will be available to run the machinery required in the manufacture of postwar products. In line with this thought, we find great demand for switchgear equipment and power connectors. The new trend is to install equipment capable of handling heavier loads than ever before.

RADIO

By G. L. Beers
Radio Corporation of America

GENERAL

The year 1945 must be viewed as one of the critical turning points in the radio industry. With the end of hostilities in both the European and Pacific theaters of war the radio industry was confronted with the problem of converting its greatly expanded manufacturing facilities from the production of vast quantities of military radio and electronic equipment to the manufacture of the radio instruments of peace. In addition to the conversion of manufacturing facilities the radio industry found itself faced with the inauguration, on a large scale, of two relatively new broadcasting services—frequency modulation and television. Yet to be determined was the extent to which many of the new radio devices and techniques developed during the war could be used in peacetime pursuits.

MILITARY RADIO EQUIPMENT

Shortly after the cessation of hostilities the shroud of secrecy was lifted from many of the military radio equipments which were so vital to our military operations. Taken as a group, the devices under the general classification of radar, an abbreviation for "radio detection and ranging," were the most numerous and undoubtedly the most important. An indication of the extent to which radar equipment was used by the armed services is given by the fact that, from the start of the war until July 1945, approximately $2,700,000,000 of radar equipment had been delivered to the Army and Navy. Of this quantity approximately $1,000,000,000 was airborne equipment, $500,000,000 was shipborne equipment, $800,000,000 was ground equipment, and $400,000,000 was miscellaneous radar.

Radar principles were first used to measure the distance to the ionosphere, which is the radio reflecting layer near the top of the earth's atmosphere. The method of measurement involved the sending skyward of radio frequency signals in the form of very short pulses, a small fraction of a second in length, and measuring the time it took the pulse to reach the ionosphere and be reflected back to earth. Since radio waves travel 186,000 miles a second, it was a simple matter to convert the time required for the pulse to travel to the ionosphere and back to earth into distance. The reliability of any such distance measurements is of course dependent upon the accuracy with which the time interval, in small fractions of a second, can be measured. During the war, techniques were developed for measuring time in fractions of a millionth of a second. Such time intervals correspond to an accuracy of only five or 10 yards in range.

Shortly before the beginning of the war it was found that, by radiating signals in a narrow beam through the use of directional antenna, the pulse ranging technique could be used both to locate and measure accurately the distance to objects such as airplanes and battleships. At the start of the war the British had installed ground radar equipment for the detection of aircraft, and it was this equipment which was instrumental in winning the Battle of Britain.

WAR USES FOR GROUND RADAR EQUIPMENT

During the war not only was improved ground radar equipment developed for detecting and ranging of enemy aircraft, but more elaborate equipment was devised in which the antenna system moved automatically so that it always pointed to the approaching plane and by remote control caused antiaircraft guns to follow the plane. Another important application of radar equipment was the ground control approach (GCA) or talk down system which was used at landing fields to land our planes when the pilots were unable to see the airstrip. By means of radar equipments covering the glide path for the landing strip, a ground crew was able to give verbal instructions to the pilots over the plane's radio communication system and to keep the pilot advised all the time whether he was above or below, to the right or the left, of the glide path. This system was very effective in bringing down planes, many of which would undoubtedly have cracked up in landing because of poor visibility. This type of radar equipment was assembled in a large mobile unit. One of its primary advantages was the fact that no special equipment was required in the plane.

SHIPBORNE RADAR EQUIPMENT

Naval use of radar equipment made it possible for our ships to go through whole engagements in which the enemy was detected, ranged on, and sunk without a single man having seen him visually. Not only does shipborne radar equipment make it possible to locate and destroy the enemy but it also enables the ships to keep in formation at high speed in unknown waters since they can "see" one another and the shore by radar.

AIRBORNE RADAR EQUIPMENT

Two of the important uses of airborne radar equipments were for the detection of surface vessels and for determining the position of enemy aircraft from night fighters. By means of the PPI or Plan Position Indicator type of equipment a map is drawn on the face of a cathode ray tube. With this equipment the radar operator gets a "picture" of the targets spread out below. A high percentage of the submarines destroyed in the latter stages of the war was detected by means of airborne radar. Radar made it possible for bombers in unfavorable flying weather to "see" landmarks such as shorelines, cities, mountains, lakes, and rivers. Not only was it possible for them to navigate unerringly to the target area, but if the weather prevented a visual bomb run they could line up on the target and bomb by radar.

Two general types of altimeters were also important items of airborne radar equipment. Both types radiated a signal from the plane to the ground, and the altitude was determined by measuring the time for the signal to travel from the plane to the ground and back to the plane again. One type had an altitude range from a few hundred feet to 50,000 feet. This type, which was very accurate, radiated signals in the form of very short pulses. The second type had a normal range from 0 to 400 feet, but a switching arrangement could be used to extend its range to 4,000 feet. The determination of altitude with this type of altimeter was made through the use of frequency modulated signals. Both altimeters gave the distance between the plane and the terrain beneath as distinguished from the elevation above sea level. Thus these instruments were valuable navigational aids since they could be used at night or in unfavorable weather to warn the pilot of obstructions when flying over unknown terrain.

Another important type of airborne radar was the tail warning equipment which warned fighter pilots of the approach of enemy aircraft from the rear.

MISCELLANEOUS RADAR EQUIPMENT

One of the most important and best kept secrets of the war was the VT proximity fuse. This fuse consisted of a miniature radio transmitter and receiver which operated within the shell after it was fired from a gun. When the projectile containing the fuse was fired radio waves were radiated by the fuse. These radio waves were reflected by the target and picked up by the receiver in the fuse. When the projectile came within a desired distance of the target the reflected signal from the target became sufficiently strong to cause the receiver to detonate the projectile. The VT fuse greatly increased the effectiveness of antiaircraft fire. In combination with radar detection and ranging equipment, it was used quite successfully against the V bombs directed at London. The VT fuse also provided an excellent anti-personnel weapon since through its use a projectile could be exploded at a desired height above ground showering a wide area with shell fragments.

Two navigational systems employing either radar principles or operating techniques closely allied to radar were used extensively during the war. The Loran (Long Range Navigation) System provides the navigator of a ship or an aircraft with a knowledge of his position by measuring the relative time of arrival of two or more radio signals sent synchronously from known points. At the end of 1945 the several installations of this system provided precise navigational coordinates covering approximately one-quarter of the earth's surface. It is expected that this system will play an important role in post-war transoceanic air navigation.

An aircraft employing the Shoran (Short Range Navigation) System determines its position by radiating a signal which is automatically picked up and repeated by two ground stations. The "fix" or position is obtained by measuring both the total elapsed time between the transmission of the signal and the reception of the repeated signals and the relative time difference between the repeated signals. This navigational system was used primarily for bombing under conditions of poor visibility. The accuracy obtained in bombing with Shoran has been reported to be equal to the accuracy of the best visual bombsights.

THE FEDERAL COMMUNICATIONS COMMISSION

Paul A. Porter, who took office as a member of the Federal Communications Commission on Dec. 22, 1944 under a recess appointment by President Roosevelt, was confirmed by the Senate as Chairman of the Commission on Jan. 18, 1945.

Governor Case's term as Commissioner expired on June 30, 1945. William H. Wills was nominated by President Truman on June 13, 1945 to fill the vacancy. He was confirmed by the Senate on July 12, 1945 and took office July 23, 1945.

F.C.C. FREQUENCY ALLOCATIONS

During 1945 the Federal Communications Commission's efforts were directed primarily toward the allocation of frequencies for frequency modulation and television and the establishment of rules and regulations for these two broadcasting services.

The initial F.C.C. hearing on the allocation of frequencies between 10 kc and 30 Mc began on Sept. 28, 1944. The Commission on Jan. 16, 1945 issued a proposed report for frequencies above 25 Mc. Oral argument on the Commission's proposed report began on Feb. 28, 1945. During this hearing, reference was made by the Commission's experts and others to classified material on propagation. Secret sessions were accordingly held on March 13 and 14, 1945 at which individuals with the proper military clearance could review this classified material.

The Commission on May 21, 1945 issued a final allocation report on frequencies above 25 Mc. This report proposed the following three alternative assignments for frequency modulation broadcasting: (1) 50-68 Mc, (2) 68-86 Mc, (3) 84-102 Mc. Propagation tests were suggested which were to be conducted by the Commission's engineers with the cooperation of industrial engineering organizations. These propagation tests were to provide information which would assist in choosing one of the three alternative allocations.

Early in June 1945 the Frequency Modulation Broadcasters Incorporated and the Television Broadcasters Association both petitioned the Commission to forego the propagation tests and take immediate action on the allocation of frequency modulation and television channels. Both organizations recommended alternative allocation proposal number one which retained frequency modulation broadcasting in substantially its pre-war position in the frequency spectrum. The Commission then set June 22, 1945 for further oral argument on the alternative proposals.

On June 27, 1945 the F.C.C. announced the final allocation for frequency modulation broadcasting and television. This allocation was essentially the same as alternative three in the Commission's report of May 21, 1945. Frequency modulation broadcasting was allocated 100 channels 200 kc in width between 88 and 108 megacycles. Television was allocated thirteen 6 Mc channels for a commercial television broadcasting service. Six of these channels were located between 44 and 88 megacycles and seven were between 174 and 216 megacycles. The 44 to 88 Mc band included, in addition to the six television channels, four megacycles between 50 and 54 Mc for amateur use and four megacycles between 72 and 76 Mc for non-government fixed and mobile services. Frequencies between 480 Mc and 920 Mc were allocated by the Commission for experimental broadcasting of both high resolution monochrome television and television in color.

A ten megacycle band between 460 and 470 Mc was allocated for Citizens radio. In this band the Commission will license individuals to use equipment of the walkie-talkie type or equipment installed in an automobile by which an individual can talk with his home or office. Citizens radio may be of great value to physicians, farmers, and other individuals who may have need to communicate frequently with their homes or offices.

THIRD INTER-AMERICAN RADIO CONFERENCE

The Third Inter-American Radio Conference was held in Rio de Janeiro in September 1945. This conference was marked by a spirit of cooperation among the delegates and by unanimity of opinion as to objectives and methods of procedure. During the conference the Inter-American Radio Convention of Havana 1937 was revised to include all forms of telecommunications. The Inter-American Radio Office was also expanded into an Inter-American Telecommunications Office under the supervision of the Pan American Union. Its seat will remain in Havana, Cuba.

A number of resolutions, recommendations, and material for study by future telecommunications conferences were adopted, the chief of which was the frequency allocation plan proposed by the United States delegation. In general, the other nations of the Western Hemisphere were favorably impressed with this allocation plan. The United States plan for a Central Frequency Registration Board was also generally approved by the conference.

A resolution was adopted recommending complete liberty of information in radio communications. Recommendation was made that a special world conference be called immediately following the next International Telecommunications Conference and at the same place as the International Conference, for the special purpose of resolving the problems relative to high frequency broadcasting and to eliminate the present chaotic state in the frequency bands assigned to this service. Another recommendation provided for the trial of frequency modulation broadcasting in those tropical zones where standard broadcasting had been found unsatisfactory, and high frequency broadcasting has therefore been used for local coverage.

There was general agreement regarding a proposal by Uruguay for an Inter-American Association of Broadcasters and a conference was scheduled for March 15, 1946 in Havana to arrange the details for such an association. Plans were also laid for an engineering conference of parties to the North American Regional Broadcast Agreement to consider the terms under which this agreement could be extended beyond its present expiration date of March 29, 1946. It was further agreed that the Fourth Inter-American Radio Conference would be held in Colombia.

INTERNATIONAL AND MARINE COMMUNICATIONS

The year 1945, from the standpoint of point-to-point communications, was marked chiefly by the establishment of points of communication in Europe and the Far East as a result of the successful prosecution of the war. In addition to the reopening of circuits interrupted during the war several new telegraph and telephone circuits were established.

At the beginning of 1945, marine communication, except for safety purposes, was limited to certain inland waterways. U. S. ships on the high seas were required to maintain radio silence. At the end of May, 1945, the radio silence restriction was removed for cargo ships in the Atlantic and in certain other waters considered as non-combat areas. In August, 1945, all ships in non-combat areas were permitted to send messages relating to ship's business. In September, 1945, the entire world was classified as a non-combat area. Marine traffic, however, continued to be restricted because of a lack of sufficient frequencies and because of the necessity of continuing a world wide air-sea rescue communications system. Coastal stations on the East and Gulf coasts were reopened in October, 1945, and reassigned a limited number of high frequencies for long distance communication.

RADIO RELAY SYSTEMS

The Western Union Company with the cooperation of the Radio Corporation of America demonstrated a radio relay system between New York and Philadelphia and announced plans which may ultimately lead to a replacement of their wire lines with radio beams. The Telephone Company is installing a radio relay system between New York and Boston. The Raytheon Co., General Electric Co. and International Business Machine Co. have also indicated their intentions of entering the radio relay field.

RADIO RECEIVERS

It is estimated that the total number of radio receivers in the United States on Jan. 1, 1945 was approximately 48,000,000 home and portable type instruments and 7,000,000 auto receivers. Surveys have shown that approximately 10 per cent of these instruments were inoperative and in need of repair. The number of receivers in use, which will be considered obsolete when new instruments appear on the market, will depend to a considerable extent on the public acceptance of new broadcasting services such as frequency modulation and television. It was quite evident, however, that at the end of 1945 the radio industry was faced with an exceptionally large potential demand for new radio receivers. The time required to satisfy this demand will probably depend on limiting items such as electrical components, tubes, and cabinets. Although some delay is attributed to the change in the frequency allocations for frequency modulation broadcasting it is expected that both frequency modulation and television receivers will appear on the market in the early part of 1946.

AMPLITUDE MODULATION (AM) BROADCASTING

In 1945 radio broadcasting was privileged to bring to the people of the nation the first news of three events of extraordinary significance—President Roosevelt's death and VE and VJ days. The dependence of the public on radio broadcasting for news of unexpected happenings was amply demonstrated by these events. The cessation of all hostilities in August shifted the background in many radio programs from war to peace.

The sales of several AM broadcasting stations were consummated during 1945. One of the outstanding transactions was the purchase by Aviation Corporation of Station WLW from Powell Crosley. Significant of the interest of newspapers in the broadcasting business was the purchase by the *Philadelphia Evening Bulletin* and *Philadelphia Inquirer* of Stations WPEN and WFIL, respectively, and the acquisition of WQXR by *The New York Times*.

The high level of general business

activity during 1945 was reflected in the extensive use of broadcasting as an advertising medium.

FREQUENCY MODULATION (FM) BROADCASTING

Frequency modulation broadcasting during 1945 was characterized by curtailed program schedules imposed by manpower and replacement parts restrictions. In the latter months of the year several stations discontinued broadcasting in order to proceed with the installation of equipment for their new channel assignments in the 88 to 108 Mc band. It is expected that a number of stations will begin operation in the new frequency band during the first half of 1946. The justification for shifting FM broadcasting from the region of 50 Mc to the 88 to 108 Mc band was the subject of a heated controversy during the 1945 hearings before the Federal Communications Commission.

Over 600 applications for licenses to operate frequency modulation broadcasting stations were on file with the Commission at the end of 1945. Approximately 60 per cent of the AM broadcasting stations have indicated their intention of entering the FM broadcasting field by applying for FM licenses. Newspapers constitute a relatively large percentage of the FM applicants who do not own AM stations.

TELEVISION BROADCASTING

The year 1945 brought with it increased activity on the part of several television broadcasting stations. Live talent pickups which had been discontinued during the war were resumed and the number of program hours increased. One of the notable television events of the year was the broadcasting of the Army-Navy football game direct from the Municipal Stadium in Philadelphia. This game was broadcast by television stations in Philadelphia, New York, and the Schenectady-Albany area. The program was relayed to New York over the American Telephone and Telegraph Company's coaxial cable and from New York to Schenectady by radio relay.

At the end of 1945 more than 130 applications for commercial television broadcasting licenses were on file with the Federal Communications Commission. It is estimated that the 13 channels allocated to commercial television broadcasting will permit more than 400 television stations throughout the United States with a maximum of seven in any metropolitan area. Interference problems in the congested eastern seaboard area will further limit the number of stations which can be allocated to cities such as Philadelphia, Baltimore, and Washington.

Two of the major problems confronting television broadcasters at the beginning of 1945 were: 1. Television network facilities which would supply a large number of television stations at distant points with programs from any studio or pickup location, and 2. Television pickup tubes with sufficient sensitivity to make it possible to televise events under very unfavorable light conditions.

Definite progress was made during 1945 toward a realization of both these objectives. The American Telephone and Telegraph Company completed its coaxial cable from New York to Washington through Philadelphia as an intermediate point. The telephone company announced plans to complete by 1950 a coast-to-coast network for the transmission of television programs. During the early part of the year the Philco Corporation gave a demonstration of a television radio relay system installed between Washington and Philadelphia. Other organizations announced plans for actively investigating radio relay systems as a means for networking television stations.

Progress on the pickup tube problem was indicated by the RCA Laboratories' announcement of the development of the Image Orthicon having a light sensitivity at least 100 times greater than previous pickup tubes.

The Westinghouse Co. in cooperation with the Glenn L. Martin Co., announced plans to investigate the possibility of broadcasting frequency modulation and television programs from transmitters in planes flying at altitudes of 30,000 feet.

Demonstrations were given during the year of projection type home television receivers employing improved optical systems having high efficiency and producing pictures approximately 18 by 24 inches.

TECHNICAL PROGRESS IN SOUND EQUIPMENT

By W. J. Morlock
RCA-Victor Division, Radio Corporation of America

GENERAL

Before the Second World War, sound equipment developed normally under pressure of ordinary consumer demand. With the impact of war, however, manufacturers concentrated their efforts on equipment for military use. By the early part of 1945, they were turning out, in stupendous quantity and variety, equipments that had higher efficiency and greater reliability, when used under the most trying extremes of conditions, aboard ship and in the field, than anything previously produced.

Reports from installations at sea and on land, during 1944, indicated that new materials, innovations in their treatment, and new manufacturing methods resulted in equipment that was vastly improved for the most exigent military purposes. These improvements brought increased demand for sound equipment in a far wider variety of applications.

With the end of the war, military demands became less pressing, and manufacturers turned their attention to the commercial field; they took with them, ready for application, all that had been learned through production for war purposes. Every indication points to the fact that this renewed activity will provide, in addition to better operative equipment, newer types of installations that may be utilized in a widely varied field.

SOUND AMPLIFYING SYSTEMS

The extensive use of sound amplifying systems in military operations, and the efficiency resulting through their use, has increased the commercial demand for the same sort of systems. Among these, demands from factories and offices loom large on the business horizon. Many of these organizations have already installed sound broadcasting systems as a means of improving employee efficiency. During wartime shortages of equipment, these systems were assembled from the best then available; but the demand now is for improved and reliable components designed for specific applications.

The equipment manufacturers have studied these requirements, and as a result, will be producing especially designed components, such as microphones, amplifiers, control consoles and loudspeakers, all of which will have the reliability and ruggedness required by industrial plants. As these plants are reconverted, the trend has been to acquire "Engineered Sound Systems," especially designed to provide facilities for general or selected area broadcasting of musical programs, time signals, emergency alarms, and the like. Relations between personnel and management are improved by an intelligently operated plant-wide broadcasting system. Consequently, emphasis is placed not only on the necessary equipment, but also upon the responsibilities in the operation of the system.

One of the most effective mediums in promoting employee morale and cooperation is the broadcasting of planned programs, usually under the auspices of the personnel department. Thus, the controls and the entire operation have been simplified, so that non-technical members of the staff can handle the system. Some manufacturers have incorporated various automatic features in their systems, such as automatic volume control operation and interlocking switching circuits, in order to meet the new conditions.

USE OF SOUND SYSTEMS IN EDUCATION

There has been an increasing utilization of sound systems in schools and colleges, and as a consequence, the United States Department of Education is establishing specifications to be used for guidance in setting up these systems. This activity has not yet progressed to the point at which the schools have a definite set of specifications, but equipment is rapidly being standardized.

The Federal Communications Commission has allotted F-M wave lengths to the schools, and the plans are to have a central broadcasting station that devotes its time to transmitting courses of instruction to schools. Lectures and information will be picked up and selected by individual schools and broadcast over their respective sound systems. The plan of operations is still incomplete, but the progress being made is encouraging. Meanwhile, the schools are procuring equipment so that they may take advantage of the central service when it becomes available. The educational field is alert to the advantages in the use of special equipment, already proved efficient by the military forces, for instruction. Various manufacturers are already preparing to produce equipment, such as recorders for voice and music instruction, transcription records, and film reproducing systems, especially designed for educational purposes.

SOUND SYSTEMS FOR HOSPITALS

Among other necessities brought about by the war is a great expansion of hospitalization facilities. This has introduced greater requirements for sound systems adapted for hospital use. The Government, during the war, procured broadcast equipment for use on hospital ships, and this demand is being carried over to the land hospitals. Equipment of this type provides not only entertainment and relaxation for the patients, but also is of help during the shortage of trained personnel, if the proper features are built into the system. The amplifying equipment, in general, is similar to that used in industrial plants, but the control facilities and the loudspeaker features are designed specifically for hospitals.

Some manufacturers are producing a special type of earphones for hospital patients that are free from the principal inconveniences of the older types. The new models provide for the sound to be conducted through the bone structure of the skull, thereby relieving direct pressure of the earphones against the ears. Other manufacturers are providing acoustically compensated loudspeakers of the "under-the-pillow" type. These items, plus a control system which enables the patient to talk directly from his bed to the nursing supervisor, save time and many extra steps for the nurses. In addition, the "talk-back" system is extremely useful, both physically and psychologically, during a patient's convalescence.

REINFORCING SYSTEMS FOR LECTURE ROOMS AND OTHERS

The need is increasing for high quality sound reinforcing systems for auditoriums, lecture rooms, and banquet halls. Technical advances in small, two-way speaker systems make better quality equipment available for this use. The resultant effect of the wider range equipment is to eliminate the artificial tone quality which was apparent in many of the pre-war units. A basic requirement for obtaining greater naturalness in sound reinforcing systems, which is becoming better recognized, is that such systems should "reinforce" the sound to its original level only, rather than "amplify" the sound to unnaturally high levels. This is particularly so when prominent lecturers or organizations are to be attracted to a locality. In larger auditoriums and theatres that feature stage shows, the trend toward use of this improved equipment is developed to the point where control consoles are installed and operated in conjunction with a multiplicity of concealed microphones. This type of system produces naturalness of tone, and assures adequate sound coverage. One of these modern systems is installed in the Chicago Civic Opera House.

THEATRE PROJECTION EQUIPMENT

Although hostilities ceased in August, 1945, there has not yet been time enough for commercial equipment to profit by the full effect of wartime development. However, it is confidently expected that experience in providing, for the armed forces, equipment that is rugged and reliable under all conditions, will lead to outstanding improvements in post-war design for general use.

In the production of sound tracks, laboratory work has given the industry acceptable dye type instead of the usual silver sound tracks used in color films; results have been excellent. In addition, phototubes, usable with either dye or silver sound tracks, have been developed which may find further use in theatre sound equipment.

Another advance owing to the development of improved materials is the production of superior loudspeakers that feature higher sensitivity and wider frequency ranges. In the general type of sound equipment for theatre use, there has been little change; however, some new designing permits simplification of installation and servicing of equipment. Various manufacturers are already quite active in developing large picture television systems for theatres. In this category, two basic ideas are being considered. The first is the use of high-voltage cathode-ray tubes with a special projection lens of high light efficiency. The second is the exposing of film by a small cathode-ray tube, coupled with a high-speed developing process. The first system has the advantage of instantaneous projection and low operating cost. The second system has the advantage of more screen illumination and controlled program delay. No definite conclusions can yet be drawn regarding the relative merits of the two systems.

16 MM SOUND PROJECTORS

The experience with 16 MM sound projectors by the Army and Navy during the war has provided an incentive to the commercial use of the 16 MM equipment, and has been instrumental in making 16 MM films, for entertainment and training, available to the general public.

Many manufacturers are planning to sell equipment especially designed for the home, schools, and small theatres. Although built according to the same basic principles of earlier models, the newer equipment embodies simplified design features and components developed during the war. The trend toward simplicity will undoubtedly reduce the size, weight, and cost as compared with former equipment.

At present, the demand for installation of 16 MM equipment in the educational field is the most pronounced, as the value of visual teaching has been widely publicized. In general, this equipment is of the semi-professional type and of rugged construction. Similar units for home use are being developed, which, since the basic requirements as to sound and light are less, will supply only what is adequate. These developments, if successful, will provide an instrument for the home which is specifically designed for such use in regard to performance and cost. Plans are under way by certain large commercial organizations to make feature films available for home instruments on a moderate rental basis. If these plans materialize, the projection of sound motion pictures in the home living room may become as common as the phonograph.

Another item in the entertainment field, which was started before the war, was the coin-operated 16 MM sound projectors. New equipments will use the same principles, but will certainly be more sturdy and reliable.

The increased demand for the standard 16 MM sound projectors has brought an increased demand for 16 MM recording equipment, which manufacturers are already supplying. As the result of wartime experience, recording equipment also will be reduced in size and complexity.

BROADCAST SPEECH INPUT EQUIPMENT

The end of the war saw an increased activity in supplying the peacetime demands of broadcasters for new equipment with which to enter the television and F-M broadcasting markets. The valuable lessons learned during the war are being turned to use in peacetime. The advantages of standardization have been apparent for many years, but the newest step involves the interchange of complete equipments and components. Notable advances have been made in the utilization of plug-in components of all types, including plug-in amplifiers and capacitors; thus simplifying the work of the broadcaster. The high performance standards of the F-M broadcaster are reflected in now components now in production in that they have appreciably greater frequency range, lower distortion, and quieter operation. Great strides also have been made in loudspeaker and microphone developments. Microphone frequency range has been increased to 15,000 cycles, and the new speakers faithfully reproduce this wider frequency range. For the first time, the broadcaster now has a new, highly efficient tool—a wide-band, high-fidelity broadcast system from microphone to loudspeaker.

NAVAL ARCHITECTURE AND MARINE ENGINEERING

By James L. Bates
Director, Technical Division, U. S. Maritime Commission

GENERAL

The year 1945 saw the completion of the war shipbuilding programs of merchant ships, the greatest shipbuilding accomplishment of all time. As VE and VJ days were proclaimed, the nation's merchant shipyards were occupied in the main in the turning out ships for use by the military and for transporting oil and gasoline to the various battle zones.

Late in 1944 the Liberty ship program was gradually curtailed to permit the construction of the faster Victory ships. This program was completed before July except for a few conversions to colliers and for carriage of unboxed planes. The Victory ship programs of both cargo carriers and combat-loaded cargo and transport service were also completed.

The merchant shipbuilding program for 1946 will be limited to the building and conversion of ships for the postwar era. The emphasis probably will be on passenger-carrying ships and long range type cargo ships arranged and equipped to suit particular trade routes and operators.

During the first half of 1945 the major shipbuilding effort was in the construction of merchant ships adapted to suit immediate military needs. Such vessels included the combat-loaded cargo and transport types for Navy use, the small cargo carrier for use between far-flung bases in the Pacific, and tankers.

PRODUCTION

The merchant shipyards were kept busy the first six months of the year in completing the various shipbuilding programs. As the various yards completed their programs, some turned their attention to urgent repair work of both naval and merchant craft. The cessation of hostilities caused a cut-back in some of the programs, which resulted in a number of shipyards terminating their activities.

The 1945 record of construction shows that there were delivered to Dec. 1, 1945, 1,064 vessels of 10,373,016 tons deadweight. These totals include 144 Liberty type ships, 310 Victory cargo type, 117 "C" type cargo, 162 tankers, 86 military type, and 255 miscellaneous vessels.

The grand total of construction since Jan. 1, 1942 to Dec. 1, 1945, is 54,002,123 deadweight tons. The number of ships built in the same period is 5,573, of which 2,710 were Liberty type ships, 531 Victory type vessels, and 597 tankers.

Construction has started on the adaptation of the long range type vessels to various trade route requirements, and also on a number of refrigerated type vessels of new design and other vessels. These vessels include three C3 combination cargo and passenger vessels for the Mississippi Shipping Co. and nine C2 combination type for the Grace Line; two vessels of the P2 type for passenger cargo service in the trans-Pacific trade and 17 C3 type and nine C2 type cargo vessels to suit various operators. Three Victory type ships are also being converted for passenger service in the Caribbean for the Alcoa Steamship Co..

One ore carrier of new design for the carriage of iron ore from Cruz Grande, Chile to Sparrows Point, Maryland, was delivered and three more are under construction. Of the nine twin screw all reefer ships contracted to be built for the United Fruit Co., one was delivered, and another was scheduled for delivery before the end of the year.

Two cable laying and repair vessels, MC. design S3-S2-BP1, were completed. These vessels are unique in that they are the first cable ships to be designed in this country and consequently have many improvements introduced in comparison with previous vessels converted from existing tonnage. The cable machinery in particular and the means for control of the vessel received special attention so as to provide the greatest flexibility of operation.

CONSTRUCTION CANCELLATIONS

The end of hostilities eliminated the need for many of the vessels then under construction intended for use in military operations. A thorough review was made of the construction programs, and many cancellations of contracts resulted. These cut-backs affected one yard and four Liberty ships; three yards and 42 Victory ships; two yards—13 military type; six yards—36 tankers; and six yards—47 miscellaneous types.

A study of the probabilities of returning certain vessels to their former peacetime passenger service, both from the standpoint of cost and time, showed that the North Atlantic passenger service could be maintained by these vessels through the readjustment years immediately ahead. Work on the conversion of the three P2 type vessels for this service was, therefore, discontinued.

Throughout the war, some 91 yards engaged in the building of the vessels included in the Maritime Commission programs. On Dec. 1, 1945, 16 yards were still building merchant ships, five of which yards had been erected to take care of the emergency construction of merchant ships and special craft for military use.

CARGO HANDLING

During the year steps were taken to put into practice some of the results of the many studies made on this subject.

Overhead gantry cranes traveling athwartships were fitted over the forward hatches of the *Sea Hawk,* a C3 cargo vessel. The outboard tracks are supported by hinged triangular cantilever trusses hinged at deck edge to stow inboard or parallel to the ship's side, which permit the traveling cranes to pick up cargo from 20 feet over the ship's side. The travelers over double ganged hatches carry two winches of five tons capacity and two of 20 tons capacity each. Change over from light to heavy lift can be accomplished instantaneously by the shift of a lever. Marriage of the two heavy duty winches through an evener makes it possible to handle single lifts up to 40 tons.

The use of this rig has brought out certain objections such as insufficient drift limiting its use to certain cargoes and certain ports. Where piers have narrow aprons the vessel needs breast-ing out from the pier. This rig was described fully in a paper presented at the annual meeting of the Society of Naval Architects and Marine Engineers held in New York Nov. 15, 1945 by Arthur C. Rohn of the U. S. Maritime Commission.

Improvement in overhead gear operating over twin hatches was made the subject of special investigation by the U. S. Maritime Commission.

Steps toward introducing uniform packaging and use of containers in special designed ships were taken by Great Lake interests for the handling of freight on those water routes.

PROPELLING MACHINERY

The year 1945 witnessed notable commercial developments in Marine Engineering. Because of the importance of good economy and the less critical weight and space limitations, the commercial development differs widely from the naval development. The commercial unit runs at its designed power most of the time, and secures lower fuel rates and maintenance costs at the expense of space and weight.

During the year the largest trunk piston Diesel engine built in this country, a Nordberg engine developing 6000 SHP at 160 R.P.M., was installed on a Victory ship. The Ore Steamship Co. put into service the first of four of the largest ocean-going bulk cargo ships in the world. These ships are propelled by 11,000 SHP steam turbine plant utilizing steam at 1400 psi and 740°F. which is reheated in two stages of steam reheats to 565°F. This ship attained a fuel rate of .505 pounds per shaft horsepower hour on trials.

In marine design the engineer has to balance the advantages in weight and cost of a high rotative speed in the prime mover against the advantage in efficiency of a low rotative speed at the propeller. This problem was successfully solved in the case of steam turbines by the use of mechanical reduction gearing or electric drive.

In the case of Diesel engines the speed reduction was accomplished by the use of electric drive using generators and motors or by the use of reduction gears provided that a flexible coupling is interposed between the engine and the gear to reduce the torque variations set up by the engine. On a class of small Diesel tankers it was found that the engines could be directly coupled to the reduction gear provided that the mass and stiffness of the component parts of the drive were so selected that there would be no serious torque fluctuations in the gear. Two such installations, using 1400 B.H.P. Enterprise engines turning at 300 R.P.M. and 1400 B.H.P. Nordberg engines turning at 272 R.P.M. for turning a propeller at 116 R.P.M., prove to be very practical in eliminating the space, cost, and losses involved in the use of a special flexible coupling.

On one of the C1-M-AV1 class of cargo ships there was installed a unit which by combining electric motor and generator in one provided higher efficiency with reduced space requirements as compared with a Diesel electric drive. This unit which transmits 2160 horsepower, reducing the revolution from 240 to 120, is the invention of Thomas D. Bowes, a naval architect, and was built by the Elliott Co.

Another vessel of the C1-M-AV1 class was equipped with a controllable pitch propeller built by S. Morgan Smith. The controllable pitch propeller gives excellent maneuvering characteristics in that any ship speed ahead or astern within the power range of the engines can be obtained without changing the engine R.P.M., with an efficiency nearly as good as that of a fixed bladed propeller and at a nominal cost. The installation is intended as a pilot installation for a gas turbine powered ship since it is not practical to reverse the gas turbine to run it at low rotative speeds.

The Maritime Commission ordered a 3,000 SHP gas turbine power plant from the Elliott Co. for an experimental installation in a coastwise collier (EC2-S-AW1). This plant is expected to develop a fuel rate of .450 pounds per shaft-horsepower hour and gives great promise in improved fuel economy with reduced weight, cost, and space within the range of power. The installation runs with much lower gas temperatures than the aircraft gas turbines, and is expected to give reliable service for the life of the ship. Stable operation over a wide power range required for a ship is obtained through the use of positive displacement Lysholm compressors.

WELDING RESEARCH

With the ending of hostilities, many of the research projects pertaining to welding which have been carried on under the auspices of the National Research Council, were either terminated or would be terminated by the end of the year. Steps were initiated by the government agencies interested in ship welding to create a governing body through which research problems could be handled with dispatch and without duplication of effort.

The Welding Research Council of the American Welding Society is continuing its research program into welding problems, covering all types of materials and welding methods. These programs are mainly concerned with the immediate problems of making weldments having suitable strength, ductility, and freedom from slag, porosity, and cracks.

The Maritime Commission made hog sag tests on the T2 type tankers to ascertain the actual stress distribution throughout the main strength members. Analysis of these tests is being used as a basis for future design detail and for corrective measures in the case of local troubles on vessels in service. Strain gage readings have also been taken on a T2 tanker while on the ways preliminary to launching. These readings will be repeated after launching when the vessel is waterborne. It is expected that much valuable information will be obtained in respect to the stresses present in a welded hull owing to the erection cycle, and to its position on the ways.

ALUMINUM ALLOY SUPERSTRUCTURES

For the past several years the problem of static stability in the design of passenger vessels has become increasingly difficult because of the rise in center of gravity of the light ship. This rise in C.G. was occasioned principally by the constant decrease in machinery weight and by the increase in outfit and equipment weights in the superstructure.

As the percentage length of a house or superstructure becomes greater it tends to work more effectively as a part of the main hull girder, *i.e.*, the upper decks carry more and more of the principal longitudinal stresses. As these stresses increase, the weight of the structure required to resist these stresses also increases. In a number of older vessels the percentage length of the house which acts with the hull has been reduced by the fitting of expansion joints. This method has not proven satisfactory owing to the indeterminate stress concentration which occurs where these expansion joints land on the main hull, and to the noises made by the expansion joints which are objectionable to the passengers.

From the above the indicated theoretically ideal material for use in the superstructure would have zero weight and zero elasticity, *i.e.*, it would develop no stress upon being strained or elongated and would, therefore, occasion no stress concentration at the house ends.

Aluminum alloys which weigh one-third as much as steel and which have a modulus of elasticity of one-third that of steel, was considered by the Commission many years ago to have the properties tending toward the theoretically ideal material for superstructure construction. In collaboration with the Aluminum Company of America, a number of tests and studies have been made, all of which have borne out the practicability of the use of this material. It should be pointed out, however, that aluminum alloys have some objectionable properties which have called for the solution of problems other than those of weight and strength. Among these objectionable properties are its high rate of corrosion when in direct contact with steel, which has been largely overcome, the loss of strength at relatively low temperatures from the fire-proof construction requirements standpoint, a greater deflection under load than steel, and the failure so far to develop satisfactory strength welds.

The U. S. Navy Department has successfully used aluminum alloy as a weight saving material in the short superstructures on some destroyers and cruisers. As a result of these applications, the recent development of new high strength alloys and the studies referred to above, the Commission designed and is now building two passenger vessels for the Pacific service which incorporate aluminum construction for the two top houses and stacks. The practicability of fabricating the particular high strength aluminum alloy being used was proven by its previous application to the stacks on a large transport built by the Federal Shipbuilding and Dry Dock Co.

Plans are now being completed to make full scale strength tests on the passenger vessels as soon as they are completed. At the present time there is every reason to believe that the results of these tests will substantiate the findings of the small scale tests and that future designs of passenger vessels may well incorporate 100 per cent aluminum alloy deck houses and superstructures.

CONSTRUCTION TRENDS

The construction programs formulated thus far for the year 1946 indicate that they will be principally concerned with vessels designed for the dry cargo and passenger trade on specific trade routes. Special emphasis is upon economy in respect to both first cost and cost of operation.

With the conclusion of the war and the return of the troops to the United States, a large volume of shipping will be released for commercial operation. The reconversion of these ships for specialized commercial operation is receiving considerable attention. As noted earlier, study and experimentation are under way to improve cargo handling and so permit more rapid turn arounds and a reduction in the cost of this phase of operation. The carriage of special cargoes such as vegetable oils and frozen foods is demanding ships with equipments designed for the service. Several excellent ship hulls suitable for passenger service in the less speedy trades will shortly be released from service as transports. These ships will be reconverted, as the demand warrants, to modern ships equipped with fluorescent lighting and a streamlined profile.

At the same time passenger ships for fast and comfortable inter-continental service are being developed. These will incorporate the latest development in hull and machinery design including the use of aluminum alloy superstructures. The emphasis on these as on the entire post-war program is to construct ships which by their simple and efficient design will give good returns upon their investment in competitive routes. The fireproofing, stability, subdivision, and other requirements for safety will continue to be most stringent. The machinery plants for these ships will utilize pressures and temperatures, as determined by the economics of the cycle used, appreciably higher than those in common commercial use at present in the marine field. The auxiliaries will be primarily electric driven. On these ships the use of alternating current becomes feasible.

The underwater body of these vessels will be designed to secure the optimum ship speed for the power input. The design of the appendages, propellers, and ship structure will be carefully developed in order to insure a ship free from objectionable vibration. Studies are also being made to develop a smoke stack which, while giving a good appearance, will be high enough to prevent smoke and soot from becoming a nuisance.

In accordance with the late President Roosevelt's directive to prepare plans for passenger vessels of bold and daring design, the Maritime Commission is giving the transportation of passengers on five important trade routes very careful attention. On the Mediterranean route, three new vessels of relatively large size and 22 knots speed seem to be in prospect. The Matson interests are considering far reaching rehabilitation of the Mariposa class vessels for the run to Australia and New Zealand.

The Maritime Commission is presently engaged in preparing contract plans and specifications for high speed combination passenger and cargo vessels on the run to the east coast of South America. There are also under consideration very high speed passenger vessels having negligible cargo capacity for the trans-Pacific service.

For the North Atlantic passenger service from New York to the United Kingdom and western Europe, serious study is being given to the rehabilitation of pre-war tonnage to serve as stop-gaps for the immediate future. What decision will be made as to the permanent tonnage for this service is not as yet known. Some representatives of the Commission favor ships which will cater to clientele developed by the *Manhattan* and *Washington* prior to the Second World War.

In view of the type of competition expected to be offered by the airplane, the shipping industry is closely following the development of trans-oceanic airplane transportation in order that the two may offer services which will complement each other rather than appeal to the same class of travel.

Now that the requirements of the war are past, attention is being paid to the development of radar principles for commercial use in navigation. The first of these electronic navigators are being installed on commercial ships.

The American people may be certain that the new ships, both cargo and passenger, will offer the type of service in efficiency, cost, safety and style commensurate with the leadership which the United States now has in the marine field.

GEOPHYSICAL SCIENCES

EARTHQUAKES AND VOLCANOES

By Frank Neumann
Chief, Section of Seismology, U. S. Coast and Geodetic Survey

GENERAL

Seismic activity throughout the world in 1945 generally followed a normal pattern; if there was a trend, it was toward a subnormal year. There was no shock of outstanding importance except an unusually strong sea quake off Japan. To students of seismology the end of the war was the signal for renewing international cooperation, since the exchange of papers and instrumental data on a broad scale is a most important phase of earthquake research. The exchange of such data is a prime requisite for the authentic mapping of world earthquakes. In volcanology, scientific activity was concentrated primarily on the more readily accessible active volcanic areas.

EARTHQUAKES IN FOREIGN AREAS

In December 1944, two shocks of importance occurred. On the 7th a sea quake in the Pacific 100 miles off the coast of Japan generated a tidal wave which inundated houses along the coast, but damage was generally light. Instrumental records indicated that the shock was stronger than that which destroyed Tokyo and Yokohama in 1923.

In northern England, a shock on Dec. 30 was felt over a radius of 100 miles but there was no damage. On Jan. 11, 1945, the island of Jamaica was shaken and on Feb. 10, Japan experienced a widespread but nondestructive shock centering in Aomori prefecture. Adana, in southern central Turkey, reported the most destructive earthquake of the year on March 20, one despatch indicating 300 killed, another despatch 14 killed. Although 500 houses were reported destroyed, distant seismological stations did not record a major shock.

A strong shock off the Pacific coast of Colombia actuated the strong-motion seismograph at Balboa Heights, Canal Zone. Santa Fe, Panama, was badly shaken on June 3 when slight damage was also reported from David and Puerto Armuelles. On July 9, Colombia felt a strong submarine earthquake originating beneath the Pacific, and on Sept. 13, a disturbance originating in the mountains northeast of Santiago shook a large part of central Chile and actuated the strong-motion seismograph in Santiago. On Nov. 28, 4,000 persons lost their lives at Karachi, India, when tidal waves rolled in from a sea quake originating beneath the northern part of the Arabian Sea.

EARTHQUAKES IN THE UNITED STATES

The strongest earthquake of the year, on April 29, centered about 40 miles southeast of Seattle, Wash. in the Mount Snoqualmie area. It was felt throughout most of the state and in small portions of Oregon and Idaho. At North Bend, chimneys fell and glass was broken. Moderate shocks occurred in the Hollister, California area on Jan. 7 and May 17. On Aug.

15, a widespread shock disturbed the Imperial Valley area and a large part of southern California. All three California shocks were recorded on strong-motion seismographs. In South Carolina, a moderate shock centering about 30 miles northwest of Columbia on July 26 was felt over a large part of the state. A local shock in Helena, Mont. on June 1 was one of the strongest in several years and operated the strong-motion accelerograph. Several counties near St. Louis, Mo. were shaken by a light earthquake on March 27. The ground and air waves set up by the atomic bomb experiment in New Mexico on July 16 were recorded on many seismographs in the western part of the country, the ground effect being similar to that of a moderately strong local earthquake.

SEISMOLOGICAL STATIONS AND INSTRUMENTS

The status of many stations of international importance is still unknown, but in the western hemisphere there has been little change. In South America, Chile leads in effective expansion of an instrumental program.

In the United States, 42 seismological stations are in operation. Lincoln, Neb., returned to active operation and Burlington, Vt., planned to operate by the end of the year with improved equipment. More sensitive equipment was installed at State College, Penn., and new equipment is under construction for the station at New Orleans. At a private experimental station at New Kensington, Penn., progress was made in the construction of a new design of electronic visible recording seismograph.

In the field of special purpose seismographs, the Harvard Seismographic Station completed the development of a 3-component instrument for measuring strong local disturbances caused by blasting, traffic, etc. At the University of California, a recently developed high-sensitivity vibration meter of simple design was tested for use as an instrument for recording earthquakes. Electronic converters were used to supply alternating current to seismograph recording apparatus in isolated regions where only storage battery power is available.

SEISMOLOGICAL INVESTIGATIONS

Field investigations directed toward the use of microseismic records in tracking cyclonic storms in tropical regions have proved successful. Microseisms, which are of meteorological origin, are the small unfelt vibrations of the earth's surface which are being continually recorded on seismographs. A practical method of measuring their direction of propagation was demonstrated at St. Louis University five years ago and was subsequently used by the Navy in hurricane investigations.

The classification of the world's most important earthquakes, according to a recently developed magnitude scale, was advanced considerably at the Pasadena Seismological Laboratory. Instrumental records and reports as far back as 1904 are being reinterpreted and 70 great earthquakes have thus far been identified. At the California Institute of Technology, investigations were continued on the relation between local earthquakes and fault structures.

Local earthquakes in the Boulder Dam area, caused by the great water load, were investigated and found to be associated to a large extent with certain local faults. There was evidence of a slight tilting of a large crustal block. The shocks were accurately located over a period of years from data obtained at seismological stations established by the Bureau of Reclamation in the Lake Mead area.

Special investigations in seismic areas continued, notably the instrumental program of the U. S. Coast and Geodetic Survey for recording destructive ground motions in the Pacific Coast states, an earthquake information program by the same organization, and the local chains of seismological stations in the San Francisco, Los Angeles, and St. Louis areas. The Canadian Government operates a similar chain of stations to investigate seismic activity in the St. Lawrence River area.

A representative of the Coast and Geodetic Survey visited many countries in South America under a seismological project sponsored by the State Department and installed strong-motion accelerographs at Quito, Ecuador and Bogota, Colombia. An excellent strong-motion record of the earthquake of Sept. 13 was obtained at Santiago, Chile where a similar type of instrument was installed early in 1944.

SPECIAL VIBRATION PROBLEMS

Vibrations caused by earthquakes and those owing to other causes have so many points in common that any broad review of seismological activities must include the listing of some border-line problems. Thus, quarry and other blasting, rockbursts, certain military operations, and even the weather are all sources of ground disturbance; wind, traffic, and machinery may cause buildings to vibrate. In the case of blasting, the seismologist gains information which aids him in locating nearby earthquakes, and the engineer obtains information on the magnitude and destructiveness of the ground motion. In 1945, valuable data of this type were obtained in Idaho where surplus stores of high explosives were fired at an ammunition depot. Various Federal and private agencies took advantage of this opportunity to test new types of instrumental equipment and measure the magnitude of the ground and air disturbances.

In engineering-seismology, continued attention was given the theoretical aspects of calculating building vibrations and building stresses resulting from known earthquake motions. As a result, more emphasis is being given the great influence which the type of foundation exerts on the motion of a structure during an earthquake.

In the commercial field, a marked impetus was noted in the development of vibration-measuring equipment, especially in the application of electronic principles. Some of this equipment, developed at considerable cost during the war, may find eventual application in the solution of seismometry problems although in most cases the designs contemplate higher frequencies than are found in earthquake motions.

RELATED MEASUREMENTS

Changes on the earth's surface which may be related to earthquakes include subsidence and elevation, also tilting, of large areas, ground water changes, slow creeping over large areas, and the appearance of scarps without evidence of earthquake activity. Tide gages in this country and others installed by the Coast and Geodetic Survey in South and Central America continue to give basic data which, among other things, will eventually indicate whether the coastal areas are changing elevation. In the Long Beach, California area a subsidence problem is under investigation and another tilt-meter of the Coast and Geodetic Survey type is being installed to supplement one which has been in operation several years. Three similar instruments were kept in operation on the campus of the University of California at Berkeley. Observations by the U. S. Geological Survey on changes of water levels in deep wells were continued. They frequently indicate the passage of earthquake waves emanating from distant points.

SEISMOLOGICAL ORGANIZATIONS AND PUBLICATIONS

All seismological organizations of the country continued to function and issue their usual publications and bulletins. The Seismological Society of America, including its affiliate the Eastern Section, and the American Geophysical Union with its Section of Seismology, constitute the two principle organizations devoted to the discussion of seismological and related problems, and the presentation and publication of papers. The principal publications are the *Bulletin* of the Seismological Society of America, *Earthquake Notes* (of the Eastern Section), and the *Transactions* of the American Geophysical Union. The Jesuit Seismological Association, primarily an organization of seismological stations, continued to issue instrumental bulletins.

Another group of stations is sponsored by the Coast and Geodetic Survey which also integrates the results obtained by other groups and independent stations in so far as this is needed to publish adequate earthquake summaries. In New England, New York State, and eastern Canada, the Northeastern Seismological Association issues bulletins covering seismic activity in that area. When occasion demands, field surveys are made by most of these organizations. Through a cooperative program involving Science Service, the Jesuit Seismological Association, the Coast and Geodetic Survey, and many individual stations in the United States and abroad, nearly 50 epicenters of important earthquakes were located within a few days after their occurrence.

Two seismological stations in Greenland resumed contact with their sponsor, the Geodetic Institute of Denmark, Copenhagen, after the end of the war in Europe. During the war period they were furnished supplies through the Coast and Geodetic Survey. Several other stations in the western hemisphere were given similar aid.

The Executive Committee of the International Union of Geodesy and Geophysics, with which the International Seismological Association is affiliated, met in December 1945 to discuss reorganization and resumption of its former activities. The *International Seismological Summary*, a unit of Oxford University which calculates and publishes earthquake locations for the entire world, and which is sponsored in part by the International Union, continued to function throughout the war.

VOLCANOES—MEXICO

Volcanic activity apparently increased over 1944. Paricutin Volcano in Mexico continued to receive the greatest attention. The program of scientific observation was expanded, active parts being taken by a special Mexican Research Committee and an American Committee representing organizations associated with the Government, several leading universities, and a number of privately endowed institutions. The American Committees' research was facilitated through the acquisition of a helicopter. The Mexican Committee published a voluminous report on its findings to date. There was an overall decrease in explosive activity and flow of lava during the year, early spring marking a period which might be considered one of transition from continuous to intermittent activity. There were occasional falls of ash in Uruapan, 16 miles southeast of the volcano. No significant increase in the extent of the lava field was reported.

VOLCANIC ACTIVITY IN THE PACIFIC AND CARIBBEAN

Minor activity was reported from widespread points in the Pacific. Kluchevskaya, on Kamchatka peninsula, was in eruption beginning Dec. 11, 1944. On Dec. 30, 1944 activity on Alamagan Island (latitude 17°36′ north; longitude 145°50′ east) was reported by a passing ship. The sky was illuminated and there was a band of fire around the volcano.

On April 4, 1945, Llaima Volcano, 370 miles south of Santiago, Chile, was observed, from a plane, erupting lava and ashes from two craters. There was a smoke column 1,000 feet high. On April 30, 1945, smoke and flames, apparently of volcanic origin, were observed from a plane in the center of Matthew Island (latitude 22°20′ south; longitude 171°19′ east). A despatch dated Aug. 23 reported Mount Ruapehu, 120 miles north of Wellington, New Zealand, in eruption and spreading white ashes 50 miles around. A small volcanic island discovered off the Caribbean coast of Colombia on May 19, 1945 was reported to have disintegrated as a result of volcanic activity during July. Beginning Sept. 15, several smoke clouds were observed for short periods of time over Crater Lake in Oregon, with some indication of volcanic origin.

Several instances of discolored water, indicative of recent volcanic activity, were reported from the Pacific Ocean. On Jan. 21, a large mass of volcanic lava pumice, some pieces over a cubic foot in size, was reported in the Tonga Island region. Five days later a volcanic pumice dust patch was encountered in the New Hebrides area. On May 15, the pumps of a ship crossing the Aleutian trench near Unalaska Island picked up water containing a substance resembling volcanic ash, and excessive phosphorus particles were noticed on the surface of the ocean.

In the latter part of 1944, seismic observations at Kilauea Volcano in the Hawaiian Islands indicated greater activity than at any time in the past ten years.

MINERALOGY AND PETROGRAPHY

By Clifford Frondel
Department of Mineralogy, Harvard University

SYMPOSIA ON QUARTZ OSCILLATOR-PLATES

The spectacular development of the quartz oscillator-plate industry during the war is described in a Symposium of 14 technical papers recently published by the Mineralogical Society of America (*Amer. Min.*, vol. 30, 205-468, 1945). Another Symposium in the same general field will shortly be published by the American Association for the Advancement of Science. Production statistics and much of the technical information in the field have hitherto been withheld for reasons of military security. The tiny quartz plates were used in almost fantastic numbers as frequency controls in military radios. In this application, the alternating electrical field generated by the vacuum tube radio circuit is applied to a quartz plate, properly cut and mounted and so dimensioned that one of its natural frequencies of mechanical vibration coincides with the oscillations of the circuit, and the frequency of transmission or reception is thereby stabilized and precisely controlled. Quartz, rather than other natural or artificial crystals, some of which give much more pronounced piezoelectric effects, is employed for the purpose because of its chemical and physical stability, high elasticity, and availability.

In the twenty-year period from the first application of quartz to radio to the outbreak of the Second World War only a few hundred thousand quartz plates were made in the United States. Driven by insistent demands of the Armed Services for immediate and large production, roughly 65,000,000 units were delivered from the outbreak of war to July, 1945. About 20 per cent of the production went into tank and other ground vehicle radios, 30 per cent into aircraft radios, and most of the rest into walkie-talkie and other portable combat sets. Separate figures are not available for Lend-Lease shipments but at least several million units were sent to the United Kingdom and other Allied countries. Technical information and manufacturing equipment also was supplied to Russia and other Allied countries.

INDUSTRIAL PROBLEMS IN WAR PRODUCTION OF QUARTZ PLATES

The problem of taking a pre-war laboratory-scale industry and converting it to a mass-production basis presented an industrial problem of the first magnitude. The responsibility for initiating and guiding procurement for the Army and Air forces rested largely in the Quartz Crystal Coordination Section, General Development Division, Office of the Chief Signal Officer, War Department. This group was activated under a directive of March 5, 1942, from Major General (then Brigadier General) Roger B. Colton, Chief of the Materiel Branch,

U. S. Army Signal Corps. The Crystal Section, housed in the Pentagon Building, Washington, comprised a small group of civilian and Army technicians and scientists. The Crystal Section was aided in its task by the Crystal Branch of the Signal Corps Laboratories at Fort Monmouth, New Jersey, and later by the Aircraft Radio Laboratories at Wright Field, Ohio. The Fort Monmouth Laboratories were active primarily in placing educational orders enabling manufacturers to get set up, in awarding development contracts on equipment and technical problems, and in research. The Crystal Branch of the ARL, beginning in 1943, did valuable laboratory and field work and contributed to the increase in quality of both oscillator-plates and holders. Special acknowledgment also should be made to the Bell Telephone Laboratories and the Western Electric Company, which supplied invaluable technical information and led in the development of several types of manufacturing equipment.

The raw quartz used in the industry came almost entirely from Brazil. A stockpile of some millions of pounds was built up in the United States by the Metals Reserve Corporation, the material being graded by the National Bureau of Standards, and this and privately imported quartz were allocated to industry by the Miscellaneous Minerals Section of the War Production Board. Most of this quartz contained natural crystal faces and hence was relatively easy to orient and handle during manufacture. Broken, unfaced quartz was relatively abundant and cheap but efforts to equip and teach the industry to process such material met with reluctance. Among the principal difficulties confronting the newly established industry were uninformed management, scarcity of skilled personnel, and general lack of technical information pertaining to the practicalities of orienting quartz and cutting plates therefrom. The pre-war experience of many of the new and hastily created manufacturers was in such fields as the manufacture of lamp shades, transformers, neon lights, grindstones, and sound recording apparatus. One was an undertaker. More than one of these new companies soon were producing more quartz radio plates in a week than the whole country did in the full year 1939. The cost of tooling up and doing the job amounted to about a third of a billion dollars.

On VJ Day almost all outstanding government contracts were terminated and the industry came to an abrupt halt. There undoubtedly will be a large and continuing demand for radio plates from commercial sources, and the post-war industry will be large as compared to pre-war standards, but the present productive capacity is so enormous that most manufacturers will be forced to close down permanently. New uses for quartz also may be expected to develop. Ultrasonic radiation generated by X-cut quartz plates may find large-scale employment in chemical, pharmaceutical, and other industries. Home radios also may be fitted with quartz crystals, and the application of quartz filter plates to coaxial telephony will continue to be important. Any large scale development of portable, walkie-talkie types of radios also would require the use of crystal controls.

TOURMALINE

Tourmaline, hitherto valued principally as a semi-precious gemstone, found important application during the war in the manufacture of gauges for the measurement of transient blast pressures. The use of tourmaline for the purpose derives from its property of developing an electrical charge when subjected to properly directed pressure. The charge thus generated can be measured directly and is a measure of the pressure. Quartz also is piezoelectric, but it is not sensitive to hydrostatic pressures. As with other essential war minerals, the demand for raw material soon outstripped the supply, and intensive efforts were made both to develop domestic sources of supply and to import material. A small amount of material was obtained from granite pegmatites in the United States, but unfortunately most of the high grade tourmaline had been mined prior to 1940 and sold in China as an ornamental stone. Little or no tourmaline appears to have been stockpiled prior to the war. Madagascar and Brazil are the principal foreign sources of supply. Efforts to develop artificial materials as substitutes have met with considerable success, but the application of most artificial substitutes is restricted by their relatively high solubility and low mechanical strength. Several of the artificial substances developed for this and other applications of piezoelectricity are now in large scale production.

DETWINNING QUARTZ

A large percentage of the thousands of tons of raw quartz imported into the United States in recent years has been unusable because of the presence of an internal defect, known as twinning, in which two or more individual quartz crystals are intergrown at angles one to the other. Research work has been undertaken in government and other laboratories in an effort to find methods by which the defect can be removed artificially. The principal method employed involves heating twinned quartz wafers to a temperature over 573° C at which point the quartz undergoes an atomic rearrangement in such way that the twinning disappears. The conditions of cooling are then so controlled that the quartz wafer reinverts as a single crystalline individual instead of a twinned intergrowth. Promising results also have been obtained by subjecting twinned quartz to intense electric and magnetic fields at high temperatures. The fields tend to orient the tetrahedra of silicon and oxygen atoms composing the substance all in a common position and thus remove the twinning.

MICA IN NEW ENGLAND

The urgent wartime need for high grade sheet mica for electrical insulation led to an intensive search for and exploitation of domestic sources of supply. Field studies were undertaken by experts of the U. S. Geological Survey in the principal mica-producing districts and further impetus was given to the program by high government price subsidies. More mica mines were operated in the United States during the war than in any previous period, but the country still is not self-sufficient especially with regard to electrical mica of top quality. It is said that the Germans developed methods during the war of making mica artificially but no similar work seems to have been carried on here. In the New England area over 200 mica deposits were mapped and studied in detail by the Geological Survey and the data obtained applied to problems of mining, exploration for new deposits, and estimation of reserves. A description of this work has been published (*Econ. Geol.,* vol. 40, 461, 1945). The mica, which is of the muscovite type, occurs in granite pegmatites. The principal producing districts are in Maine, New Hampshire, and Connecticut.

SYMPOSIUM ON DIAMONDS

A notable Symposium of 17 papers on the structure and properties of the diamond has been published (*Proc. Indian Acad. Sci.,* Sect. A, vol. 19, 189,342,944). The crystal symmetry and atomic structure of the diamond is discussed by Sir C. V. Raman, who suggests that four different types of structure exist. In these, the positions of the carbon atoms are similar but the orientation of the tetrahedral carbon atoms in the lattices differ. Two of these structures are tetrahedral and two are octahedral. The four positions of the carbon atoms correspond to the four different ways of securing extinction of the resultant magnetic moment. Mixture of the several types of structure may occur within the same diamond crystal. The well known Type I diamonds, exhibiting infrared absorption, consist of either of the two tetrahedral forms or of both in twin position. Other papers in the Symposium describe the nature and origin of the luminescence effects produced in the diamond by ultraviolet light and x-rays, and the birefringence patterns seen in polar-ized light. Birefringence in diamonds is of two types: irregular, and owing to accidental imperfections such as inclusions; and structural, owing to a difference in the atomic spacing of the structural types of diamond composing the crystal. The Type I diamonds which possess blue luminescence are isotropic, showing that the two interpenetrating tetrahedral variants of the diamond structure possess identical atomic spacings.

DESCRIPTIONS OF NEW MINERALS

The number of new mineral species described during the year is relatively small, as in past war years, because of the diversion of mineralogists to other more urgent tasks. The name, eckermannite, has been given to a new alkali amphibole from Sweden. The supposed species, katangite and treanorite, have been shown to be identical with chrysocolla and allanite respectively. Yenerite is an ill-defined lead and antimony sulfosalt probably identical with boulangerite. A new hydrous iron sulfate from France, named pseudoapatelite, is related to apatelite and borgstromite, and all perhaps are identical. A new barium-feldspar has been termed banalsite; it occurs with various manganese minerals at the Benallt mine, Wales. Viseite is a supposed new phosphate-silicate from Belgium. The rare mineral simpsonite, an oxide of aluminum and tantalum previously known only from Australia, has been found in commercially important amounts in pegmatite deposits in Brazil. Jusite is a fibrous zeolite-like mineral found in cavities in an alkalic igneous rock in the Schwabian Alps. A number of other mineralogical investigations, among them studies of the uranium minerals, have not yet been reported because of military restrictions.

TERRESTRIAL MAGNETISM AND ELECTRICITY

BY JOHN A. FLEMING

DIRECTOR, DEPARTMENT OF TERRESTRIAL MAGNETISM,
CARNEGIE INSTITUTION OF WASHINGTON

GENERAL

Although the Second World War came to an end in the course of the year, the general confusion attending demobilization and reconversion made impossible a complete resumption of pre-war activity in geophysical science. Particularly has international cooperation, upon which geomagnetic research so largely depends, been greatly limited by operations connected with the war. In spite of difficulties, however, considerable progress along certain lines has been made, and because of it special investigations have been brought to a successful conclusion, the results of which may not be published at the present time.

Despite the fact that vast improvements in our knowledge of the distribution of the Earth's magnetic field have resulted from work in the past few decades, our knowledge remains insufficient for solving various theoretical and practical problems.

This desideratum has been keenly felt in magnetic cartography particularly in connection with the production of magnetic maps during the war. Small ships, as in the merchant marine, depend upon the magnetic compass for navigation. Sufficiently accurate charts for navigation could not be drawn directly from observations, and it was necessary to have recourse to mathematical adjustments to furnish a more accurate representation of the field than could otherwise be obtained, but they can never compensate for the absence of observations. Observations are not only far too few but they are not distributed over the Earth's surface with uniform density.

MAGNETIC OBSERVATIONS FROM AIRCRAFT

There is a good prospect that this condition may soon be remedied by magnetic observations from aircraft. In flight above the surface of the Earth, an airplane is farther away from magnetic anomalies which affect the value of surface observations. By employing aircraft, a survey of the surface of the entire Earth would be possible in a relatively short time as compared with surveys made heretofore employing other means of travel. The accuracy of newly developed techniques, thanks to achievements during the war, can be kept more than adequate for practical and theoretical purposes.

An example of what can be achieved by such methods is supplied by the flight of the *Aries* under the sponsorship of the Empire Air Navigational School in August 1945. In the course of flights over an entirely different region, each flight occupying less than 24 hours, a new position of the North Magnetic Pole was determined, probably more accurately than ever before. On the flight use was made not only of magnetic compasses of various types but also of a three-element, saturated-core type magnetometer. The instrument was not designed for this flight but for measurements of a lower order of accuracy; yet the smoothed values of the observations obtained with it seemed to be consistent. This pioneer work demonstrates what may be expected when full advantage is taken of the technical progress of the last five years, and it is likely that the coming years will see a more extensive program of this kind in America.

INTERNATIONAL MEETINGS

In December 1945 meetings were held of the Executive Committees of the International Council of Scientific Unions (London, Dec. 4-5) and of the International Union of Geodesy and Geophysics (Oxford, Dec. 10-17) to consider resuming the complete program of the International Council and of the International Unions. The American representatives in attendance at these meetings were John A. Fleming, President, International Association of Terrestrial Magnetism and Electricity, Richard M. Field, Chairman, International Commission on Continental and Oceanic Structure, and Walter D. Lambert, Member of the Bureau of the International Association of Geodesy. In the Association of Terrestrial Magnetism and Electricity of the International Union a large part of the regular international program of geomagnetic activities has been maintained during the war, and it is hoped that the arrangements made at London will soon bring about complete international cooperation of all nations interested in geomagnetism. It is expected that the eighth triennial assembly of the International Union of Geodesy and Geophysics, which was to have been held in Bergen, Norway, in 1942, but which was postponed because of the war, will be held either in the summer of 1946 or of 1947 at Bergen.

UNITED STATES OBSERVATORIES

The United States Coast and Geodetic Survey maintained in operation its five magnetic observatories. The international magnetic standards were maintained at the Cheltenham Magnetic Observatory of that Survey, in collaboration with the Department of Terrestrial Magnetism of the Carnegie Institution of Washington. This cooperation included also a complete atmospheric-electric program at the Tucson Magnetic Observatory.

CANADA, GREENLAND, ALASKA

The observatories at Meanook and Agincourt, Canada, were operated by the Dominion Observatory as heretofore. In Greenland, the Godhavn and Ivigtut magnetic observatories obtained complete magnetic records throughout the year.

The College Observatory, located at the University of Alaska, continued to be operated by the Department of Terrestrial Magnetism of the Carnegie Institution of Washington, in cooperation with the University of Alaska. Continuous records were obtained as follows: (1) Three magnetic elements, declination, horizontal intensity, and vertical intensity; (2) rate of change of geomagnetic horizontal intensity; (3) height- and penetrating-frequencies of the ionospheric regions; (4) electric field-strength of radio waves from selected high-frequency broadcasting stations in the United States, England, and Japan; (5) direction of arrival and instantaneous field-strength of high-frequency radio signals.

The auroral studies so far made clearly indicate a lack of detailed correspondence between ionospheric phenomena and visible zenith aurora, although the gross correlation continued to be present.

SOUTH AND CENTRAL AMERICA

The programs in geophysics were continued throughout 1945 in Argentina at observatories of Pilar, La Quiaca (South Orkneys), and San Miguel, in Brazil, at the Vassouras Observatory, in Colombia at the National Observatory of San Bartolomé, and in Mexico by the Magnetic Section of the National Astronomical Observatory of Mexico at Teoloyucan.

SURVEYS

South and Central America.—A magnetic party of the United States Coast and Geodetic Survey has resumed the observations in a few South American countries. As during 1944 the work is being done this year in cooperation with the respective countries and is sponsored by the Department of State. Observations have been made at a number of stations in Mexico, Bolivia, Chile, Peru, and the Galapagos Islands. The intensive survey of Uruguay is in progress under the auspices of the Military Geographic Institute of that country; it is expected to include about 65 magnetic stations.

The magnetic survey of Argentina has been continued and it is planned to keep one party in the field during the entire year of 1946. Isomagnetic charts for Argentina for the epoch 1944.0 have been prepared for publication but only the isogonic chart has been issued, the others being withheld for the present. It is hoped that the isomagnetic lines may be extended to the neighboring republics and to the Atlantic and Pacific oceans.

United States.—A party of the United States Coast and Geodetic Survey has made magnetic and seismological observations in the vicinity of Parícutin Volcano in Mexico. The project is sponsored by the Department of State and carried out in cooperation with several other American and Mexican scientific agencies.

An automatically recording declinometer was set up in Gatlinburg, Tenn., Sept. 3, 1945; the recorder of this instrument is a modified electrocardiograph recorder and is so designed that it will operate several months without attention. It is designed primarily to obtain accurate information on secular change at a cost comparable with that of obtaining much less accurate data by ordinary repeat observations.

Canada.—Flights from a base in Canada over the North Magnetic Pole in Boothia Peninsula are being planned by the Empire Air Navigation School of the R.A.F. Flying Command. The objects of these flights are stated to be to examine the behavior of compasses and automatic dead-reckoning gear and to collect data on engine handling as well as magnetism and meteorology.

World.—The program of geomagnetic work at the Watheroo Magnetic Observatory in Western Australia operated by the Carnegie Institution of Washington was continued. The geomagnetic program at the Apia Observatory in western Samoa was also maintained by New Zealand. The Carnegie Institution of Washington continued to give assistance, through loans of instrumental equipment, to observatories in South Africa, Belgian Congo, Mauritius, and New Zealand.

GEOMAGNETIC RESEARCH

At the Department of Terrestrial Magnetism, the voluminous tables required in the reduction of magnetic observations to epoch and for the natural magnetic variations and disturbances and cosmic variations, were extended so as to cover the period from 1905 through 1944. The reductions of field-stations to the four epochs 1912.5, 1922.5, 1932.5, and 1942.5 were completed for over 10,000 stations on land and sea. Isoporic charts for the world for declination and horizontal intensity for these four epochs were completed and others for the remaining elements of northward, eastward, vertical, and total components and of inclination are nearing completion.

A theoretical examination of the problem of adjusting isomagnetic charts to mutual consistency was completed.

Calculations were made for continuation of magnetic fields on a plane or a sphere to adjacent regions of space.

Analytical and computational procedures for the analysis and interpretation of geomagnetic anomalies were developed, relating particularly to techniques of geophysical prospecting by the magnetic and gravitational methods. Relations among the surface-components of field and their gradients were compiled, and techniques of analysis using models, Fourier series, Fourier-Bessel series, power-series, and surface integrals described. These permit, under favorable conditions, useful inferences regarding sub-surface structure of advantage in prospecting for certain minerals and petroleum.

The geomagnetic disturbance daily variation (S_D) was derived for stations in southern auroral regions. Little evidence was found of important differences in the average characteristics of geomagnetic disturbance in southern as compared with northern polar regions but more observations are necessary before a definite conclusion can be reached.

Isolines of equal daily and hourly percentage-frequency of occurrence of visually observed aurora were mapped for the southern hemisphere. The extent and frequency of expansions of the auroral zone during magnetic storms is being studied, using geomagnetic as well as auroral data.

The geographic incidence of aurora and magnetic disturbance in the southern hemisphere was studied, using observations at about 40 auroral stations and 13 magnetic observatories. The position of the southern auroral zone was estimated from geomagnetic data and compared with observations of aurora. Tentative isochasms were drawn for aurora observed in the absence of cloud, results being corrected also for the influence of sunlight on observing conditions, and they appear to resemble closely corresponding isochasms for the northern hemisphere. Lines of equal average hourly percentage-frequency of aurora were mapped for the northern hemisphere for several positions of the Sun relative to the Earth. Average position of the northern auroral zone for the various years of the sunspot-cycle is being derived.

GEOELECTRIC RESEARCH

At the Department of Terrestrial Magnetism some modifications and improvements have been made in the CIW ionization-meters, and particular attention was directed to effects of secondary radiation, "volume-contamination," and "wall-contamination."

An important program was begun on adaptation of electronic circuits to atmospheric-electric instruments in place of electrometers. This resulted in improvements in investigation of rapidly varying fields associated with thunderstorms and in observations under difficult operating conditions, for example, on airplanes in storm regions.

It was found by tests that the diminution in the rate of ionization which occurs when people occupy a room is owing to a diminution in the radon and thoron content of the air. For equilibrium-conditions the alpha-ray ionization inside a room was found to be about double the gamma-ray ionization. The ratio is about 50 per cent greater than that obtained from estimates by Eve for air under out-of-doors conditions.

The small-ion content of the air was found to vary directly as the rate of ionization, becoming zero when the ionization is zero. Results indicate that the recombination-coefficient between small and large ions varies with the rate of ionization.

The probable errors of a single observation in measurements of ion-content and air-conductivity at sea were determined from analysis of results obtained during the last three cruises of the *Carnegie* to be about 12 per cent. The average error for each instrument also appears to be systematic and of such a nature as to give too low a value for the element measured, perhaps not over one per cent in mean values.

Research on seasonal changes in the diurnal variation of earth-currents and the geomagnetic field from 12 years of record at Tucson, Ariz. was completed. The changes were found consistent with effects attributable to recognized current-systems in the ionosphere northward and southward from the sun. Two anomalous features disclosed over the regular season changes were explained as probably owing in one case to space-variation in the conductivity of the ionosphere and in the other to erratic shifts in the latitudes of current-centers.

IONOSPHERE

Additional important contributions to improve radio-communication circuits resulted from continuous ionospheric data at Huancayo, Watheroo, College (Alaska), and five other stations established outside the continental United States.

The active program of research and development and the instruction of observers were continued at the Kensington Laboratory and at several field-stations. These resulted in design and construction of improved and simplified manually operated ionospheric equipment.

Seasonal features of sporadic-E already established for the northern hemisphere were confirmed for the southern hemisphere. Tests for recurrence-tendency with the 27-day period of solar rotation did not show positive correlation.

Further attention was devoted to the post-war observational program and items of research among which the most important are (1) completion of program at the Huancayo and Watheroo observatories to cover a full sunspot-cycle, (2) extended analyses of accumulated data, and (3) new projects directed toward specific problems which promise positive solutions in a reasonable length of time.

COSMIC RAYS

The end of the Second World War will make possible resumption of the active discussion and interpretation of the data accumulated by the various groups of investigators who have been cooperating with the Carnegie Institution of Washington in the program of the Committee on Coordination of Cosmic-Ray Investigations. It is expected that the programs of several of these groups hitherto engaged in war work will be resumed during 1946.

Dr. Korff of New York University reports on research on counters, on measurements of neutrons produced by cosmic radiation, and on the construction of a narrow-angle wide-aperture telescope. Prof. V. F. Hess of Fordham University has concerned himself with measurements and interpretation of studies of atmospheric ionization. Prof. Marcel Schein of the University of Chicago group has been engaged on investigations of the intermediate particles and mesotron production in the stratosphere.

In spite of difficulties occasioned by the war, the continuous recordings of cosmic radiation were continued with only minor interruptions at Cheltenham, Huancayo, Teoloyucan, Christchurch, and Godhavn. Continuous and homogeneous series of data at well-distributed stations over the Earth's surface have been realized since 1936 and 1937 at four of the stations and since 1938 at Godhavn. Accordingly, by 1949 or 1950, the records will include at least a complete sunspot-cycle for all five stations. These data should be ample for statistical analyses concerning possible seasonal effects in different localities, solar-day, lunar-day, and sidereal variations, worldwide changes, and geomagnetic correlations. These analyses, together with data on the high atmosphere resulting from numerous determinations above different points on the Earth's surface and parallel coordinated researches in the laboratory, will certainly improve understanding and interpretation of cosmic radiation.

PUBLICATIONS

The United States Coast and Geodetic Survey has published the magnetic results of the Cheltenham Magnetic Observatory for 1935-36, and "Alaska magnetic tables and magnetic charts for 1940," the latter reproduced by offset lithography. In addition, there are in press the magnetic results for Tucson during 1935-36, for San Juan during 1929-30, for the Polar Year Observatory at College (Alaska), and for magnetic observations in the American Republics during 1941-44. The "Magnetism of the Earth," replacing the earlier publication "The Earth's Magnetism," was issued about the middle of the year. About one-half of the area of the Earth has been covered by the series of isogonic charts on a scale of 1,500,000. The chart of the United States belonging to this series will soon be completed. Work was also started on the manuscript of "Magnetic Declination in the United States in 1945." It is expected that this publication will be issued early in 1946.

The American Geophysical Union held its 26th Annual Meeting in Washington, D. C., May 31 and June 1, 1945. Its *Transactions* are now being published in the form of a bimonthly journal, and the issues for August, October, and December, 1945, have appeared. Their contents are assembled in departments under the following classification: Papers; Discussions; Progress-reports; Letters to Editor; Reviews, Abstracts, and Bibliography; Notes and Personalia; Union, Section, and Committee Activities.

The quarterly *Journal of Terrestrial Magnetism and Atmospheric Electricity,* published by the Johns Hopkins Press, completed its 50th volume in 1945 thus rounding out a half-century of outstanding service to the fields of geomagnetism and geoelectricity. It contains original articles and sections on magnetic storms, on magnetic-activity indices, letters to the Editor, notes, and lists of current publications.

There are in press two final volumes of the "Results of Cruise VII of the *Carnegie* during 1928-1929, under command of Captain J. P. Ault." These are entitled *Ocean Atmospheric-electric Results,* and *The Work of the Carnegie and Suggestions for Future Scientific Cruises* (future magnetic, electric, and oceanographic surveys).

METEOROLOGY AND CLIMATOLOGY

By F. W. Reichelderfer
Chief, U. S. Weather Bureau

GENERAL

Tremendous expansion of air power prior to and during the war and the great increase in transoceanic air transportation gave an unprecedented stimulus to meteorology, and its effect on the field in general will be remembered for many years. The sudden demand for trained meteorologists led to education at the professional level of a large group of young men with basic training in mathematics and physics. The increase in the number of professional meteorologists prompted leading men in the field to suggest reorganization of the American Meteorological Society into a strong professional organization that will insure continued progress in meteorology. The plan was formally approved, and the American Meteorological Society is now composed of two groups of members, professional and non-professional. The field of meteorology is certain to benefit by the changes which have been effected, and it is now ready to take its place with the other physical sciences.

RESEARCH IN WEATHER FORECASTING

Research in the field of meteorology, as in other wartime years, has generally been of a practical nature, with emphasis on the solution of meteorological problems of direct military significance. The wartime problems of meteorology, however, were like those of peacetime, though need was even more urgent for methods of preparing weather forecasts of greater accuracy and for longer periods of time. Associated with this was the demand for methods of measuring more accurately the characteristics of the free atmosphere, especially during times of adverse weather conditions.

Progress in improving weather forecasting techniques continued slowly, and there is no evidence that the methods yet developed are sufficiently reliable to predict the weather with useful accuracy beyond a few days in advance in most meteorological situations. Research into methods of preparing forecasts for periods of two to six days in advance by the use of charts of mean conditions, was continued by the United States Weather Bureau. Similar work was carried on in cooperation with the Weather Bureau by the Department of Meteorology of the Massachusetts Institute of Technology, where this method of extended forecasting was initiated seven or eight years ago. Work of this type is described in "Studies of the Motion and Development of Long Waves in the Westerlies," by Namias and Clapp, in the *Journal of Meteorology* for December, 1944.

SPECIAL PROBLEMS AND STUDIES

Advances in methods of preparing weather forecasts of greater accuracy for one or two days in advance have been minor. Research has been chiefly on special problems of relatively small areas and not on techniques of forecasting applicable to large regions of the world. The project for investigation of the formation of stratus clouds along the west coast of the United States was continued by the Department of Meteorology of the University of California at Los Angeles in cooperation with the Weather Bureau, Army Air Forces, and Navy. A study of the formation and development of storms in the Atlantic coastal region was made by the Department of Meteorology of New York University with funds provided by the Weather Bureau. The study included theoretical as well as practical aspects of the problems, and it is being continued under the sponsorship of the Army Air Forces. The investigation of the causes of thunderstorms in the central United States was continued by the University of Chicago.

Studies of a theoretical nature, normally carried on by universities or institutes, have not been numerous. Staff members of the various meteorological departments have been on leave in connection with special wartime assignments or busy with relatively heavy teaching loads. A study on horizontal mass divergence in atmospheric waves was completed at the University of California at Los Angeles, and an investigation into the methods for the determination of the field of vertical motion in the atmosphere was carried on at New York University.

The United States Weather Bureau, in its research on day-to-day forecasting, emphasized the application of engineering techniques to forecasting methods with the purpose of developing objective rules to replace or supplement the subjective methods now commonly employed. As a beginning, objective methods of forecasting minimum temperatures and occurrence of precipitation for several stations were devised.

Developmental work on meteorological instruments for measuring the characteristics of the upper air was carried on mainly by the Army Signal Corps, the Navy, and the University of Chicago. Application of recent developments in the field of electronics has provided new methods for determination of the wind in the upper air. Advantages of these new methods are that wind can be measured in and above cloud layers and during precipitation, and that the measurements at high altitudes can be made with greater accuracy. Work on problems in the measurement of temperature and humidity with various types of radiosonde was continued by the instrument laboratories of the Weather Bureau and the University of Chicago as well as by the Army Signal Corps. Some progress was made, but many problems remain unsolved.

METEOROLOGICAL TRAINING

To meet the needs of the Armed Forces for meteorological officers during recent years, intensive one-year professional courses in meteorology have been given by the several universities and institutes with meteorological departments. Through this training program, some 5,000 persons have been prepared for practical meteorological work. With the release of weather officers from the Armed Forces, meteorology, unlike other physical sciences, has an oversupply of persons with basic professional training. Therefore, schools offering professional courses are now discouraging those who wish to begin the study of meteorology, but are encouraging those who completed the special wartime courses to continue their study toward advanced degrees if they have the necessary ability.

INDUSTRIAL METEOROLOGY

A new field of meteorological service to private industry that has been made possible by technical progress during the last decade or two, and is now being opened up as meteorologists are released from the Army and Navy, is the private practice of applied meteorology. Business and industry can be served by company meteorologists in a continuous and specialized manner that is beyond the normal scope of Weather Bureau functions. The private consultant in meteorology can conduct individual company studies to find ways to increase production, to decrease operating costs, and reduce losses of perishable goods, through more intensive use of meteorological knowledge, current weather reports, and forecasts. A beginning has been made in the development of micrometeorology and localized weather forecasting for special uses. The results have been fairly satisfactory, and they give promise of lucrative practice in this relatively new private professional field.

UPPER AIR ANALYSIS

Analysis of the upper air during recent years in the United States has been carried on in part through constant level charts. For this purpose, however, many countries have employed constant pressure charts. The methods of analysis of these two charts are much alike, but the data used on them very different. In order to bring about international standardization in upper air analysis, for the purpose of facilitating the use of upper air data in weather forecasting and research, a change from constant level to constant pressure analysis was begun in the Weather Bureau on May 1.

CLIMATOLOGY

In connection with the long-range planning of the Armed Forces, the analysis of climatological data was accomplished on a large scale by improved methods, involving the recording of weather data on punched cards and summarization by machine methods. By this process, frequency distributions, summaries of means and extremes, and probabilities of occurrence with known reliability were determined quickly for all weather elements desired and for any region for which data were available. As a result, millions of weather observations are now recorded on punched cards, ready for further analysis, and methods of analysis have been developed. These need to be supplemented and utilized to get full value out of the climatological data in the interests of industry, agriculture, and business.

PUBLICATIONS

The Air Transport Association of America, through its Meteorological Committee, sponsored a new publication, the *Journal of Aeronautical Meteorology*. It will appear quarterly and is designed primarily as an outlet for technical and semi-technical papers in aeronautical meteorology.

The first issue of the *Journal of Meteorology*, the new periodical of the American Meteorological Society, appeared in February, 1945. This publication was established to provide a means for the dissemination of original papers in theoretical and applied meteorology. The American Meteorological Society will continue to publish its *Bulletin*, in which papers dealing with less technical aspects of the science will appear as well as survey papers, reviews, notes, and announcements.

The American Geophysical Union, which has a Section of Meteorology, began publishing its *Transactions* on a bimonthly basis instead of annually as in the past. The first bimonthly issue of *Transactions* appeared in August.

New books published during 1945 included: J. Holmboe, G. E. Forsythe, and W. Gustin, *Dynamic Meteorology* (New York, John Wiley and Sons); R. W. Mudge, *Meteorology for Pilots* (New York, McGraw-Hill); F. L. Caudle, *Workbook in Elementary Meteorology* (New York, McGraw-Hill).

AMERICAN EXPLORATION

By Robert M. Brown
Rhode Island College of Education

AMERICAN MUSEUM OF NATURAL HISTORY

Nyasaland.—The American Museum has announced the resumption of expeditions to distant lands, which had been discontinued since 1941, by an expedition to Nyasaland, South Africa, under the leadership of Arthur S. Vernay. The personnel, in addition to the director, include Dr. Harold E. Anthony, mammalogist, Leonard Brass, botanist, and Captain Guy Shortridge, director of the Kaffrarian Museum of King William's Town, South Africa. Specimens of the smaller animal life and of the plants will be collected with the object of having on record as complete a picture of the flora and fauna of Nyasaland as can be obtained. The expedition planned to be in the field and ready to work at the beginning of the dry season in April, 1946. The collections will be deposited in the Kaffrarian Museum, the New York Botanical Gardens, and the American Museum.

Archbold Biological Station.—The Archbold Expeditions, Inc., withheld from expeditions during the war, established a home base in south-central Florida a few miles west of Lake Okeechobee on a 1,000-acre estate, the gift of John A. Roebling. The Archbold Expeditions have made many successful journeys to the East Indies for the purpose of collecting mammals, birds, and plants, and plans had been made to continue this work, but because the war prevented the fulfillment of these, the Florida Station was established as a permanent home for the expedition organization, and the attention of the personnel was directed towards biological researches within the United States. Such studies as the life history of the round-tailed muskrat, collections of insects and spiders, life history of the Florida jay, and the ecology and behavior relations of the associations of ants and termites, have been undertaken.

NEW YORK BOTANICAL GARDEN

The Staff of the Garden is planning, now that the war is over, for a greater extension of display areas in order to carry on more work of world-wide scope and to provide more ornamental displays and educational facilities in the field of botany and gardening. During 1945, some explorations were undertaken in North and South America. Dr. Bassett Maguire, curator of the Garden, conducted an eight months exploration in British Guiana and Surinam; E. J. Alexander, assistant curator, led an expedition for botanical and horticultural materials in southern Mexico; and Dr. W. H. Camp assistant curator, collected specimens of plants in the Ecuador highlands.

SMITHSONIAN INSTITUTION

During the omission of the ordinary explorations of the Institution, the members of the Staff were engaged in gathering technical information for Army and Navy uses. However, the three observing stations of the Astrophysical Observatory were maintained with some difficulty because of the shortage of workers, in order to obtain a continuous record of the solar constant of radiation.

NATIONAL GEOGRAPHIC SOCIETY

The Society, with the cooperation of the Smithsonian Institution, continued its work in Mexico. Under the leadership of Dr. Matthew W. Stirling the seventh expedition conducted studies east of the Isthmus of Tehuantepec. Carved basalt heads of great size have been discovered dating back seven centuries, and near Tres Zapotes, Mayan symbols bearing the date of 291 B. C. were unearthed. Thus over the years important evidence of pre-Columbian cultures have been gathered.

THE COLLEGES

Dr. Alden H. Miller, curator of the Museum of Vertebrate Zoology and professor of Zoology at the University of California, was in Colombia early in 1945 collecting specimens of land birds and small mammals.

Dr. George S. Myers, professor of Biology at Stanford University, returned from Brazil where he spent two years. Among other activities, he led a number of ichthyological explorations in different parts of the country under the sponsorship of the Museum National at Rio de Janeiro.

Dr. Walter H. Bucher, professor of Geology, Columbia University, is in Venezuela at the request of the Venezuelan Government to aid in the preparation of a tectonic map of the country. The Venezuelan Geological Survey, various oil companies operating in Venezuela, and the Geological Society of America are concerned in the project.

GUATEMALA

The Government of the United States and Guatemala have signed an agreement for a long term experimental station in Guatemala to promote cinchona cultivation and to undertake other crop production investigations. Guatemala will provide land, laboratories, and the necessary accessories and the United States the scientific staff.

MEXICO

A United States Army Sikorsky helicopter made flights during the summer over Paricutin volcano to study the performance of this machine under conditions of high altitude, turbulence, and temperature similar to those of the Pacific war area, and to obtain close views of a volcano in action. For the former purpose Captain George D. Colchagoff and Flight Officer Roy P. Beer conducted the flights, and for the second, Dr. Ezequiel Ordonez, Mexican geologist, Dr. L. C. Graton, Harvard, and Dr. W. F. Foshag, United States Geological Survey, were present to take observations. The helicopter offered an unusual opportunity to study the volcano in close contact since it could hover within 300 feet of the rim. Observations of lightning flashes in and out of the crater were made, records of plant life within five miles of the crater were taken, and still and motion pictures of the activity of Paricutin were obtained.

CANADA

Pére Arthème Dutilly, missionary-botanist, with Abbé Ernest Lepage

Dagenais, Rimouski College of Agriculture, and Prof. Pierre Dagenais, Jacques Cartier Normal School, completed a journey across the northern tip of the Labrador peninsula from the gulf of Richmond to Ungava Bay, a traverse of 400 miles. Pére Dutilly collected over 4,000 specimens of plants which will be taken to the Catholic University of America in Washington where he is stationed during the winter months. The trip was in canoes up the Stillwater river and down the Larch and Koksook rivers to Ungava Bay.

DIVISION XXI

CHEMISTRY AND PHYSICS

PHYSICAL CHEMISTRY

By Hugh S. Taylor
Professor, Princeton University

GENERAL

As in preceding years, no attempt will be made to review the whole field of general and physical chemistry. Wartime restrictions still severely limit the publication of important work. Certain selected topics of broad general interest have been chosen to illustrate the nature of present progress. It must be remembered that such selection is an individual one, often dependent to a large extent on the writer's own interests. Over a period of years, it is hoped, however, that the more important lines of advance would be reviewed.

NEW ELEMENTS

The Smyth report has made known the existence of the new man-made elements, neptunium No. 93 and plutonium No. 94 by successive elimination of two β-particles from U239 obtained through neutron capture by U238. Their properties will possibly be discussed elsewhere in this annual report. Prof. Glenn T. Seaborg of California has announced recently, in Chicago, (*Chem. and Eng. News,* Dec. 10, 1945) that neptunium exists in three isotopic forms with masses 239, 238, and 237 of which the first is the important precursor of plutonium 239. The corresponding isotopes of plutonium studied have masses 239 and 238. The isotope of neptunium of mass 237 does not emit a β-particle to give a plutonium isotope of mass 237, but is, on the contrary, a very long-lived element (half-life 2.25 x 10^6 years) decaying by emission of an alpha-particle. The man-made plutonium 239 exists in nature. It has been shown to be present in pitchblende to the extent of 1 part in 10^{14} parts. It is present, in spite of its short life, probably because it is continuously formed by the absorption in U238 of some of the neutrons which are always present. Seaborg also reports the identification and properties of the elements No. 95 and No. 96, in the products resulting from the bombardment of U238 and plutonium 239 with high energy (40,000,000 electron volt) helium ions available in the Berkeley cyclotron. As of today, the periodic system consists of 96 identified elements; that is, there is now positively known at least one isotope, stable or radioactive, for each of the elements with atomic numbers from 1 to 96, inclusive.

During the year a paper by J. F. Flagg and W. E. Bleidner (*J. Chem. Phys., 13,* 269, 1945) indicates how the new techniques will be utilized to study the properties of man-made elements available only in micro-quantities. Their researches were directed towards the physical and chemical properties of the element masurium, No. 43, announced in 1925 by Noddack and christened with a name reminiscent of a German victory in the First World War. Perrier and Segrè in 1939 showed that it was a radioactive product of neutron and deuteron bombardment of molybdenum, with properties which cast doubt upon the original report of Noddack. Flagg and Bleidner have now shown that, in solutions which contain no more than one million millionth of a gram-atom per liter of this element in their solutions, they could determine the conditions of electro-deposition of this element, the potentials under which it was deposited; the reactions of its compounds with zinc, iron, nickel, tin, lead, copper and mercury metals, hydrochloric acid and stannous chloride were also determined. This research is a pattern of what may be expected when data on the new man-made elements are released. It indicates how scientists were able to design huge plants for the production of plutonium from properties ascertained with micro-milligrams of material that could be adequately housed on a pin-head.

TRACER CHEMISTRY

The uranium fission process will provide chemists with a wide variety of isotopic species with which to study mechanism in all types of chemical reactions. The earliest tracer techniques were instituted with the naturally occurring radioactive elements. The isolation of stable isotopes, such as heavy hydrogen, heavy carbon, and heavy nitrogen, extended the available materials, the mass spectrograph being the essential analytical tool in these cases. The earliest nuclea disintegrations with alpha particles, protons, deuterons, and neutrons on the elements below the uranium series gave as many as 350 radioactive isotopes of atomic numbers between 1 and 90.

These are all potential agents for tracer researches. As an example, may be cited a recently published research in which radioactive iodine has been employed (Noyes, Dickinson, and Schomaker, *J. Am. Chem. Soc.*, *67*, 1319 (1945)). Iodine is an agent for the catalytic transformation of one structural form (cis) of the compound di-iodoethylene $C_2H_2I_2$ into the other form (trans). In the former (cis), the two iodine atoms are close to one another; in the other (trans), they are as far away from one another as possible. The interconversion is assisted by the presence of elementary iodine. If this is used with some included radioactive iodine as tracer, it can be shown (a) that the reaction either by heat or by light is determined by the quantity of the iodine that is present as atoms, (b) that simultaneously with the change in structure there is also an exchange process between the iodine atoms in the molecule di-iodoethylene and the atoms from the molecular elementary iodine, this latter process being easier and more rapid than the structural rearrangement.

This result with iodine parallels earlier experiments with heavy hydrogen, deuterium, in which it was shown that deuterium exchanges readily with the light hydrogen present in ethylene, more readily, under certain circumstances, than it adds to hydrogen to form the saturated compound, ethane. This earlier work showed that deuterium exchanges with the hydrogen in ethane much more slowly than with the hydrogen in ethylene. The parallel result with iodo-compounds is now forthcoming from the new research which shows that iodine atoms do not exchange with the saturated compound ethyl iodide under conditions where they exchange readily with the iodine in the unsaturated di-iodoethylene. Such observations are adding materially to one's knowledge of bond reactivities in compounds.

INFRA-RED SPECTROSCOPY

Since Robert Bunsen first made use, in 1859, of the spectroscope for the chemical analysis of metal salts, its use in this field has been constantly expanded. Used initially for identification of the light emitted by such ions as sodium and potassium when heated in the Bunsen flame, the spectroscope was extended to the ultra-violet region, and absorption spectra of many organic compounds became important analytical tools. Most recently the development of sources of infra-red radiation and of the techniques of spectral analysis in this region of the spectrum has permitted the identification of individual units in the total structure of large organic molecules by their capacity to absorb infra-red light of particular wave-lengths identified empirically with a particular arrangement of two or more atoms in such a complex molecule.

During recent years the usefulness of infra-red radiation and its power for qualitative and quantitative analysis have become widely appreciated, and its application to technical and industrial objectives has been rapidly extended. A simple example is the analysis of a mixture of butane and iso-butane, the latter of which is an agent in the production of high-octane fuels. These substances have the same atomic make-up, C_4H_{10}, are separable but with difficulty, since they boil closely together, but they are structurally different arrangements of the same atoms. This difference in structure is reflected in a difference of infra-red spectra with absorption bands at different infra-red wave lengths. By measurement of the absorption of light, at about 1170 wave numbers, absorbed strongly by isobutane but not by butane, a rapid and continuous analysis of the isobutane content of a mixture of these two gases can be secured.

The method has been applied recently in fields where previously ultra-violet absorption spectra were most frequently employed, for example, in the aromatic carbon compounds, derivatives of benzene. With these materials the advantage secured is that the absorptions in the infra-red are sharp characteristic bands whereas the ultra-violet are broad and continuous and frequently overlapping one another. Mixtures of cresols and, also, mixtures of xylenes recovered as by-products in the production of toluene from petroleum sources, are examples to which infra-red analysis has been applied. Another interesting example is the case of the new competitor to DDT developed by the British, called by them gammexane or 666. The active insecticide is hexachloro benzene, $C_6H_6Cl_6$, each carbon atom in a ring having one chlorine and one hydrogen attached to it.

There are at least four different arrangements of these atoms in the ring structure, and only one of them, the gamma form, has the desired powerful toxicity. Infra-red analysis is one tool of control of the synthetic methods used in the preparation of this product. This particular example forms an interesting example of secrecy in scientific matters during wartime. In the *Transactions* of the Faraday Society (April-May 1945) it was written of as "a spectacular example of outstanding interest and significance . . . of a crude solid product containing four stereoisomers . . . the details of this analysis will be published at some future date, but at present only the following notes may be given." By October 1945, the full details were published (See *Endeavor,* Volume IV, No. 16, pp. 148, 154).

Infra-red analysis has also entered the field of polymeric chemistry. As the polymerization proceeds from the single molecules to the polymer product, since new modes of linkage are produced in the polymer structure, these give rise to new absorption bands which may therefore be made the basis of analysis. In natural and synthetic rubber there are two centers of growth of polymeric materials. The growth may be end to end or straight chain, which the chemist identifies in the case of butadiene as 1-4 growth, or it may give rise to side chains which are identified as 1-2 growth. These two growths are important factors determining the properties of the polymer produced. The proportions in a product can be immediately determined by infra-red analysis because the different structural growth gives characteristic and different absorptions in the infra-red. In the same area are researches on the infra-red spectra of rubber in various stages and types of vulcanization. Studies have been initiated on the infra-red absorption spectra of coals in very thin sections, in pyridine extracts, and in "shock-heater" films, essentially a high-vacuum distillate deposited on a rock-salt plate. There are conspicuous infra-red differences between the thin sections and the others, pointing to chemical reorganization during solvent extraction and high-vacuum distillation.

RAW MATERIALS FOR SILICONE POLYMERS

In the last report the advent of a newcomer in the field of polymers was recorded with announcements of rubbery silicones by the General Electric Co. and silicone oils, waxes, varnishes, and resins by the Dow-Corning Corporation. During 1945, there were releases indicating methods whereby the single molecules from which such polymers can be constructed are manufactured. According to a series of papers issued from the Research Laboratories of the General Electric Co. (*J. Am. Chem. Soc.*, *67*, 963, 1057, 1545, 1772, 1810, 1813, 1945) such materials result from interaction of elementary silicon with a variety of organic halides preferably in presence of a catalyst such as metallic copper. Thus with methyl chloride and a sintered mass of silicon and copper powder, there is active interaction around 300°C with products approximating to $(CH_3)_2SiCl_2$ with more and less highly methylated constituents also present in the mixture. The dichlor dimethyl silicon compound is one of the important raw materials for preparation of the silicone polymers. Other groups can be substituted for methyl by analogous reactions. Bromine can be used in place of chlorine. The products are useful intermediates in the preparation of many other organosilicon compounds. The copper catalyst probably reacts first with the organic chloride, giving cuprous chloride and a copper methyl. These are the stages on the road to the final reaction of silicon with the chlorine and the organic radical. When chlorobenzene is used instead of methyl chloride, silver is preferred as catalyst to copper.

The work has been extended also to the reaction of organic chlorides with the tetrachloride of silicon, $SiCl_4$. In this case a metal such as aluminum must be used which, in the process of reaction, is converted into aluminum chloride, the alkyl chloro compounds of silicon being simultaneously produced. There are gradations in the ease with which the organic radical can be introduced into the silicon chloride, the tetrachloride being the most difficult, the methyl trichloro more readily and the dimethyl dichloro quite easily. On the other hand, the reduction of the tetrachloride by hydrogen is the easiest, while the hydrogenation of the dichloro dimethyl compound has not yet been successfully accomplished. This contrast in ease of methylation and hydrogenation is doubtless significant and points to a divergence of mechanism in the two cases.

POLYMERIZATION PROCESSES

Publication activity in these areas is increasing as wartime restrictions are increasingly removed. There was a steady stream of articles throughout the year dealing with various phases of this important area of present effort. Typical, for example, is the October issue of the *Journal of the American Chemical Society* which contains three important articles on this topic. Kolthoff and Dale discuss the mechanism of emulsion polymerization, which is the technique of government synthetic rubber production. Lewis, Mayo, and Hulse discuss the copolymerization of pairs of materials such as acrylonitrile, methyl methacrylate, styrene and vinylidene chloride. They use their data to confirm their previously formulated mechanism for the growth of the chains of molecules of which the polymers are composed. The results show clearly that the reactions of the free radicals, which are the growing units, are quite specific, both the ratio and the order of reactivity changing as the radical is changed. There is no simple relation between the relative tendencies of two monomers to enter a copolymer and their individual rates of polymerization with themselves. Walling and Briggs in the same issue of the *Journal* set up equations to apply to the composition of a copolymer from systems containing more than two monomers, and test their equations with data on copolymers containing three or four components drawn from the series mentioned above as studied by Lewis, Mayo, and Hulse. These researches demonstrate an increasingly deliberate scientific progress in this technically important area of effort.

PHYSICS

By Thomas H. Osgood
Professor, Michigan State College

GENERAL

The use of atomic bombs (see Atomic Bombs p. 127) to hasten the end of the war against Japan focussed the attention of the general public, as never before, upon Physics. It is important to point out, however, that the atomic bomb is, in itself, not a discovery, but rather an engineering development of earlier discoveries of physics. Every few years since 1895 some important discovery in atomic physics has been made, each one a triumph of the human intellect. It is the sum total of these discoveries, including that of uranium fission in 1939, which made possible the development of atomic bombs.

During years of war, the ceaseless demand for new weapons and new methods of defense against enemy weapons involves an increasingly thorough exploitation of previous scientific discoveries. Between 1941 and 1945 this process of developing scientific discoveries into devices of practical military utility took place on such a vast scale and at such a furious pace that, to paraphrase the words of the 1944 Nobel prizewinner, Professor Rabi, the inheritance of technology has been nearly spent, and further advances, whether for peaceful or warlike purposes, can come only from further advances in fundamental science.

In the United States, during the war years, research in physics, as distinct from development work, was at a low ebb. Whether or not this was the case in most other progressive countries is not generally known. Two items are known, however, which have a bearing on the matter: First, the number of young scientific workers in training between 1941 and 1945 in the United States was proportionately much smaller than in many other countries, partly owing to the inflexibility of the United States selective service regulations; second, individual reports of a recent goodwill visit of British scientists to the Soviet Union indicate that many of the fundamental problems of physics which, in 1945, are claiming the attention of scholars in the United States, in Britain, and in the Soviet Union, are the same, and that there is an eagerness among scientists of *all* nationalities to resume a free interchange of scientific information.

The shortage of physicists and of other high grade scientific personnel in the United States is acute. Because of the low salaries which they are able to offer in comparison with industry and government service, universities and colleges are likely to be the chief sufferers. This will make the shortage a double-edged danger by retarding the education and training of potential scientists at a time when they are in great demand and when their profession is achieving an economic status more in keeping with its importance than formerly. To encourage the return of scientists to the universities, several agencies are making funds available for research in universities by men who left their academic posts for urgent war assignments; and to take care of the further training of young scientists whose studies were interrupted, various scholarships and fellowships have been established.

THE NUCLEUS

In 1945, the most fundamental particles of physics were the proton and the neutron. Of the other sub-atomic particles, positive and negative electrons can be created from radiation; mesotrons, so frequently found in cosmic rays, have but a transient existence; alpha particles are a combination of protons and neutrons. True, a proton can switch to a neutron or a neutron to a proton during the decay of a nucleus, but this phenomenon in no way deprives them of their fundamental characteristics. From time to time since 1938 papers have been published postulating the existence of the neutretto, an uncharged particle of intermediate mass, or offering experimental evidence for the occurrence of the elusive uncharged neutrino. Evidence for a new neutral radiation, that is, for the occurrence of detectable neutral particles produced by a cyclotron is presented by Groetzinger, Kruger and Smith (*Physical Rev.* 67, 52). Near the target of the Illinois cyclotron they set up particle counters which could be shielded from the effects of previously recognized particles. In this way, the effects of slow and fast neutrons, and of gamma rays on the counters, were definitely excluded, but there still remained some radiation more penetrating than neutrons in water or gamma rays in lead. Bolstered by a report from Schein of the presence of mesotrons of low mass among cosmic rays, the three investigators attribute the observed residual particles to a neutral radiation which they suggest may consist of uncharged mesotrons of low mass, counterparts of the new charged mesotrons discovered by Schein.

After a wartime interlude of significant suppression, the subject of nuclear fission reappeared in *The Physical Review.* Lassen sent from Bohr's laboratory in Copenhagen (*Physical Rev.* 68, 142) the results of experiments designed to determine the net electric charges carried by the recoiling fragments resulting from the fission of uranium atoms. This measurement was achieved by spreading the charged, moving, nuclear fragments in the field of a cyclotron which itself produced the neutrons which accomplished the disintegration. It could have been guessed that the violence of the nuclear reaction would leave the fragments, immediately after fission, in a highly excited state, but the extent of this excitation was a matter of conjecture. Lassen's observations showed that the lighter group of particles carried net positive charges about 20 times, and the heavier group of particles about 22 times the electronic charge. This means that if krypton be taken as representative of the lighter group, the new krypton atom is, at the instant of measurement, stripped of 20 of its normal complement of 36 electrons; and if barium be considered typical of the heavier group, 22 of its 56 electrons are still missing. The results must be regarded as approximate only, for undoubtedly, as the fragments fly through some matter on their way to the recorder, frequent changes occur in their net charge. This statement can be made with some assurance, for Kapitza showed, as long ago as 1925, that even so simple an object as a flying alpha particle could change its charge as it ploughed its way through a gas.

Another advance in nuclear physics is the artificial manufacture by Seaborg of elements numbered 95 and 96 in the periodic table. These are of academic interest at the moment. Only microscopic quantities have been produced, but enough to discover some of their special properties, and to give proof that they existed before, though without being detected, in certain radioactive ores.

The cyclotron and the betatron, the two heavy magnetic machines for the production of high speed nuclei and electrons respectively, may soon be supplemented by another which combines some of the features of each. McMillan, its inventor, calls it the synchrotron because in certain respects its performance should be analogous to that of a synchronous motor. He outlined its operation as follows (*Physical Rev.* 68, 143). Because of the relativistic increase of mass with velocity, heavy particles being accelerated in a cyclotron will gradually fall out of phase with the high frequency accelerating field between the dees. This condition compels particles of definite energies, after they have circled many times, to stay in equilibrium orbits from which they can not be removed by the normal operation of the cyclotron. Given a set of particles thus circulating in an equilibrium orbit, all that is necessary in order to accelerate them further is to change the main magnetic field, or to vary continuously the frequency of the accelerating voltage between the dees. Because of the small mass of electrons, an accelerator for these particles could conveniently employ a changing magnetic field, while for heavier nuclear particles a frequency-changing device would be appropriate. Though the design of the synchrotron is still in the pencil-and-paper stage, McMillan stated that the instrument "offers the possibility of reaching energies in the billion volt range with either electrons or heavy particles." Its chief merit is that it will not be limited by the relativistic energy restrictions which prohibit the attainment of such high energies in the conventional cyclotron; rather, it uses these restrictions to proceed to still higher energies.

Turning now to matters which do not probe so far into the future, several papers were published dealing with the disintegration or excitation of nuclei by x-rays and by electrons, and with the decay processes of the products of the fission of uranium. Considerable attention has been given to nuclear isomers. Among artificially radioactive substances, it was found first in the case of bromine, in 1936, that two atoms of the same element, having the same characteristics with respect to mass and nuclear charge, could appear in different initial energy states, as evidenced by the different periods of radioactive products to which they gave rise. The study of such isomers and the cataloging of their decay periods is a necessary preliminary to an understanding of the energy levels of the nuclei and their inter-relations. A curious regularity, so far apparently unexplained, has been found in the grouping of elements which exhibit isomerism in consecutive threes, such as silver, cadmium, and indium; and platinum, gold, and mercury. Wiedenbeck (*Physical Rev.* 67, 92) states that it is probable that krypton, strontium, and rubidium will form another of these triads.

X-RAYS

The most commonly known uses of x-rays are in diagnostic and therapeutic medicine, and in the radiography of metals. During the years 1941-45, many developments were made in the application of x-rays in these fields. X-ray tubes can now produce such powerful radiation that it is possible to make x-radiographs in much the same way as "instantaneous" photographs are made with an ordinary camera. Here is a powerful tool for investigating the operation of mechanical devices in which high relative velocities are encountered, under actual working loads. For example, a centrifuge can be examined while rotating at high speed, and undesirable distortion of its parts can be detected.

In physics laboratories, however, much more basic problems remain to be solved. For example, when an electron of known energy impinges upon a known distribution of atoms of known atomic weight, what is the chance that an x-ray photon of specified wavelength will be generated, and in what direction will it travel? This is a fundamental question to which an answer can yet be given only in principle. Progress towards putting the subject on a numerical basis was reported in a paper by Kirkpatrick and Wiedmann. (*Physical Rev.* 67, 321). Their attack was from the theoretical side; they provide a series of graphs and tables which will be of great help to experimental workers who need to compare their observations with theoretical predictions. It is but one more step in the long journey to a full understanding of the extra-nuclear structure of the atom and of the changes it suffers when x-rays are emitted.

At a different level of practical application it is to be noted that the simple Cauchois spectrograph is coming into more general use. This is a curved-crystal spectrograph invented in 1932 by Mlle. Cauchois in France. It possesses a high radiation-gathering capacity, yet has very good resolution, is easy to construct and adjust, and is almost portable. Edwards, Pool, and Blake (*Physical Rev.* 67, 150) used it in the identification of artificially radioactive materials during their decay. While they decay, many such atoms emit characteristic x-rays. Absorption methods can only locate the parent element approximately in the periodic sequence. To be really useful, the detecting device must be able to distinguish between atoms which occupy adjacent places in the periodic table. Only spectrographic methods can succeed. Any spectrograph of the ordinary slit type fails by reason of inadequate intensity, for the radioactive samples are usually weak. Edwards, Pool, and Blake have found the Cauchois spectrograph effective in the region 0.2A to 2.3A, thus covering all the elements from vanadium upwards, either in the K or the L series. In particular, they identified the x-rays emitted during the decay of Cd, In, and Cu. Reference lines were easily put upon the film by short exposures direct from an appropriate x-ray tube.

The year's progress included further work by Lonsdale (*Nature,* 155, 572) on the estimation of the perfection of crystals, especially diamonds. The word perfection is here used to denote the lack of a mosaic structure, and has little if any bearing on the appearance or value of a gem. In 1935, Kossel and Voges (*Ann.d.Physik,* 23, 694) in Germany, discovered the divergent-beam method of x-ray crystallography, in which a highly divergent beam, from a focus near or in the crystal itself, creates a complicated network of sharp curved lines on a photographic plate placed nearby. It turns out that the sharpness of the lines thus obtained is dependent on the presence or absence of mosaic structure in the crystal. Lonsdale finds that it is even possible to detect comparatively large regions of mosaic structure in otherwise perfect crystals by the local blurring of the network lines on the photographs.

COSMIC RAYS

Millikan, Neher and Pickering (*Physical Rev.* 66, 295) report that they have only now had time to analyze observations made five years ago with electroscopes carried to high altitudes by balloons in various places in the United States and Canada. They interpret their results as a confirmation and extension of the theory of the origin of the primary rays proposed by them in 1942. According to this theory, cosmic rays are produced in interstellar space by the transformation of the masses of atoms sparsely distributed there into proton or electron pairs. Different atoms would, of course, give rise to particles of different energies. There are, according to astronomers, six fairly abundant kinds of atoms there, *viz.* hydrogen, helium, carbon, nitrogen, oxygen, and silicon. The rays due to hydrogen are too weak to reach the earth anywhere, through the protecting geomagnetic field. Consequently, the primary spectrum of cosmic ray particles should be discontinuous, and should consist of five bands with energies appropriate to the annihilation of the last five atoms of the six mentioned. The most recent report by Millikan, Neher and Pickering offered definite evidence for the helium annihilation rays which occur only north of magnetic latitude 54°. They also related the observed variation in the intensity of the rays at such a latitude to the fluctuations of the earth's magnetic field which cause the latitude of entry of these rays to vary a few degrees. Thus, at any particular station, close to 54° N magnetic latitude, irregular variations in cosmic ray intensity are to be expected.

The evidence thus far presented by these three authors is not, however, entirely conclusive. Kusaka (*Physical Rev.* 67, 50), for example, has made some calculations of the cosmic ray intensity to be expected at various latitudes, on the assumption of a continuous energy spectrum of the primary particles, the number of particles in any small energy range varying in general as the inverse cube of the energy. He then compared the results of his calculations with the experimental observations of Millikan *et al.*, and was led to the conclusion that the agreement between his theoretical calculations and their experimental results was within the experimental error of the observations. The implication of Kusaka's work is that the experimental observations of Millikan *et al.*, could be produced by a *continuous* energy distribution of the primary cosmic ray particles, and that the deduction of a discontinuous primary energy distribution is therefore only one possible interpretation.

The intensity of cosmic rays is not constant at any one location. There are sudden temporary spurts of energy which are interpreted as being caused by passing showers of particles. The theory of the production, frequency, energy, and lateral spread of a shower is related to the energy spectrum of the shower-producing agent. A recent series of experiments by Lewis (*Physical Rev.* 67, 228) involved the observation of bursts of ionization simultaneously in two large ionization chambers, whose horizontal separation at any one altitude could be varied. "The results of this experiment," states Lewis, "strongly indicate the presence of showers with very small extension of their high density region. Such showers probably originate far below the top of the atmosphere, which means that they must be started by high energy electrons or photons of secondary origin. A possible process which could produce electrons at great depths below the top of the atmosphere is the disintegration of a mesotron of very short mean life." The existence of such mesotrons was proposed in Møller and Rosenfeld's theory of nuclear forces. The experiments are significant in that they suggest the existence (admittedly transient) of a new type of particle. Other lines of evidence point in the same direction.

CREATION OF MATTER

The explosion of atomic bombs aroused considerable popular interest in the transformation of matter into energy, following Einstein's equation $E = mc^2$, developed in 1905 as a consequence of the special theory of relativity. One aspect of this transformation, the creation of positive and negative electron pairs from radiation, is a subject of frequent scientific study. In order that the laws of conservation of momentum and energy may be satisfied, this creation of pairs must take place in the field of some other particle, usually a nucleus. The formation of positive and negative pairs in the field of an electron has not been so commonly observed (for example in cloud chambers) although a few rather inconclusive examples of the process have been reported since 1938. In the course of a study of the gamma rays emitted during the decay of radioactive sodium to magnesium, Ogle and Kruger (*Physical Rev.* 67, 282) found two very satisfactory examples of pair production in the field of an electron. When such an event occurs, a triple track is formed, for the electron in whose field the transformation takes place must carry away some of the momentum of the primary photon in the same general direction as that of the created pair. The threshold gamma ray energy for the process, as first calculated by Perrin, is $4mc^2$, where m is the positron or electron mass and c is the velocity of light. This corresponds to 2,040,000 electron volts. Now the gamma rays from radioactive sodium have various energies, including a strong line at about 2.6 Mev. Hence the gamma rays have enough energy for the process, with about 0.6 Mev left over to give kinetic energy to the particles, which therefore make good tracks. Ogle and Kruger checked carefully the energies and the components of momentum of the two triplets found during their experiments and verify Perrin's calculation to an accuracy of a few per cent.

ORGANIC AND INORGANIC CHEMISTRY

By Chester Merle Suter
Director of Chemical Research, Winthrop Chemical Company

GENERAL

The low point in the quantity of chemical research publications in this country for the war period was reached during the latter part of 1944 and early 1945. After the end of the Japanese war (August), publication volume began a slight upturn. Description of some of the research work done during the war is finding its way into the various regular channels such as the *Journal of the American Chemical Society* and other periodicals. Other extensive research projects will be described in comprehensive monographs. For example, the work on the synthesis of penicillin, which was a collaborative project, and also the large amount of antimalarial research carried out under the auspices of the Office of Scientific Research and Development are expected to be put into monograph form during the next few years. This seems necessary because adequate reports on work in certain projects would make it impossible for journals to carry the publication load.

PROPOSED NATIONAL RESEARCH FOUNDATION

As a consequence of the report by Dr. Vannevar Bush, director of O.S.R.D., to the President on a "Program for Post-war Scientific Research" several bills have been introduced in the Senate dealing with the establishment of a National Research Foundation designed to lend government support to scientific research in various fields. The details of these bills have been the object of much discussion on the part of prominent scientists and others who are interested. The manner in which the Foundation is established is of importance, as it will determine the pattern for government support of fundamental research for many years. Any large scale Federal research program will greatly increase the already serious shortage of competent scientists. This shortage, rather than a deficiency of funds, either public or private, will limit the research carried out in chemical and other fields during the next decade. Perhaps the most immediately helpful activities of the proposed Foundation will then be the aid it gives to universities in the training of students and to scientific societies in the publication of the results of research.

VANADIUM TETRACHLORIDE

The interesting properties of vanadium tetrachloride have been emphasized by Simons and Powell (Pennsylvania State College). The formula, VCl_4, corresponds to a free radical structure which is supported by the intense red color of the compound. It is not salt-like in behavior, distilling at 152° under atmospheric pressure with some decomposition. By heating at 140° and sweeping out chlorine with dry carbon dioxide, conversion to vanadium trichloride is complete. In carbon tetrachloride solution at a low temperature freezing point, measurements indicate that the vanadium tetrachloride exists chiefly as the dimer, V_2Cl_8.

MANGANESE CARBIDE

Several of the carbides, *i.e.* compounds containing only a metal and carbon, have great commercial value. However, manganese carbide (Mn_3C) has received little attention since the pioneer work of Moisson in 1896 until 1945. Myers and Fishel (Vanderbilt University) report that the reaction of water with this compound gives considerably different results than originally indicated; 75 per cent of the gases evolved is hydrogen and the remainder mostly methane and ethane. When hydrochloric acid was substituted for water the hydrogen content rose to 95 per cent. In addition to the gaseous products, part of the carbon was converted into free carbon and liquid hydrocarbons when acid was present in the hydrolysis mixture. The hydrolysis products of carbides have long been of interest in connection with one theory of the origin of petroleum. Hydrocarbons are usually important among the hydrolysis products of carbides.

HYDROCARBON CHEMISTRY

New and interesting features of hydrocarbon chemistry continue to be described in the literature. Several surprising new reactions have been described by Kharasch and co-workers (University of Chicago). They find that α-olefins, such as 1-octane, react with carbon tetrachloride or chloroform in the presence of a peroxide, such as acetyl peroxide, by addition of the halogen compound to the olefin bond. For example, chloroform with 1-octane yields 1,1,1-trichlorononane, a compound which would be very difficult to prepare by hitherto known methods. In other reactions, methyl dichloroacetate was found to condense with an α-olefin to yield a corresponding methyl alkyldichloroacetate. Furthermore, trichloroacetyl chloride reacts with an α-olefin to yield an α,α-dichloro-β-chloroacyl chloride, a type of compound formerly unknown. Experimental details of this reaction have not yet been published.

In an extension of peroxide-catalyzed reactions, it was found that olefins react with phosphorus trichloride to give chloroalkylphosphorus dichloride in good yields. There has not been available previously any method for preparing these compounds.

Schmerling (Universal Oil Products) continued his interesting work on paraffin hydrocarbon reactions. He reports that, in the condensation of allyl chloride with isobutane in the presence of aluminum chloride as catalyst, it is possible to obtain from 35-40 per cent yield of a compound, 3,4-dimethyl-1-chloropentane, and with this is formed a dichloro compound, 4,4-dimethyl-1,2-dichloropentane. This is a new type of reaction for saturated hydrocarbons. Schmerling also discusses the mechanism of the alkylation of paraffins in which unexpected reactions occur. It is known, for example, that the reaction of ethylene with isobutane yields chiefly 2,3-dimethylbutane as well as minor products. Schmerling postulates that the first step in the reaction is the addition of hydrogen chloride to a mixture of isobutane and ethylene, resulting in the formation of t-butyl chloride and ethane. The t-butyl chloride then reacts with another molecule of ethylene to form an additional product, $(CH_3)_3CCH_2CH_2Cl$. This, in turn, reacts with a molecule of isobutane to yield the principal product, 2,3-dimethylbutane, and another molecule of t-butyl chloride which then again enters into reaction with ethylene repeating the process. The evidence indicating the usefulness and applicability of this mechanism is cited in the original article.

It has also been reported by Schmerling that it is possible to condense alkyl chlorides with olefins in the presence of a catalyst such as aluminum, iron, or bismuth chloride to give a saturated halide in considerable yield. For example, t-butyl chloride reacts with ethylene in the presence of aluminum chloride at a low temperature to produce 1-chloro-3,3-dimethylbutane. Secondary and primary chlorides react less readily.

It has been found by McKinley, Stevens, and Baldwin that a 20 per cent yield of a new isobutylene dimer may be obtained by heating isobutylene at 400° at high pressure. The compound is 1,3,3-trimethylcyclopentane. It is not formed from diisobutylene, and hence this olefin is not an intermediate in the reaction.

The condensation of methylcyclopentane with olefins in the presence of sulfuric acid or of hydrogen fluoride has been investigated by Pines and Ipatieff. They report, for example, that, with the butenes, methylcyclopentane undergoes ring enlargement with formation of alkylcyclohexanes. This is a consequence of a complex reaction which can not be adequately discussed here.

THIOPHENE

Thiophene was originally detected because it gave a color reaction as an impurity in benzene which pure benzene did not give. Only in 1945 was thiophene itself available in large quantities. This was owing to a new process worked out in the laboratories of certain oil companies. Interestingly enough, now that large quantities of thiophene are available, it develops that its physical properties are not exactly those which it was formerly credited with having. Fawcett and Rasmussen of the Socony Vacuum Laboratories have undertaken a careful investigation of these physical properties and now report on their work. Thiophene boils at 84.12° and has a freezing point of —38.30°C. Just as in the early work on the isolation of benzene from coal tar, it was difficult to obtain benzene free from thiophene; in the present work it was not easy to isolate thiophene entirely free from benzene, it being the last impurity to be removed from the final product.

SYNTHETIC POLYMERS

One of the consequences of the war effort was to make available at a low cost compounds hitherto obtainable not at all or at a relatively high price. The use of styrene in manufacturing synthetic rubbers on a huge scale has made this compound a heavy chemical item with an average sales price of 12¢ per pound during 1944. Hence the possibility of utilizing this compound in various syntheses is under study in a number of laboratories. Emerson (Monsanto Chemical Company) has reported on the reaction of styrene oxide with various reagents. The reaction of ammonia and primary or secondary amines yields β-hydroxy-β phenethylamine or its N-alkyl compounds which are of possible use as medicinal agents and in other ways. Alcohols react in a similar manner to yield β-hydroxy-β-phenylethyl alkyl ethers, and organic acids are converted into styrene glycol diesters Styrene chlorohydrin is dehydrated by an acid catalyst to β-chlorostyrene whereas a neutral catalyst and steam convert it into phenylacetaldehyde, a compound of interest in the perfume industry. The intermediate styrene glycol can be converted to β-phenylnaphthalene by known methods. A basic catalyst, such as alumina, converts the chlorohydrin into acetophenone.

Acrylonitrile, a necessary raw material in one variety of synthetic rubber, has been studied further by Bruson and co-workers (Rohm and Haas Company). In the presence of a strong base, chloroform and bromoform condense with acrylonitrile to form the corresponding trihalogenated butyronitriles. These can in turn be converted to amides and acids.

The combination of benzene and ethylene to make ethylbenzene is of interest because the ethylbenzene can then be converted into styrene, an ingredient of synthetic rubber. Mattox has described the use of solid phosphoric acid catalysts which yield as much as 250 lbs. of ethylbenzene per pound of catalyst without reactivation. One may expect that the extensive research on the benzene-ethylene reaction also will be described in further publications from the laboratories during the next few years.

The urgent need for enormous quantities of butadiene for synthetic rubber manufacture led to a study of the various feasible methods for making this compound. In as much as a fermentation process makes available 2,3-butylene glycol on a large scale, it seemed of interest to study the dehydration of this to butadiene. The German synthesis of butadiene used in making their "buna" rubber started with 1,3-butylene glycol derived from acetylene as the raw material. A series of papers originating in the Peoria Regional Laboratory of the Department of Agriculture appeared during 1945, describing the conversion of 2,3-butylene glycol into the diacetate and the thermal decomposition of the latter to butadiene. Operations were finally carried out on a pilot plant scale. Under certain circumstances the process might become commercially important, but butadiene has been obtained chiefly from ethyl alcohol or oil during the past few years.

Reports are now beginning to appear in the journals on the scientific investigations which were directly related to the synthetic rubber program. For example, Kolthoff and Dale (University of Minnesota) have published a report on the mechanism of emulsion polymerization dealing with the polymerization of styrene under the influence of persulfate. The rate of the polymerization remains unaffected in the presence of a transfer agent such as a mercaptan. Price and C. E. Adams of the University of Illinois have also studied the kinetics of the polymerization of styrene. They found that the polymerization in a soap emulsion was completely inhibited by air. Under nitrogen the rate of the reaction was dependent upon the square root of the concentration of a persulfate catalyst. In the presence of a mercaptan, such as the dodecyl compound, the polymerization stopped at a much earlier stage, the molecular weight of the polymer formed being smaller.

A considerable study has been made by Lewis, Mayo, and Hulse of the United States Rubber Company laboratories on the co-polymerization of acrylonitrile, methyl methacrylate, styrene and vinylidine chloride taking two compounds at a time. They concluded that the interaction of the free radical intermediates with double bonds is specific, that is, that both the ratio and the order of reactivities of a monomer series change as the radical is changed and that there is no simple relation between the relative tendencies of two monomers to enter a co-polymer and their rates of polymerization alone. It is evident that, because of the considerable number of compounds which can be polymerized, the study of co-polymers will continue to be an extensive field of scientific investigation.

The recently developed silicon polymers were in part the result of a long series of investigations on the so-called silanes. There are appearing in the journals now scientific reports on the fundamental chemistry of this series. Krieble and Elliott (General Electric Company) have reported on the preparation and properties of the chloromethylchlorosilanes. Articles on vinyl and allyl chlorosilane by Hurd have appeared from the same research laboratories.

Another important contribution to silicon chemistry was made by Rochow (General Electric Company) who found it possible to synthesize alkyl and aryl silicon halides by the high temperature (360°C) reaction between silicon and the organic halide. A metal catalyst is frequently of value in carrying out the reaction. Hitherto, organic silicon halides have been available only through the expensive process of treating a silicon halide, such as silicon tetrachloride, with a Grignard reagent or other organometallic compound. The yield in the new method at times reaches 70 per cent of dialkyl- or diaryl-dihalosilane.

DDT

The exceptional importance of the new insecticide familiarly known as DDT [which refers to 1,1-di (4-chlorophenyl)-2,2,2-trichloroethane] has resulted in an extensive chemical investigation of its preparation and properties. Haller and co-workers, in a recent report on joint work done under O.S.R.D. sponsorship, have indicated that in the commercial product there is a total of at least 14 compounds; that many were isolated from a sample of commercial material. None of these turned out to be as active an insecticide as DDT itself. The pure compound has a melting point of 108-109°. The major impurity in the commercial product is a compound containing one chlorine in a benzene ring in the ortho instead of the para position. The commercial grade material contains 70 per cent of the major component, that is, the compound for which the product is named. The insecticide became available to the general public in the latter half of 1945.

β-LACTOGLOBULIN

Recently there appeared a very comprehensive report on the properties of the protein, β-lactoglobulin, based on studies by Brand, Saidel, Goldwater, Kassel, and Ryan of Columbia University. The investigation extended to the point where it was possible to postulate a formula for the compound; it has a molecular weight of 42,000 and the empirical formula $C_{1864}H_{3012}N_{468}O_{576}S_{21}$. Nineteen different amino acids are present in this protein molecule. One molecule of the protein contains four tryptophane residues, four of cysteine, seven of arginine, nine of tyrosine, 15 of proline, 21 of threonine, etc. Although it is recognized that there is some uncertainty in these numbers and some uncertainty in the molecular formula, this protein has been as carefully studied and its composition as carefully determined as probably any compound in this group of complex molecules. There is, however, nothing in the work which would indicate the order in which the amino acid linkages occur in the protein chain. The work is particularly significant in connection with nutrition studies, for results based upon the use of this protein may now be clearly related to the use of synthetic amino acids.

CARBOHYDRATE CHEMISTRY

It has been found by Hurd and Bonner (Northwestern University) that tetra-acetyl-α-D-glucosyl chloride reacts with benzene in the presence of aluminum chloride to give several products. Aside from the formation of acetophenone, the principal product isolated after acetylation of the reaction mixture was a tetra-acetyl glucosylbenzene, a type of compound hitherto unknown. 1,1-Diphenylglucitol, a compound containing two benzene nuclei, was also formed. This new reaction opens many possibilities for the preparation of sugar derivatives containing an aromatic linkage or group. Similar reactions occur with toluene and naphthalene.

In an extension of the condensation of sugar derivatives with benzene, it was found also that sugar acetates, such as glucose pentaacetate, condense with benzene to yield the corresponding glucopyranosylbenzene. The optimum conditions for the reaction require ten moles of catalyst per mole of sugar. In as much as the carbohydrate acetates are more readily available than the corresponding acetylglycosyl chlorides, it is possible that this reaction will be more important than the other. The reaction always led to the formation of a certain amount of 1,1-diphenyl-1-desoxy-d-glucitol in addition to the compound containing only one benzene ring. The structures of these arylcarbohydrates were confirmed by another interesting new synthesis involving the Grignard reagent and tetraacetylglucosyl chloride. Previous workers have failed to secure the desired products in carrying out this reaction because insufficient Grignard reagent was employed to react with all the acetyl groups and the halogen.

Wolfrom and co-workers (Ohio State University) have devised a new method for separating carbohydrate acetates using a chromatographic procedure. An examination of the constituents of cane juice and of blackstrap molasses has shown, after the sugar was removed by fermentation, that one of the principal components is inositol. Along with this there was isolated a small amount of D-mannitol from the cane molasses, but this was not found in normal cane juice. D-glucose was also isolated from cane molasses.

The new chromatographic method developed by Wolfrom for separation of sugars promises to be of general application. An example of the adsorbent used is a Florida clay sold under the name of Florex XXX. It is possible to separate a mixture containing equal amounts of sorbitol and D-glucose almost completely, recovering almost 100 per cent of the added sugar; 99.7 per cent of the sorbitol and 2 per cent D-mannitol were separated so that two zones were shown. This procedure will be an excellent aid in the separation of sugars, which has proved one of the most difficult types of laboratory operations. As a further application of the method, it was shown that lemon juice could be chromatographed until the ascorbic acid content concentrated into a narrow zone.

THIOURACIL DERIVATIVES

One of the most interesting recent developments in synthetic organic medicinals is the discovery that certain types of compounds are effective in reducing thyroid activity and can be used in treatment of patients whose thyroid gland is over active. These compounds are useful either in preparation for the usual operational treatment or as a substitute therefor.

The most effective compounds are thiouracil and 6-methylthiouracil. There has appeared a paper by Anderson, Halverstadt, Miller, and Roblin (American Cyanamid Company) indicating that the n-propyl, i-propyl, and benzylthiouracils are approximately ten times as active as thiouracil itself, and from preliminary clinical trial the n-propyl compound is apparently better than the less active drugs from the standpoint of freedom from side reactions. Further interesting developments in this field may be expected.

PINEAPPLE OIL

The composition of the volatile oil of pineapple has been studied by Haagen-Smit, Kirchner, Deasy and Prater of the California Institute of Technology. They have found that the volatile oil content of the summer fruit is much greater than that of the fruit collected in the winter. The chief components in the oil are ethyl acetate and ethyl alcohol, and then, in smaller amounts, acetaldehyde, ethyl isovalerate, ethyl acrylate, and ethyl n-caproate. In addition to these relatively low-boiling fractions, a high-boiling fraction contains sulfur. The small percentage of this sulfur-containing compound is indicated by the fact that only 0.25 g of sulfur was found in about 1,000 kilograms of the winter fruit pulp. It was shown by synthesis that the sulfur compound was an ester, methyl β-methylthiolpropionate. This is, of course, closely related to cysteine, and it is possible that it is obtained in the plant from this amino acid by loss of an amino group followed by methylation.

CHEMISTRY OF PENICILLIN

Late in 1945, there appeared simultaneously in *Nature* and in *Science* a brief summary of the extensive work on the chemistry of penicillin which has been carried out in secret during the war period. In Great Britain some 16 laboratories and university departments worked on the chemistry of penicillin, and in the United States a total of 22 laboratories participated in the research program. Details of the results obtained must await publication of a monograph sometime later, but a brief outline can be given here.

It was found that several antibiotics of the penicillin class could be isolated from various mold metabolic solutions. These all have the empirical formula, $C_9H_{11}N_2O_4S \cdot R$. The compound known in this country as penicillin F and in Great Britain as penicillin I has as its value for R, the group Δ^2-pentenyl, $-CH_2CH = CHCH_2CH_3$. Most commercial penicillin consists chiefly of penicillin G which is known in Great Britain as penicillin II; here R is benzyl. In the commercial production of penicillin a certain amount of penicillin X has also been isolated; for this, R is *p*-hydroxybenzyl.

The penicillins are rather strong mono-basic acids. Electrometric titration does not show the presence of a basic group although this does appear in acetic acid solutions. Hydrolysis of the penicillins with dilute mineral acids leads to the liberation of one molecule of carbon dioxide, an amino acid which has been named penicillamine, and various other products. Penicillamine turns out to be the dextro β,β-dimethylcysteine, a compound which was not previously known. Further hydrolysis of penicillin G yields phenaceturic acid, phenylacetamide, and an aldehyde, $C_{10}H_{11}NO_2$.

Penicillin reacts readily with water, methanol and amines, particularly benzylamine. The reaction products, which are inactive against bacteria, are all penicilloic acid derivatives, and penicilloic acid appears to be a thiazolidine. One reaction of particular interest in determining the possible structure of penicillin is its behavior toward Raney nickel in aqueous solution. This reagent removes sulfur to give desthio-penicillin together with phenacetyl-alanyl-valine. The alanine residue in this derivative has the natural *l*- configuration and valine has the *d*- configuration. Various ideas regarding the structure of penicillin have been advanced, but these can not be discussed in detail, and full information is not available concerning them until the comprehensive monograph which has been promised appears. Suffice it to say that complete agreement on the structure has not yet been achieved, and no synthesis of penicillin or an analog has been reported.

STREPTOMYCIN

Intensive scientific activity in the field of antibiotics has led to the discovery by Waksman of a new compound of great promise which is known as streptomycin. Recently a group of investigators in the Merck Laboratories has been able to isolate the compound in a pure state as a crystalline double salt of calcium chloride having the formula $(C_{21}H_{37}N_7O_{12} \cdot 3HCl)_2 . CaCl_2$ which indicates that streptomycin itself is $C_{21}H_{37}N_7O_{12}$. The high nitrogen and oxygen content are noteworthy features of the formula.

SYNTHESIS OF QUININE AND QUINIDINE

Although the synthesis of quinine was announced in 1944 (THE AMERICAN YEAR BOOK), full details of the work were not made available until 1945. In as much as *d*-quinotoxine, a compound which can be derived from quinine, had earlier been reconverted into quinine by Rabe, the synthetic work of Woodward and Doering had the synthesis of *d*-quinotoxine as its aim. In later work by Woodward, Wendler and Brutschy (Harvard University), a procedure for the quantitative oxidation of quinine to quininone was developed; upon reduction quininone was converted into a mixture of quinidine and quinine in which the former predominates. This two-step conversion of quinine to quinidine was of considerable importance because quinidine, one of the minor cinchona alkaloids which accompanies quinine, became very scarce during the war. Quinidine is considerably more effective than the other cinchona alkaloids in the treatment of auricular fibrillation and hence has a relatively small but important usefulness in medical practice. In as much as quininone can be prepared from *d*-quinotoxine, this later work completes the total synthesis of quinidine. It seems probable that other cinchona alkaloids could be made by the methods employed for quinine and quinidine.

COLOR AND CONSTITUTION OF DYES

Colored organic compounds, particularly dyestuffs, have a variety of uses other than imparting hues to textiles. Brooker and co-workers (Kodak Research Laboratories) have published several new contributions in their series on the study of dyes of value in photography. Of particular interest is the correlation of molecular structure and color for an extensive series of dyes containing some 25 different heterocyclic nuclei. Variation in the absorption band is closely related to the basicity of the heterocyclic nucleus. Many carbocyanine and pyrrolocyanine dyes were described for the first time. Pyrrole nuclei have hitherto not been utilized in this type of dye.

ELECTROCHEMISTRY

By Colin G. Fink
Professor, Columbia University

ELECTROTHERMICS

J. W. Gartland of the National Carbon Company reported on a new high temperature carbon tube furnace. The tube attains a temperature of 3000°C and it can be held at this high temperature within ±20°C. The capacity of the furnace is about one pound. Except in the electric arc, temperatures of 3000° are usually difficult to obtain. There are only three substances with melting points above 3000°C.

At Sault Ste Marie a large calcium plant was built during the war. The metal is produced by the electrolysis of fused calcium chloride. It is a very efficient scavenger for both ferrous and non-ferrous metals.

Fink and Wroughton investigated the synthesis of cyanogen and of hydrocyanic acid at elevated temperatures. Upon passing hydrogen and nitrogen over heated carbon (2000°C), hydrocyanic acid is formed in a single step and at ordinary pressures. This direct synthesis would seem to have considerable advantage in simplicity of process alone. The rate of formation of hydrocyanic acid is directly proportional to the nitrogen concentration and inversely proportional to the square root of the hydrogen concentration.

A paper of special interest was presented by D. B. Alnutt and Chas. L. Sheer of the Foote Mineral Company. It covered the manufacture, fabrication, and properties of zirconium metal. The pure metal is silver-white, very ductile, and highly resistant to corrosion. It has found numerous uses such as spinnerets for rayon; vacuum tube elements, notably grids, to prevent the emission of secondary electrons through the grids; etc. Zirconium metal powder is a very efficient reducing agent in the preparation of metallic caesium for the "electric eye" or photo tube. The powder is also used in ammunition primers and in smokeless flashlight mixtures.

High frequency induction heating has found ever wider application in industry. An outstanding accomplishment is the fixation of atmospheric nitrogen at efficiencies far in excess of all previously recorded figures.

The setting of plastic adhesives in the manufacture of plywood by high frequency heat has an important bearing on the development of wooden air craft. It appears certain that wooden air-plane parts will compete with corresponding parts made of magnesium or aluminum. Magnesium is addicted to stress corrosion and aluminum to fatigue under constant vibration caused by the air-plane engines.

Dielectric heating is not applicable to materials with resistivities less than 1000 ohm-cm. When power above 20 kilowatts is involved, frequencies above 20 megacycles are impractical.

ELECTROPLATING

The electrodeposition of indium on lead and the consequent production of lead-indium diffusion alloys, highly resistant to corrosion by lubrication oil, was carried out on a very extensive scale during the war. William S. Murray advocated the use of the sulfamate indium bath in preference to the sulfate bath most generally used.

The indium-tin alloys were investigated at Columbia and the complete fusion diagram submitted.

T. G. Coyle reported at length on electroplated chromium containing oil retaining surface pores. Such porous chromium deposits were extensively used during the year on steel rolls, piston rings, diesel engine cylinder liners, and aircraft cylinders.

Millions of machine parts were chromium plated to resist wear.

Renewed interest throughout the country was displayed in the electrolytic application of metal surfaces to plastic articles. The finished articles compete seriously with plated brass and plated diecast articles. An outstanding feature of the electroplated plastic articles is their lightness.

The year brought forth numerous reports on anodizing and on electrolytic polishing. Chromic acid continues to be one of the best reagents for treating the surfaces of aluminum, magnesium, and stainless steel in order to retard corrosion.

ZINC

Details of the electrolytic production of pure zinc by electrowinning at Corpus Christi, Tex., were published by George H. Cunningham and Allen C. Jephson. Owing to the relative scarcity of copper, die cast metal has been substituted for brass. In order to produce die castings efficiently pure zinc is necessary. About one third of the zinc metal produced today is electrolytic.

ELECTRONICS

Howard M. Elsey of the Westinghouse Corporation solved the problem of the short life of commutator brushes at high altitudes (air planes). He found that treating the carbon brushes with lead iodide developed a characteristic dark, satiny film that resulted in a normal life of the brushes.

Samuel Ruben developed a new rectifier for alternating current in which the electrically active surfaces are magnesium sulfide and cuprous sulfide. During electro-forming magnesium, metal disc surfaces develop a film of magnesium sulfide and the adjacent cupric sulfide is reduced to cuprous sulfide. The operation of the rectifier is purely electronic.

ELECTROPHORESIS

Morris Feinleib of the author's laboratory reported on the ease with which vinyl plastics can be deposited on metal surfaces. The films are remarkably clear, tough, and free from pinholes. The films have good insulating properties and protect metals, covered with these films, against corrosion.

DIVISION XXII

BIOLOGY

ORGANIC EVOLUTION AND GENETICS

By Myron Gordon
Research Associate in Genetics, New York Zoological Society

TEMPO AND MODE IN EVOLUTION

Several years ago the National Research Council, in the Division of Geology and Geography in cooperation with the Division of Biology and Agriculture, formed a new committee for the purpose of discussing "The Common Problems of Genetics, Paleontology, and Systematics." The chairman of that committee was Dr. George Gaylord Simpson, Curator of Fossil Mammals at the American Museum of Natural History. Late in 1944 Dr. Simpson's book *Tempo and Mode in Evolution* was published by the Columbia University Press. Here may be found the answers to those who wondered what there was in common, particularly between paleontology and genetics, to warrant the formation of a bipartisan committee and what would geneticists and paleontologists discuss at their joint meetings. None was more aware of the difficulties of reconciling the views of these branches of biology than Dr. Simpson. He put it this way in his introduction:

"Earlier work in genetics was devoted mainly to studying the transmission of inherited characters, cryptogenetics. Earlier work in paleontology was devoted largely to the determination of the forms and sequence of fossil animals and to their classification. There is hardly any point of contact between these subjects, and it is not surprising that workers in the two fields viewed each other with distrust and sometimes with the scorn of ignorance. Now this basic work in both subjects, although far from completed in either, is so well advanced that what remains must in great part follow charted paths. Both geneticists and paleontologists are turning to new fields. In genetics the vigorous and trail blazing work is now more likely to be in the field of phenogenetics—not how heredity occurs, but how hereditary characters achieve their material expression in the life cycle of an animal or plant and in the third major division of modern genetics, that of population genetics.

"Like the geneticist, the paleontologist is learning to think in terms of populations rather than of individuals and is beginning to work on the meaning of changes in populations. Thus, from very different starting points, geneticists and paleontologists have come to the study of problems that are not only related but also sometimes identical."

Dr. Simpson analyzes his material under two headings: *tempo* which has to do with evolutionary rates under natural conditions, the measurement and interpretation of rates, their acceleration and deceleration, the conditions of exceptionally slow or rapid evolutions, and phenomena suggestive of inertia and momentum; and *mode* which deals with the way populations became genetically and morphologically differentiated, to see how they passed from one way of living to another or failed to do so, to examine the figurative outline of the stream of life and the circumstances surrounding each characteristic element in that pattern.

In his discussion of the Organism and Environment, Dr. Simpson takes up the nature of adaptation, real and prospective functions in which the realization of functions by overlap of prospective functions of organism and environment are illustrated by informative diagrams, preadaptation and postadaptation, adaptive zones, and the application of so called adaptive grid. The book ends with a chapter on the specific modes of evolution which Dr. Simpson classifies as "speciation" at the lowermost level, "phyletic evolution which involves the sustained, directional shift of average characters of populations," and "quantum evolution." The last term is meant to apply to the relatively rapid shift of a biotic population in disequilibrium to an equilibrium distinctly unlike an ancestral condition. Such a sequence can occur on a relatively small scale in any sort of population and in any part of the complex evolutionary process. It may be involved in either speciation or phyletic evolution, and it has been mentioned that certain patterns within those modes intergrade with quantum evolution.

SEXUAL ISOLATION IN EVOLUTION

"If mature and sexually active females and males of two or more animal species inhabit the same portion of space they do not mate at random. For various reasons females of each species mate with and are inseminated by males of their own species more often than by males of other species. Causes which make mating and insemination selective rather than random may be grouped under the categories of sexual and mechanical isolation. Sexual or psychological isolation includes various differences in behavior, in smells, and in adornments which make females and males of different species less likely to find each other, and, if found, less attractive and therefore less willing to accept the courtship and invitation to mating. Mechanical isolation refers to differences in the structure or function of the genitalia and other body parts which play a role in the act of copulation and which handicap normal intromission and sperm delivery. The distinction between sexual and mechanical isolation is to a certain extent arbitrary, and it is probable that, with more study, situations will be found which will be intermediate or will require a different classification".

With this introduction Dr. Th. Dobzhansky of Columbia University with a number of coworkers, Dr. Ernst Mayr of the American Museum of Natural History, and George Streisinger of the Biological Laboratory at Cold Spring Harbor, Long Island, New York, began a series of experiments designed to understand a hitherto poorly understood factor in evolutionary problems. In a series of four papers under the common title: "Experiments on Sexual Isolation" which were published in the *Proceedings* of the National Academy of Sciences (30:238-244, 1944; 30:340-345, 1944; 30:335-339, 1944; 31:75-82, 1945), these authors found that in some species widely separated strains of the same species, some show selective and others show random choices. When northern (Mexican *Drosophila prosaltans*) males are kept with a mixture of northern and southern (Brazilian) females, more of the former than of the latter are inseminated. In a similar experiment the southern males also inseminate more northern than southern females.

A further indication of the trend in the genetic approach to the problems in evolution has been stated by Dr. J. T. Patterson of the University of Texas and Th. Dobzhansky (*Genetics* 30:429-438, 1945) in their introduction to the paper entitled "Incipient Reproductive Isolation between Two Subspecies of Drosophila pallidipennis." The process of transformation of races into species is in general slow. The only approach to its study is through examination of its successive stages represented on our time level in different species and species groups. Nor is the process uniform in all organisms. Even though the essential feature of speciation in sexual cross-fertilizing forms is the development of reproductive isolation between the diverging races, the isolation is attained by different means in different cases. This necessitates careful study of diverse groups of organisms, as well as of different related species with contrasting biologies, modes of life, and distributional relationships. From their special study they found that, while there exists a slight morphological difference between the two subspecies in question and that details of gene arrangement are almost identical and there is a lack of sexual isolation, nevertheless there is hybrid sterility. This suggests to them that the different components of the process of speciation characteristic for the genus Drosophila are largely independent.

GENETICS AND CANCER

In a book issued by the American Cancer Society, edited by Clarence C. Little, Sc.D., the facts on cancer are presented in a form to be read and understood by the average person. The book is divided into three sections—Research, Service, and Education. In the section on Research, Dr. Little explains the part that heredity plays in determining the incidence of cancer. Although his examples are taken from work on inbred mice, his conclusions will interest not only the research worker who is concerned in investigating the origin and nature of cancer, but also the layman who is primarily concerned with his or her individual well-being and health. Dr. Little first presents the basic factors in heredity and transmission, explaining Mendel's experiments, the problem of incomplete dominance, the role of chromosomes and heredity, sex linkage, and finally "Heredity and Cancer in Man."

According to Dr. Little, "The first definite fact is that cancer is not a simple, single entity from a biological or hereditary point of view. There is no great general hereditary tendency that protects against it." He reports that man is unlikely to be subject to the close imbreeding to which cancerous strains of mice are restricted. "This means," Dr. Little continues, "that for the present at least and until further knowledge is obtained the individual whose parents died of cancer or in whose family the disease is frequent, should be on the alert, cautious and intelligent in detecting and reporting any sign or symptom of cancer in his body. . . . Nothing is more cruel than the haunting fear that members of a 'cancer family' are allowed to experience. Future experimentation may show this fear is justifiable, but present knowledge does *not.*"

Dr. Little suggests more fundamental research of cancer in animals. Without exact knowledge of the biological nature of the material being used we shall not be able to evaluate the relative importance of heredity and other factors in the production of cancer. *Cancer, A Study for Layman* is published by the American Cancer Society.

GENETICS FOR THE PHYSICIAN

Dr. Julius Bauer, professor of Clinical Medicine in the College of Medical Evangelists, Los Angeles and formerly professor of Medicine in the University of Vienna, has prepared the second edition of his book *Constitution and Disease—Applied Constitutional Pathology* which was published by Grune and Stratton in 1945.

Dr. Bauer has felt that up to now too little attention has been given to the constitutional or genetic standpoint in both general and specialized practice of medicine, particularly in clinical endocrinology. He claims that certain clinical syndromes have been reported and interpreted on the basis of endocrinological considerations only. To discount or neglect the constitutional aspects of such syndromes may lead the diagnostician or the research worker astray from basic paths with respect to both etiologic discrimination and therapeutic effectiveness.

The book was written by a medical doctor for the doctor practicing medicine. It contains a storehouse of information that the geneticist will need and ought to know if his science is to have its practical application to human welfare. It however, is not a book aimed for reading by the layman.

In the introductory chapter Dr. Bauer describes the science and the art of medicine, the limits of normality, and the general principles of Mendelian inheritance. He defines "constitution" as the sum total of an individual's characteristics as they are potentially determined at the moment of fertilization. Cattell is credited with the statement: "Heredity determines what one can do, environment determines what one does do." Dr. Bauer discusses the complexity of the hereditary-environmental problems, so exceedingly important in human biology because of the sociological factors which are superimposed upon them. His viewpoint on the way genes work is in keeping with modern genetic thinking. For instance, he points out that different genes may produce the same end result while other genes may produce a series of what may appear to be totally unrelated effects. He discusses a large number of organs and shows their constitutional backgrounds. He stresses what he calls the "Integrative Systems of Individual Constitution," the endocrine system which is the mediator between constitution and the effector system.

He treats the problem of classification of normal and abnormal constitutions, and then discusses some of the major diseases with chiefly constitutional etiology. Included in the latter category are metabolic diseases, hypertension, hemopoietic types, peptic ulcers, cancer. For cancer he cites many instances of family histories where not only the kind but the site of the disease has been traced in a number of generations. Dr. Bauer ends his valuable book with a discussion of the principles of treatment, nonspecific therapy, pitfalls and errors. The bibliography contains over 400 references many of them of recent authors, but the important suggestions of Dr. Th. Dobzhansky should be added.

Dr. L. C. Dunn and S. Gluecksohn-Schoenheimer of Columbia University writing in the *Proceedings* of the National Academy of Science (31:82-84, 1945) under the title of "Dominance Modification and Physiological Effects of Genes" stated that in order to derive some meaning from such observations for R. A. Fisher's general theory of the origin of dominance in evolution, it would be necessary to specify whether modifiers of Sd (absence or shortening of the tail, absence or abnormality of one or both kidneys, absence of external anus and genital aperture and abnormalities of other parts of the urogenital system) would be selected because of their effect on tail length or because of their effect on urogenital development. In view of the evident relation between the urogenital expression and viability, there can be little doubt that modifiers which tend to make the urogenital effect of Sd recessive would be selected, but these same genetic constitutions may increase the dominance of Sd in respect to tail length. It can be concluded, they say, that the evolutionary significance of factors affecting dominance can be properly assessed only when their physiological effects are known.

Dr. M. M. Rhoades writing in the same journal (*P.N.A.S.* 31:91-95, 1945) under the title of "On the Genetic Control of Mutability in Maize" pointed out that the gene Dt in maize is of more than usual interest because of its striking ability to increase the mutability of the recessive allele which is normally highly stable. Dr. Rhoades indicated that the gene Dt is located at the end of the short arm of chromosome 9. The regional distribution of crossing-over in the short arm of this chrômosome and the location of the known mutant genes in chromosome 9 were evaluated, and by an examination of the published data on the genetic control of the mutation rate of the recessive allele, Dr. Rhoades concluded that the phenomenon could not be accounted for in terms of factor interaction, epistasis, or threshold values which Dr. Richard Goldschmidt of the University of California had suggested.

CYTOPLASMIC INHERITANCE

Experiments to test the probability of cytoplasmic inheritance have been carried out by three workers of the Washington University School of Medicine and Washington University: S. Spiegelman, Carl C. Lindegren and Gertrude Lindegren. They reported their work in the *Proceedings* of the National Academy of Sciences (31: 95-102, 1945), pointing out first that the production of galactozymase by *Saccharomyes cerevisiae* revealed that in certain diploid strains its appearance in the cell was effected by a direct interaction between the cytoplasm and galactose. It was also possible to adapt the normally diploid *Schizosaccharomyces pombe* which had previously been reported as unadaptable to galactose fermentation by inoculating a galactose medium with a heavy suspension of haploid spores.

The experiments with adaptation to both galactose and melibiose led to the conclusion that the gene initiates the synthesis of the adaptive enzyme providing the specific substrate is present. This is a definite reaction between the cytoplasm and the substrate.

In new experiments reported under the title of "Maintenance and Increase of a Genetic Character by a Substrate-Cytoplasmic Interaction in the Absence of the Specific Gene," the authors summarize their results as follows: The effect of Melibiose on the inheritance of the ability to ferment this sugar has been studied. In the absence of melibiose, a 1:1 ratio of fermentors to non-fermentors is exhibited by the four haploid segregants from an ascus. This is typical of a heterozygous diploid and agrees with the known genetic background of the hybrid employed. When the segregation occurs in the presence of melibiose, all four segregants can ferment the sugar. All four haploids and the clones derived from them can maintain this ability indefinitely if kept in contact with the substrate. When, however, the melibiose is removed, only two out of the four can readapt to its fermentation. These data are explained in terms of adaptive enzymes and their stabilization by their specific substrates in the absence of the gene; transfer of the character from one cell generation to the next is apparently effected by the enzyme molecules contained in the cytoplasm.

GENETICISTS IN THE FIELD

The days of genetic work in indoor laboratories with innumerable milk-bottle cultures of fruit flies are by no means over, but many geneticists working in the newer branches of population genetics and evolutionary problems with genetic techniques are flocking to the fields, to the native habitats of the species they study. One of the most ambitious of these projects is the one set up in the University of Texas and directed by Dr. J. T. Patterson of the Department of Zoology. In a University of Texas publication (No. 4445, Dec. 1, 1944), the fourth part of "Studies in the Genetics of Drosophila" was subtitled: Papers dealing with the taxonomy, nutrition, cytology and interspecific hybridization in Drosophila. In the first of the new series of papers, The Drosophilidae of Mexico, J. T. Patterson and G. B. Mainland described 12 genera and over 100 species. These descriptions are aided by a series of color plates and distributional maps. The saltans group, they conclude, extends from northern Mexico to Paraguay and it is undoubtedly of neotropical origin. Apparently the macroptera group is likewise of neotropical origin since certain species are rather abundant in Mexico and four species occur there while only one of these, macroptera, penetrates the nearctic realm. For the same reasons, the rubrifrons group is neotropical. In as much as Drosophila species have been taken at high altitudes by airplane, nearctic members of this genus may well have been dispersed by air currents into temperate regions of Mexico, and there have become established at any time subsequent to the development of ecological conditions similar to those now existent.

In a short paper J. T. Patterson describes a New Member of the Virilis Group. In the third paper in the volume, R. P. Wagner writes on The Nutrition of Drosophila mulleri and D. aldrichi: Growth of the larvae on a cactus extract and the microorganisms found in cactus. The fourth paper is written by Mary Warters on the Chromosomal aberrations in wild populations of Drosophila. The fifth paper is by Linda T. Wharton on Interspecific Hybridization in the Repleta Group. The sixth by J. T. Patterson and A. B. Griffen is on the Relationship of Drosophila montana and D. lacicola to other members of the vivilis group, and the seventh, A Genetic Mechanism underlying Species Isolation.

POLITICO-GENETICS

In his preface to *Dice of Destiny, An Introduction to Human Heredity and Racial Variation* (Columbus, O., Long's College Book Co., 1945) the author, Dr. David C. Rife, associate professor of Zoology in the Ohio State University, states that no two of us are alike. We differ in size, features, pigmentation, intelligence, vigor, longevity, ability, personality, and a host of other traits. Individual differences depend upon either heredity, or environment, or upon the interaction of the two. Environmental variations are confined to the individual, as they are not transmitted to future generations while hereditary variations are not affected by ordinary environmental conditions. The hereditary factors, or genes, are present at birth and the individual can not alter his allotment of them.

Dr. Rife first explains the principles of heredity as they apply to individual and racial variations. He does not catalogue abnormalities; rather he stresses the normal, non-pathological differences which are quite common, and which are responsible for genetic differences between racial groups. In the book he is not concerned with medical genetics, referring the reader to texts on this subject.

It is refreshing to have a book on human genetics which is not at the same time a rogue's gallery of all the human abnormalities. Heretofore it has been difficult to suggest a text dealing with genetics in relation to man without subjecting the reader to a parade of monstrosities. True, these "bad" genes are as much our heritage as are the "good" genes, but it is likely that the subject of genetics may receive a far better response if, as Dr. Rife has done, the ordinary, normal, common factors are discussed and it is explained how they interact with the environment of the individual who bears them.

Dr. C. L. Hubbs of the University of California, in reviewing *Dice of Destiny,* writing in the *American Naturalist* (79:275-276, 1945) said: "After being surfeited with rebuttals of the Nazi philosophy of racial superiority, all based either on the almost equally unscientific idea that human races do not differ at all in mental capacities or on the still more absurd notion that races do not exist, we find real relief in the appearance of a scientifically sound treatise on human race problems. The human biologist shows himself able to avoid the pseudo- science that seems to pervade in part the thought of many physical anthropologists as well as sociologists."

On the same topic, Dr. Th. Dobzhansky, writing in *Science* (102:234-236, 1945), expresses concern that Dr. Rife, more than some but less than other writers on politico-genetics, is inclined to regard heredity as being rigidly determinant. Dr. Dobzhansky feels that heredity can hardly be taken to stand for "The Dice of Destiny" if its realization depends largely upon the environment which is in part controlled by human will. He asserts that the frequently advanced argument that, because psychic traits in animals are rather rigidly determined by heredity, they are so determined in man does not necessary follow. He believes that the evolutionary pattern of the human species is so different from those of the higher animals (not to speak of the lower ones) that judgment by analogy with respect to the psychic traits has little value. He adds: "It may be that the non-pathological hereditary differences in behavior found among men are merely the uneroded remnants of genotypic specializations that were moulded by natural selection to fit the conditions of ages long past. Genotypes now emerging will perhaps redispose every individual to respond to every challenge that his environment may offer as a social rather than a solitary being."

There is no doubt that with the publication of Dr. Rife's book, the discredited theories of overenthusiastic improvers of mankind will at last be matched with honest, sincere statements based upon the results of modern research into genetics, sociology, and the general biology of mankind. It is well to keep in mind that our knowledge on these subjects is still far from satisfactory. No statement may be taken as the last word at the present time.

EVOLUTION AND PLANT GEOGRAPHY

Part four of Dr. Stanley A. Cain's book, *Foundations of Plant Geography* (Harper, 1944) is entitled Evolution and Plant Geography. In previous parts he had described the scope of plant geography and called it a borderline science because information had to be abstracted from the fields of systematics, evolution, speciation, cytology, genetics, pollen analysis, paleoecology, and aerography, the science of areas. He gives special attention to paleoecology in which subject Dr. Cain (University of Tennessee) is a specialist, and this subject merges with that of aerography which deals with topics of dispersal and migration, centers of origins, discontinuous distributions of organisms, the presence of vicarious forms in special areas. He develops the theory of differentiation in relation to the science of area, the most important advocate for which had been Dr. J. C. Willis and the theory of "age and area." This theory of evolution relegates natural selection to a subsidiary position, acting primarily with respect to adaptation, and accounts for the development of a group through a series of relatively large morphological mutations progressing downward from the family to species. As a consequence of this hypothesis, "taxonomic characters" are rarely concerned with adaptation or natural selection.

In part four, Dr. Cain reviews the principles concerning evolution, speciation and plant geography, the nature of species, isolation causes of species stability, and the rate of evolution and speciation. The fifth section, the last, is concerned with polyploidy, an exceedingly important topic in the mechanisms of species changes, particularly in plants. Dr. Cain made the following statements: 1. Evolution results from the action of one or more of several processes—mutation and hybridization, selection and isolation; 2. Speciation is understood as an ultimate step in evolution with results in discontinuity between populations and which, strictly speaking, depends upon reproductive isolation that results from intrinsic factors; 3. Species are not genetically homogeneous populations and consequently they are composed of individuals which vary in morphological and physiological characteristics within definable limits. Species consist of a number of biotypes, sometimes very large, that are usually not uniformly dispersed throughout the species population but are more or less concentrated in local populations, ecotypes, and geographical races; (Points 4 and 5 are concerned with the species concepts and taxonomic systems); 6. Geographical isolation promotes speciation but it does not of necessity result in speciation; 7. The rate of evolution depends upon the independent and conjunctive operation of a number of factors such as mutation rate; the richness of the population in allelemorphic genes; the replication of chromosomes as in euploidy and aneuploidy; population size; the size availability, and variability of ecological niches; the vicissitudes of environmental change and concomitant migrations, and the nature of selective pressure. There are suppositions of evolutionary cycles or mutation spates, but there are no unqualified evidences of strikingly different mutation rates or of the fact that age of a phylogenetic stock results in evolutionary senility.

A GENETIC TEXTBOOK

Dr. Edgar Altenburg of the Rice Institute of Houston, Tex. has prepared a revised edition of the textbook, *Genetics* (Holt, 1945). Dr. Altenburg has endeavored to place emphasis on the advances in modern genetics, stressing the principles rather than the details of the subject. He begins with a discussion of the physical basis of heredity and quite properly stresses the importance of the behavior of the chromosomes. He then takes up the subject of "heredity and environment" with a discussion of twins reared apart. Mendelian principles are explained in terms of independent assortment. The following subjects are then taken up: Multiple Factors, The Determination of Sex, Inbreeding and Outbreeding, The Genetic Interpretation of Sex, Selection, Lineage, Crossing Over and Chromosome Maps, Crossing Over and Meiosis, Multiple Alleles, Abnormal Chromosomal Rearrangements, Cytogenetic Maps, Genic Balance and Chromosome Number, Mutation, The Artificial Production of Mutations, Balanced Lethals and Chromosome Complexes, Heredity and Development, and The Genetic Basis of Evolution. In this, the last chapter, Dr. Altenburg discusses some of the alternate theories of evolution and then shows that the one dealing with adaptive evolution which comes about through mutations and natural selection is the most acceptable. The author explains the way in which the genes spread independently of natural selection; this he regards as *drift*. He discusses very briefly equilibrium, and mutation pressure in the evolutionary process as well as the importance of geographical and ecological isolation. The importance of interspecific sterility, the changes in chromosome number in evolution are described.

THE TIME FACTOR

While geneticists are mostly concerned with the behavior of particular organisms, they are beginning to appreciate more the history of the special environments in which the organisms live. Ecological notes may be gathered as organisms are collected in their native habitats, but not only present day conditions must be known but the past history of the area must be estimated for a more accurate picture of the organism's evolutionary development.

The recent book *Rocks and Rivers* is not a source book of geological information but it presents a clear and continuous picture of the manner in which the land contours change, how large areas become obliterated in time, and how time is measured by geologists. The book was written by Dr. Ellis W. Shuler of the Southern Methodist University, Dallas, Tex. and published by the Jaques Cattell Press of Lancaster, Penn. In it the earth surface is studied as if it were an organism itself. The story of its origin, development, rapid growth, gradual destruction and obliteration at some point is told in non-technical language. This is one of the "Humanizing Science Series." Dr. Shuler in a well illustrated account, tells the nature and history of the landscape: how the crust is carved, the wastes removed, the nature of soils, the manner in which the lands are sculptured, the nature of springs, caves, and natural bridges. He tells the meaning read in the shore line, the volcanic lands, the boulders and their relation to the ice age, the story of stream piracy, the temporal nature of lakes, waterfalls and the formation of canyons. All these changes take time, and only the geologists and the paleontologists can tell us the meaning of time for evolutionary development.

WATER FOWL EVOLUTION

The method of the application of new techniques and corollary knowledge in the field of systematics in relation to evolution may be seen in the study on "The Family Anatidae" by Captain Jean Delacour, Technical Consultant of the New York Zoological Society and Doctor Ernst Mayr, Curator of Birds at the American Museum of Natural History which was published in *The Wilson Bulletin* (57: 3-55, 1945). In addition to such information as may be obtained by studying the skeleton, appendages, viscera, and feather coverings of their specimens, the authors have reexamined the living birds and their many behavioristic attributes. These features, which are just as much a part of the species as "hard" parts, are grouped under the heading of "Biological Characters" and include such items as the type of pair formation and parental care, the type of courtship and display, the type of nesting habits, the type of food and feeding habits, the question of sterility in some hybrid types, the problems arising from serological tests, the types and behavior of their young, how they stand, how they walk and, of course, how they sound.

One conclusion they reached related to the evolutionary problem is as follows: "The fact that the duck family is so rich in aberrant and primitive genera indicates the great age of this family. However, this is by no means proof that evolution has come to a standstill. Many genera present convincing evidence of active speciation. Incipient speciation is evidenced by the occurrence of about 25 forms which, though we consider them subspecies, are sufficiently distinct to be listed as full species by other recent authors. Nearly completed speciation is evidenced by the occurrence of at least 10 superspecies."

HUMAN ORIGINS

Dr. Fay-Cooper Cole of the University of Chicago, in his presidential address before the American Society of Naturalists on Sept. 14, 1944, entitled "Some Problems of Human Racial Development and Migration" (*American Naturalist* 79:5-13, 1945), said in part that "We accept the idea that all living groups of mankind belong to one and the same species and that the separation into subspecies and races probably goes back toward the end of the Pleistocene. The ways of classifying still lead to some confusion, but I believe the majority will accept the scheme whereby the species is first divided into three main stocks or subspecies—Negroid, Mongoloid and Caucasoid—and these are further subdivided into races, subraces and so on down."

He sees the human species subject to same forces of nature as other species: mutations, isolation, inbreeding, natural and social selection, possible effects of environment and so on. He recalls that archeology shows us that, until the development of agriculture and animal husbandry, mankind was in small hunting and seed gathering groups. Under such conditions variant forms had a much greater chance of becoming established, while natural selection worked more drastically to eliminate those unfit for the conditions under which a group was then living. In illustrating one problem, he mentions the fact that most people think of Africa as the homeland of the Negro, but large and small Negroes are found not only in Africa but in New Guinea on the other side of the world. Traces of this people occur in the present populations or in archeological horizons along the coasts all the way between. It is extremely unlikely that environmental conditions at the peripheries could independently produce the complex of traits by which we define the Negroids. There is much to suggest that, with the possible exception of the Bushman, all the Negro groups are rather recent intruders of Africa. If this is true, we should perhaps look for origins somewhere toward north India.

COTTON EVOLUTION

Dr. R. A. Silow continued his analysis of the evolution of cottons and reported in *The Journal of Genetics* (46:62-77, 1944) from the Empire Cotton Growing Corporation, Trinidad, B. W. I. on "The Genetics of Species Development in the Old World Cottons." In summary his conclusions were as follows: Interspecific genetic differences in Gossypium are only distinguished from intraspecific regional differences by their greater magnitude. Both species and races are in a state of dynamic flux, with genotypes constantly changing, the genes being subject not only to environmental selection but also on the basis of their compatibility with the entire genotypic system. In the origin of physiological isolation there is no indication of Goldschmidt's macroevolution. Although G. arboreum and G. herbaceum may not be held to be distinct species, the same can not be said of G. anomalum, which shows the same kinds of interspecific differences.

The cumulative effects of many gene differences will account for all the taxonomic distinctions in the genus up to the complete sterility level but below that at which chromosome rearrangements become important. G. arboreum races are regrouped and redefined in six geographical races.

Incipient development of sterility between two species provides the evidence that physiological isolation is built up by a gradual process. Among others there is little or no gene interchange in nature, and hybridization leads to complete mutual disintegration of the species' balanced gene systems.

GENETICS AND SEX

Amram Scheinfeld, the author of *You and Heredity* one of the successful popularizers of genetics, has written his second volume on a related topic: *Women and Men* (Harcourt, Brace, 1944). By the use of non-technical language and keenly conceived drawings, Scheinfeld presents the information concerning the differences and similarities of the sexes. While most of his attention has been devoted to the human species, he draws upon the fund of information on sex in the lower forms. His treatment of the determination of sex in man is particularly successful, for he shows how the sex of the individual is determinate at conception by the chance meeting of sperms carrying the X or the Y chromosome with an egg cell carrying an X. He explains that the final outcome depends upon the balance of these sex chromosomes with the other 46 chromosomes. As the human embryo develops, every cell from head to toe differs in the male from that of the female. Beginning with this basic difference, Scheinfeld shows how environmental and sociological factors contribute to further differentiate female from male. Many fields of human biology are explored including the physiological, behavioristic, and psychological factors which separate the world between the sexes.

GRANT TO STUDY GENETICS OF INTELLIGENCE AND EMOTION

On May 7, 1945 the Rockefeller Foundation announced a grant of $282,000 to the Roscoe B. Jackson Memorial Laboratory for studies over a five-year period of genetic factors in intelligence and emotional variation in mammals. According to R. C. Cook, editor of the *Journal of Heredity,* this may mark a turning point in genetic research as it applies to questions of peculiar importance in human society. The research will be directed by Dr. C. C. Little, the authority of the relation of genetics to cancer, who is also one of the most famous dog-breeders in the United States.

ENTOMOLOGY

By Roger B. Friend
Connecticut Agricultural Experiment Station

TAXONOMY

In the field of taxonomy, entomologists have been fairly active and productive, even in contributing to our knowledge of groups of insects of no great economic importance. Borrer published a key to the genera of the Libellulidae of the New World, and Daggy described a number of new species of Ephemeroptera from Minnesota. Several papers dealing with the Fulgoridae (Homoptera) appeared, particularly with those species found in southern regions. Caldwell described several species of Issidae from Mexico and gave an account of the neotropical species of the genus Phrictus. Fennah described a number of new species from South America, and published contributions to our knowledge of the fulgoroid species found on the islands of the Greater and Lesser Antilles and in nearby South America.

This author also discussed certain morphological characters of taxonomic importance in this group and other Homoptera. Metcalf recorded a number of species found in British Guiana and described several that are new. Penner discussed the genus Laccocera of this group and described a few new species. Dealing with other Hemiptera, Beamer revised the cicadellid genus Strangania as it occurs in North America; Usinger published a classification of the reduvioid family Enicocephalidae; Tuthill continued his contributions to our knowledge of the Psyllidae of Mexico, McKenzie revised the coccid genus Parlatoria, and Hutchinson published a key to the New England species of the genus Notonecta.

Among the contributions to the taxonomy of the Coleoptera a few deal with larval forms, Hung-Fu Chu on the larvae of the carabid subfamily Harpalinae, and Ritcher on the Scarabaeidae. Several short papers dealing with adult forms appeared: Dillon and Dillon on the cerambycid tribes Pachypezini and Onciderini; Fisher on the Eucnemididae of Central America and the West Indies; Brown on the chrysomelid genus Calligrapha in Canada; Blake on the chrysomelid genus Galeruca; Potts on the scarabaeid tribe Cremastocheilini. Valentine contributed an interesting discussion of speciation in Pseudanophthalmus.

On the taxonomy of Lepidoptera, Heinrich revised the phycitid genus Fundella, Nabokov wrote an extensive paper on the neotropical species of the lycaenid subfamily Plebejinae, and Forbes classified the pupae of the Geometridae.

Several extensive papers dealing with the classification of the Hymenoptera have been published. Townes contributed the second part of his classification of nearctic Ichneumonidae. Smith contributed a classification of the braconid subfamily Aphidiinae in North America. Pratt published a taxonomic study of the nearctic species of the ichneumonid tribe Cryptini. Cushman described a large number of new neotropical species of the ichneumonid genus Cryptanura. Ross contributed a taxonomic outline of the tenthredinid genus Pachynematus.

Although the taxonomic contributions to our knowledge of Diptera in recent years has been weighted in favor of the mosquitoes, owing to war conditions, other groups have been studied. Alexander continued his descriptions of new species of crane flies, both nearctic and neotropical. A number of taxonomic and descriptive papers on mosquitoes were published, most of them short or dealing with one or a few species, or consisting of lists. Only two are mentioned here. Daggy described the biology and seasonal cycle of *Anopheles* *farauti,* the most important malarial vector in the Australasian region. Aitken published a noteworthy paper on the anopheline complex of western America, dealing with the taxonomy, bionomics, distribution, and disease relationships of the group. Two books on mosquitoes, both by well-known authorities on the subject, appeared—Headlee's *Mosquitoes of New Jersey and Their Control* and Matheson's second edition of the *Handbook of the Mosquitoes of North America.* Townes wrote an extensive paper on the chironomid tribe Tendipedini of the nearctic region, 201 species, with abundant illustrations of morphological characters of taxonomic significance. Although not systematic, the publications on the morphology of the head in Culicidae and Chironomidae by Cook have taxonomic importance, as also does, perhaps, the critique of the conception of the labellum in Diptera by Goldschmidt.

Among contributions to the taxonomy of higher Diptera, Brooks described 26 new species of Tachinidae and Reinhard four new genera and 11 new species of the same family, while Bequaert revised the hippoboscid genus Lynchia.

MORPHOLOGY

In the strictly morphological field Stojanovich discussed the head and mouth parts of the sucking lice (Anoplura). Of particular interest are his views regarding the identity of the three piercing stylets. He regards the dorsal one as the free part of the hypopharynx, the middle as an extension of the salivary duct, and the ventral as the modified ligular. Williams discussed the anatomy of the internal genitalia of beetles, basing this on representatives of males of 11 families and females of 10. The external morphology of the beetle *Calosoma scrutator* was described by Bostwick. Nicholson compared the morphology of the mouth parts of the non-biting blackfly, *Eusimulium dacotense,* with those of a biting species, *Simulium venustum.* The former does not bite because it can not. Ferris has discussed the evolution of the head in insects.

Three papers on blood and on pigment formation are of interest. Yeager's discussion of the blood cell picture and function in the southern army worm is excellent and well illustrated. This author divides the blood cells into 10 main classes and discusses the changes in the kind of cells during larval life and the functions of these cells. The cells of the adult blood are in turn different. The larval stage can usually be determined by an examination of the blood cells. Yeager and Heishman discussed some effects of antisera on the larvae of the above insect. Saline extracts of haemolymph and other tissues were injected into rabbits, and the antisera tested on 5th and 6th instar larvae. Reversible cellular changes in the haemolymph occurred. Metcalf discussed the mechanism of chlorophyll metabolism in the squash bug and its relation to the formation of pigments in the body of the bug.

APICULTURE

In apiculture three subjects have recently received considerable attention by beekeepers, the use of pollen substitutes, the control of American foul brood by the use of drugs, and the poisoning of honeybees by insecticides. Soybean flour, fortified by other substances, is being recommended as a pollen substitute during periods when natural pollen is not available to bees. Haseman tried sulfa drugs as a control for American foul brood. By feeding 0.5 grams of sulfathiazole per gallon of syrup he controlled the disease in badly infected hives and brought the colonies back to a healthy condition. If further research supports these findings, it marks the greatest forward step yet made in the control of this serious disease. The bee poisoning situation is becoming acute and is the cause of much concern among apiarists. The indiscriminate use of insecticides, particularly arsenical dusts, in controlling pests frequently has as an aftermath the elimination of bee colonies. Beekeepers have in the past feared the use of DDT would make matters worse, but this may not be true if future investigations bear out current opinion. In fact, as far as bee poisoning is concerned, DDT appears to be less dangerous than arsenicals.

DDT AS AN INSECTICIDE

The insecticidal properties of DDT and the practical use of this insecticide have dwarfed in effort all other insecticide research. The individual published contributions are too numerous to mention here, but some of the significant phases of research and practice will be noted. First as to the toxic effect on insects, the chemical apparently penetrates the cuticle (it is also a stomach poison) through those thin-walled areas covering sensory nerve terminations. It acts on the nervous system, causing tremors and death. The insects are poisoned when they crawl over a surface coated with DDT in crystalline form, the so-called residual effect, as well as when the DDT is sprayed or dusted directly upon them or when they consume the insecticide with their food. The exact nature of the toxic action has not to date been adequately explained, although many physiologists are working on the problem. The DDT molecule contains lipoid soluble and toxic radicals, and to exercise a toxic effect the toxicant must penetrate the tissues and act on the cells. The epicuticle of insects is of a lipoid nature, and the nervous system of insects contains lipoid material. Moreover, lipoid soluble materials appear to accumulate in the insect nervous system regardless of the mode of entry into the body.

The versatility of DDT as an insecticide is demonstrated by the large number of insect species to which it is toxic. The army louse powder contains 10 per cent by weight. Amounts as low as 0.1 of a pound per acre of water surface are very toxic to Anopheles mosquito larvae. If the walls and ceilings of a room are sprayed with a DDT solution in kerosene so that 200 mg. of actual DDT per square foot are deposited, the deposit remains toxic to flies and mosquitoes for many weeks. A single application of a kerosene solution to a mattress will remain toxic to bedbugs for months. Doses of 0.25 to one pound per acre of forest will control caterpillars which feed on the foliage, including the gypsy moth. The spruce budworm, which is in an outbreak stage in Ontario and Quebec and is present in alarming numbers in Vermont and New York, may also prove to be subject to control by DDT applications. This insect, owing to certain biological peculiarities, has not been successfully controlled by insecticidal applications to date. DDT is an excellent insecticide for the control of the codling moth on apples, the oriental fruit moth on peaches, adult and larval stages of the Japanese beetle, flea beetles and leaf hoppers on potatoes, bugs affecting seed crops, and flies and lice on cattle. On the contrary, some pests are not well controlled by applications of DDT, as the plum curculio, the cotton boll weevil, red mites on fruit trees, certain species of aphids, the 17-year locust, etc.

In the practical application of insecticides the formulation of materials is important. DDT is quite flexible in this respect. It is not soluble in water but is soluble in a large number of organic solvents. It can thus be used in pure solutions. It can also be mixed with certain other materials and used as a suspension in water or as an emulsion. For dusting purposes it can be mixed with carriers to any desired content.

With such flexibility DDT lends itself to application by various types of distributing apparatus, in particular those adapted to the distribution of concentrated mixtures. Experiments have demonstrated that concentrated solutions of DDT can be applied by aircraft, either the standard type of plane or the helicopter, and by certain ground machines which have been termed "mist blowers" and "smoke generators." Several types of apparatus are under development at the present time and appear to be very promising for future use, both for the protection of agricultural crops and forest trees, and for the elimination of insects hazardous to human health, as mosquitoes and flies. For household use, DDT can be applied by either the ordinary type of household spraying apparatus or by means of the so-called "aerosol bombs." The latter have, of course, been successfully used by the armed forces of the nation for some time, and thousands have been sold to the public since the end of the war.

The effects of DDT on warm-blooded animals have been and continue to be investigated. The chemical is certainly toxic to warm-blooded vertebrates when taken in sufficient quantity, but it does not appear to be quite so toxic as more orthodox insecticides such as lead arsenate. For that reason Federal officials have placed a tolerance of seven milligrams per kilo on fruits and vegetables offered for sale on the market. One of the disturbing factors about DDT is the recently demonstrated transmission of the insecticide through the milk of mammals. Just what effect this will have upon its use is problematical.

In as much as this insecticide is being experimentally used on forest areas for the protection from insect pests, for which purpose it offers great promise, its effect on so-called wild life has also been investigated. It is quite toxic to fish and other cold-blooded vertebrates, and the elimination of insects in forest areas may have some effect on the bird population, either by poisoning nestling birds which are fed poisoned insects, or by driving away adult birds from the insect depleted areas. This matter is also being thoroughly investigated, and sufficient data should be obtained in the near future to arrive at some conclusions in the matter. However, by proper timing and by reducing the amount of material used in the forest, it is hoped that no great effect on wild life will be caused by its application.

ORGANIC INSECTICIDES

The development of DDT has stimulated a great amount of research in organic insecticides, particularly by the chemical industry, and future developments of interest and practical importance may be expected along these lines. It would be a boon to economic entomologists to be able to get away from metallic compounds. One material in particular, Gammexane, looks very promising at the present time. Chemically this is hexachlorocyclohexane ($C_6H_6Cl_6$), of which the gamma isomer is the important constituent. In some respects this is more toxic than DDT, but whether or not it will be so generally useful remains to be seen. Recent investigations of insecticides used by the Germans during the war for control of various pests, including body lice and bedbugs, have brought to light several compounds including mixtures containing DDT. The future use of these is problematical.

ECOLOGY OF INSECTS

In regard to the general ecology of insects, Wellington has published some very interesting information regarding the conditions governing the distribution of insects in free atmosphere. This is of considerable importance in the distribution of many insect pests, and Wellington stresses particularly the importance of ascending air currents (that is thermal convection currents) in distributing flying insects over the countryside. He concludes that under the usual conditions the insects are not exposed to lethal temperatures when so carried. Ludwig discussed quite at length the effect of atmospheric humidity on animal life, particularly among invertebrates, a subject of great interest to insect ecologists.

An interesting paper on the ecology of insects was published by Williams, who gave a statistical analysis of the relative number of individuals and species in a population according to a formula developed by R. A. Fisher, using as material Lepidoptera captured in light traps at certain stations.

He employs the logarithmic series and the "Index of Diversity" for interpreting biological results relating to the sampling of populations. The ecology of the Japanese beetle has been a subject of interest for some years, and Hawley and Dobbins recently discussed the distribution and abundance of the Japanese beetle for a nine-year period from 1935 through 1943, in which they emphasize the importance of certain factors that influence the general behavior of the beetle population. They conclude that the most important population depressors in the generally infested area are lack of rainfall and the so-called "milky disease" of the grubs, the former being an irregularly intermittent factor, and the latter being population dependent.

INSECT SPECIES

Among the many publications dealing with certain species of insects several are of general interest. Weber discussed at some length the biology of fungus-growing ants in Trinidad, this being a continuation of previous papers on this interesting group. He includes biological notes on a large number of species found on this island. The utilization of insects to control cactus has been a subject of interest for a number of years. The paper by Bugbee and Reigel on the cactus moth, *Melitara dentator,* in western Kansas is a contribution in this field. This insect bores in the pads of the plant and has reduced the cactus stands 50 to 75 per cent in certain parts of Kansas. Given adequate cover, plus sufficient rainfall, the larvae serve as a very material check on the prickly pear cactus in short grass range lands. It is interesting to note that these authors find that overgrazed range lands, where considerable dusting may have occurred, never yielded many infested cactus pads.

Many sucking insects inject toxic materials into plant tissues during the feeding process. At the same time virus diseases may be transmitted by such feeding activities from infected to healthy plants. The curly top disease of beets and aster yellows are virus diseases in point. However, Severin *et al.* have discovered that certain symptoms resembling those of curly top or aster yellows could be induced by the injection of the saliva of *Xerophlora vanduzeei,* that these symptoms are not the result of the injection of a virus into the plant but are owing solely to salivary action. The symptoms are not transmissible and are systemic in the plant.

PUBLICATIONS

Among a number of books, some of them popular or semi-popular and some of them purely scientific, which were published during 1945, a few should be mentioned. W. R. Thompson *et al.* published two more parts to the *Catalogue of the Parasites and Predators of Insect Pests.* This is a very important and significant contribution to the parasitology of insects. Pyenson published a small book on pest control in the home garden which is of particular interest to the layman. Mallis wrote a handbook of pest control which deals with household pests and should be very useful. Horsfall's recent contribution, entitled, *Fungicides and Their Action,* should be of great interest to entomologists as it covers several important phases of plant protection and brings the problem up to date. Among the popular books a most interesting volume was published by Beebe entitled, *The Book of Naturalists.* Several sections are of particular interest to entomologists, as those by Réaumur on ants, Wallace on mimicry, Maeterlinck on bees, Wheeler on termites, etc.

BOTANY

By HOWARD J. DITTMER
ASSISTANT PROFESSOR, UNIVERSITY OF NEW MEXICO

EVOLUTION

Philosophical treatises and papers of a general character were more prominent in the evolutionary field in 1945 than studies of a specific nature. However, many articles that could appear in this category will be found under the titles Genetics and Cytology.

Among the specific studies was one made by Cleland on the genetic relationships in the genus *Oenothera*. He considers the several great groups as of hybrid origin, but, because of their self-pollinating habit, they can not be readily distinguished from each other phenotypically. Another outstanding report was by Babcock on the genus *Crepis*. His cytological studies of the chromosomes of various species of *Crepis* enabled him to arrange the members in a phylogenetic sequence which he correlated with previous systems. He also emphasizes the role of geographic distribution, gene mutation, and differentiation of species under pressure of natural selection in the twenty to thirty million year interval since the origin of the genus.

CYTOLOGY

Investigators in this field contributed some excellent papers on chromosome studies of many different plants. Included plant groups were members of the genera *Vaccinium, Lupinus, Hyacinthus, Pisum, Lolium, Gasteria, Tradescantia, Betula, Salix* and many others.

A monograph on the technique of using the electron microscope in plant cytology was published by Elvers. He reports that the tissue is first embedded in paraffin and then cut very thin. After treatment with xylol and chloroform, the tissue was dried. This apparently did little or no harm to the tissue. It is Elvers' conclusion that the electron microscope can reveal more than ordinary microscopes in cytological studies.

Epstein described a water method for rapid demonstration of mitotic divisions in *Allium cepa* root tips. A one-minute boiling water bath is used in place of the usual 18 hours fixation with Carnay's solution.

Among the interesting chromosome count papers, Johnsson studied 17 trees from different parts of Sweden of the species *Carpinus betulus* and found N=32 and 2n=64, in contrast to number N=8 found by other authors. Mahabale and Gorji, two investigators of the Bose Research Institute in Calcutta where much excellent work is being done, found that *Riccia himalayensis* had seven long chromosomes and one short or N=8. In most species of Riccia 2N=8.

GENETICS

X-ray induced mutations were obtained by Jacob working with Jute. The mutants grew to a height double the controls but were without lateral branches. The new forms were not desirable. Nielsen studied the chromosome number of 59 races of *Panicum virgatum* and found a wide polypoid series of somatic chromosomes. Over 7,000 comparisons were made with significant growth differences determined and not influenced by the environment.

Powers revealed that crosses made between inbred tomato lines showed no heterosis but were intermediate between the parents. The hybrids did produce more fruit by weight than either parent. Allen reviewed the genetics of Bryophytes covering 107 articles and discussing such subjects as heteroploidy, monoecism and dioecism, sex chromosomes, intra- and inter-specific compatibility, mutations involving sex characters, vegetative characters and genetic analysis.

These same subjects were covered by a great many authors and investigators, including Anderson, Cooper, Goodwin, Lindegren, Newcomer, Bergner, Lammerts, Artswager, Sax, Tysdal, and Gustafson.

Fungi, which were prominent in genetics studies, were *Neurospora, Penicillium, Aspergillus,* and Yeast. Morphological investigations and nuclear behavior in the formation of fruiting bodies were particularly observed.

Plants of economic importance had a top priority in the genetics studies because of the great importance these plants have today and the promising future they will have when even more is known about them. Increases in yield, quality, disease resistance, and vigor often follow changes in the plant's chromosome complement. Workers in our Federal and state agricultural research stations have contributed much in this direction. Private research institutions and university faculties have also made eminently valuable discoveries and developed ordinary plants to a high degree of yield and perfection.

ECOLOGY

Erosion studies again confirmed the reports that crop rotation proved better than continuous cotton, while continuous cotton was better than bare fallow. Grassed waterways for handling runoff from agricultural areas were carefully checked. Bermuda, Italian ryegrass, redtop, and orchard grass form a good lining for such waterways.

Southwestern lands were studied considerably with a view toward their greater yield under methods of water spreading. Promising results have been made in many sections as a result of these experiments.

Control of Klamath weed by using Ammonium sulfamate and commercial borax was investigated by Allgair. Twig elongation near New Orleans was observed by Penfound and Borck. Shull made some observations of vegetational changes on an island in the Mississippi, while Godwin analyzed pollen of the Quaternary period from post-glacial bogs.

In the limnology section, Biswas wrote of the important role salt and fresh water plants play in maintaining life for animal organisms. Seaweeds are used for food, culture media, heat and cold insulation, manufacture of I, C, K, Ca, N, SiO_2, and manure. Diatoms are used in the manufacture of dynamite. Such studies indicate that we are making very little use of plankton and much could be done in this direction.

MacDougal and Dufrenoy studied mycorrhizal symbiosis in *Aplectrum, Corallorhiza,* and *Pinus.* Stover described the varying structure of conifer leaves in different habitats. Hall and Penfound continued their investigations of the American lotus and included a description of the anatomy and morphology. The survival of buffalo grass following as much as 19 months submersion and under as much as 59 inches of water was reported by Porterfield.

Holscher studied the effects of clipping bluestem wheatgrass and bluegrama at different heights and frequencies. His recommendation is that these grasses in pasture be given time to recover by non-grazing at certain periods since clipping and therefore grazing injures the plant and slows its growth.

Weaver and Zink described the longevity of the seminal roots of certain grasses. They confirmed earlier studies that grass seminal roots are persistent and not ephemeral as once believed.

SYSTEMATIC

G. W. Martin described new species in *Pseudovalsa, Sebacina, Pellicularia, Peniophora,* and *Cymatella.* He also described the fungus genus *Cheiromyces* including a new species *C. digitatus* and discussed the relationship of this genus to other genera. F. J. Seaver made another contribution in the mycoflora of Bermuda, including the descriptions of ten new species.

A study of hepatics in Canada was made by Brinkman, while Bryophytes of Greenland were described by Lee.

Coker listed the woody Smilaxes of the United States, reducing the number of species to 11 of which nine are in the eastern temperate part of the country.

All groups of the plant kingdom were represented in the various systematic sections but space does not permit the inclusion of very many of them. Most systematic papers of the higher plants come from less populated areas, particularly tropical.

Tiffany studied the Oedogoniales of Florida. Schweinfurth reported on a number of Peruvian plants. Moldenke published new data on several groups of tropical plants, including the Verbenaceae and Avicenniaceae. Harrington continued his study of Rocky Mountain flora with a key to some Colorado grasses in vegetative condition.

Paleobotany included papers by Chaney, who described a fossil cactus of Utah; Banks listed a new Devonian lycopod genus from southeastern New York called *Colpodexylon;* Arnold reported on a heterosporous species of Bowmanites from the Michigan Coal Basin—based on compressed strobili; and Wilson reviewed spores and pollen as microfossils, including studies of the microfossils of Paleozoic, Mesozoic, and Cenozoic age.

MORPHOLOGY AND ANATOMY

Sharman described leaf and bud initiation in the Gramineae. Sinnott found that in cucurbits growth caused, either by cell division or by an increase in size of cells, increased dry weight in proportion to size and therefore could conclude that the dominant biological individual here concerned is the organ as a whole rather than any of the cells which compose it.

Johansen reviewed the present status of plant embryology. He declared that many botanists are unaware that embryology is an exact science. Following his study of the anatomy of peach and cherry phloem, Schneider concluded that the bark of cherry is thicker than that of peach because the old secondary phloem of cherry undergoes little crushing.

Various types of periclinal chimeras in Datura in relation to the development and structure of the ovule were reported by Satina. Walton described the roots of *Equisetum limosum* L. and compared them with the roots of Calamites. The roots have hexarch xylem. Lewis studied the geometry of growth and cell division in columnar parenchyma. The foliar sclereids of *Trochodendron Araloides* were described by Foster.

The embryology of *Paspalum dilatatum* was studied by Bennett who found that the embryo matured 14-18 days after pollination. Isenberg described the anatomy of redwood bark. He stated that the bark was composed of secondary phloem, living and dead, and periderm. A detailed description of the ontogeny and anatomy of the apple leaf was given by MacDaniels and Cowart.

MINERAL NUTRITION

Lindner and Harley studied the nutrient interrelations in lime-induced chlorosis on pear, apple, peach, and cherry based on leaf analysis of Ca/K balance. Fe was usually low in chlorotic leaves but occasionally it was higher than in green leaves. N, P, and Mn were found to be in no way correlated with lime induced chlorosis. It was suggested that, in Calcareous soils when Fe approaches the limiting level, an upset in Ca/K balance may induce chlorosis by preventing the formation of an iron-containing enzyme which functions in chlorophyll synthesis.

Manganese as a substitute for magnesium in the metabolism and anabolism of the cell was noted in one study. Another noted that absorption of selenium by corn from *Astragalus* extracts was much greater than from Na selenite. Babicka found that some plants absorb gold in colloidal form but none in metallic form. The amount is small, and whether or not it is necessary for vital activities is unknown.

Iron and Mn in plant nutrition were discussed by Pearse who noted identical pathological symptoms with an excess of Fe and a lack of Mn, and those symptoms induced by an excess of Mn were identical to a lack of Fe. Kramer reviewed the absorption of water by plants and Arnon and Hoagland reviewed plant nutrition studies by artificial culture methods.

AUXINS, GROWTH SUBSTANCES

Rooting substances—indolebutyric acid, naphthalenacetic acid, and naphthalene acetamide—by the concentrated dip technique proved very beneficial in the rooting of *Derris* and *Lonchocarpus*. Induced fruit setting and in many cases production of seedless fruits by 4-chlorophenoxyacetic proved effective by the aerosal method. The growing of seedless fruits by use of chemicals was discussed, especially for tomatoes and cucumbers. These are a few of the many interesting and beneficial experiments conducted during the year with our new growth substances.

Further experimentation will undoubtedly yield many additional desirable fruits and induce the rooting of difficult plants. The future of auxins is indeed bright.

VITAMINS

Fa, Cheng, Roy showed that dry seeds of soy bean had practically no ascorbic acid, but upon germination it greatly increased, reaching its maximum about the fifth or sixth day and thereafter declines. Gustafsson and Schroderheim found that fertility of the tips in several spp of *Rosa* was greater with a lower ascorbic acid content.

PHOTOSYNTHESIS AND PIGMENTS

Chlorophyll, carotenoids, and other pigments of the chief algal classes were reviewed by Cook. A consideration of the photosynthetic activity of the pigments and relation to sexual reproduction in *Chlamydomonas* was given. Stodola isolated the new pigment penitrinic acid ($C_{15}H_{17}O_5N$) from cultures of *Penicillium notatum*.

Several papers on the yield of O_2 production by chloroplasts suspended in various solutions were presented. Studies on the fluorescence of chlorophyll, both *a* and *b* were made by Zscheil using fourteen different solvents. The effects of concentration, reabsorption, temperature, and fading were considered.

Seybold restated his theory that chlorophyll *a* is concerned with the formation of glucose whereas chlorophyll *b* is involved in the polymerization of glucose to form starch. The theory is based on the phylogenetic correlation of chlorophyll *b* occurrence and starch formation.

Fox *et al* examined mud samples of great age from the ocean floor for their carotenoid and chlorophyllous degradation products. The results were discussed in relation to marine biological pigments and to petroleum formation.

GROWTH AND REPRODUCTION

Hildebrandt and co-workers successfully cultured excised tobacco and sunflower tissue in vitro. The tissues grew best where sugar was high and pH was about 5.9.

Temperature and growth relations of the roots and hypocotyls of cotton seedlings were studied by Arndt. He found protrusion of the radicles occurred most promptly at 33° C. Variations in optimum temperature for best root development were noted with different ages in the roots.

Anderson, Edgar, and Schregardus noted that length of internode in plants was more the result of heredity and hormone factors than any external factors. Cultures of excised stem tips of *Asparagus officinalis* were maintained for nine months through 20 successive transfers by Loo. Developmental responses in isolated plant tissue were observed by White. His results indicated that genetically induced tumors could be controlled in growth pattern by manipulating the conditions of aeration of the culture.

GERMINATION AND DORMANCY

Anderson found that freshly harvested Kentucky bluegrass seed will germinate satisfactorily. Filter paper moistened with N/100 KNO_3 increased germination. *Scirpus* seeds required three to six months of moist stratification at 2-4° C. before germination for the 14 species studied. The large-seeded forms often still will not germinate unless treated to conditions of high illumination and temperature. Mechanical methods and H_2SO_4 treatment were not effective.

Treatment of clover (*Trifolium* spp.) for germination showed variations in the amount of dormancy required. Generally the longer the dormancy period, from 4-16 months, the sooner the seed germinated after sowing.

A good many experiments were conducted to determine the longevity of seeds. Generally the experiments showed that increased moisture in the atmosphere of the storage houses increased the length of time seeds may be stored with high viability. Crocker discredited stories of viable mummy wheat. He found that cereal seeds do not live beyond 25 years in ordinary air storage. *Nelumbium* has been found to live 250 years in a herbarium as the oldest known living seed. It was suggested that age-degeneration of dry seeds is caused by gradual degeneration of the nuclear mechanism.

OSMOSIS

Branner and Branner of the University of Istanbul, using cellophane membranes and also bean seed coats, found that permeability to water was greater under acid than under alkaline conditions. It was concluded that H-ions neutralize the negative charge of the micellar structure thus resulting in a decrease in swelling and a reduction in the electrostatic braking force to which water threads moving through the membrane are subjected.

Beams and King centrifuged pollen grains of *Vinca rosea* at 20,000 times gravity. As a result, 70 per cent of the pollen tubes germinated on the centrifugal side. Displacement of hormones, enzymes, or the establishment of a physiological polarity by such displacement are possible explanations of these results.

Steward *et al* investigated the absorption and accumulation of solutes by living plant cells. Time and temperature effects on salt uptake by potato discs and the influence of the storage conditions of the tubers on metabolism were included.

RADIATION EFFECTS

Gupta and Sen found that reducing the length of day by about three hours on Jute induced much earlier flowering and resulted in shorter plants, fewer leaves, and nodes but more branches.

Rooting greenwood cuttings of *Citrus, Hibiscus* and other plants was more successful under controlled conditions in a basement with fluorescent lamps than in similar controlled conditions in sunlight.

White found that Canadian Wonder beans produced 71 per cent greater yield under a 9.1-hour day than under the usual 11.3 hours of light.

Driver and Hawkes experimenting with potatoes found little effect in length of day. They suggest that flowering with the potato is not dependent on the photoperiodic mechanism but rather on the quantity of light received.

Olmstead studied the growth of twelve geographically different strains of side-oats grama by planting them in a Chicago University greenhouse. The varying responses to the Chicago latitude suggest that grama will reasonably well adapt itself to different latitudes.

Many more studies were made on the effects of radiation including different wave-lengths and varying photo-periods. The increasing number of papers presented this year in this section of Plant Physiology certainly indicates its primary significance.

ENZYMES

Most of the work on enzymes this past year was reported from foreign countries, namely, Sweden, France, Austria, England, Russia, and India. Two plants appearing prominently in the literature in this connection were the sugar beet and potato.

One United States paper reported an enzyme system isolated from the potato that is capable of catalyzing the conversion of glucose—1—phosphate into a polysaccharide which is probably the amylopectin component of natural starch.

A few Russians observed seasonal fluctuations in the direction of activity of invertase and its bearing on the accumulation of sugar in sugar beet.

TOXICITY

Trelease investigated the influence of plant extracts, proteins, and amino acids on the accumulation of selenium in plants. He noted the effect of Se accumulation in one of the few recorded cases in which an organic compound has been shown to increase the absorption of an inorganic element by plants.

Studies of certain herbicides in soils disclosed that ammonium thiocyanate is extremely toxic when first applied to soils. It is not readily available in soil and becomes soluble slowly; it gradually increases the soil fertility. Juglone, the active agent in walnut toxicity, has been used as a cure for bacterial and fungus diseases of the skin.

PHYTOPATHOLOGY

Diseases caused by fungi, bacteria, viruses, animal parasites, and seed plant parasites covered most of the work done by plant pathologists in 1945. The major work was done by investigators in the state and Federal Departments of Agriculture, whose chief concern was the applied nature of the diseases.

The papers were far too numerous to mention, but one of the rare diseases included was Oak wilt. This disease is caused by the fungus *Chalara quercina* getting into the vascular tissue. The infection is extensive among oaks in western Wisconsin and the upper Mississippi Valley. The fungus infects trees of all sizes and ages in whatever kind of soil or situation grown. Red and black oaks are more susceptible than white and bur oaks.

Non-parasitic diseases were less prominent in the literature but their significance from an economic standpoint is certainly great in some areas. Calcium deficiency, sodium carbonate as a toxic substance in water, and many others were reported. One paper from the cotton districts of Turkey told of a condition known as Topallik disease, characterized by lack of roots and the consequent drying up of the plant. The malady is ascribed to an abnormal rise in the salt content of the soil during summer drought.

ECONOMIC BOTANY

By H. K. Wilson

Head, Department of Agronomy, The Pennsylvania State College

REE WHEATGRASS

Ree wheatgrass (*Agropyron intermedium* and *A. trichophorum*), a new hay and grazing crop introduced by the U. S. Department of Agriculture from Russia, has been released by the South Dakota Agricultural Experiment Station. Franzke (South Dakota Agr. Exp. Sta. *Cir. 58,* 1945) reports that the new grass has proved very drought-enduring and better able to withstand more heat and dry weather than brome grass. Also ree wheatgrass is very cold resistant and does well on a wide range of soils. It is more tolerant of alkali soils than is crested wheatgrass. Franzke believes that the new crop is highly nutritious and palatable to all classes of livestock.

It is recommended that ree wheatgrass should be seeded in grass mixtures for pastures as it starts growth very early in the spring and remains green until late in the fall. The best hay is produced when the plants are harvested in the early bloom stage.

MUNGBEAN

The mungbean (*Phaseolus aureus*) is an annual legume, native of southern Asia where it has been grown for many years as a human food and forage crop.

Ligon (Okla. Agr. Exp. Sta. *Bul. 284,* 1945) reports that the crop is gaining in favor in Oklahoma because of its value for soil building, hay, silage, and pasture; also the seed may be used for livestock feed. Some types of mungbeans are utilized in growing bean sprouts for certain Chinese foods.

The mungbean plant is fairly free from disease and insect pests and is adapted to the same general area as the cowpea. The principal varieties are of the Golden Mung and the Green Mung, the names being based primarily on the color of seed. Some improved strains have been developed. Selection No. 12 is being multiplied and distributed in Oklahoma.

METHODS OF FORAGE HARVESTING AND STORING

Agriculturists are changing their methods of harvesting and storing forage products. It has long been recognized that many losses may occur during the time that a forage is ready for harvest and its ultimate consumption by livestock. A question of considerable interest is the proper time of harvest. Dexter (*Jour. Amer. Soc. Agron. 37:* 394-99, 1945) has made studies on the yield and sugar content of alfalfa hay cut at various times of the day.

No significant increases in the sugar content of alfalfa hay occurred from morning until night nor were there large decreases from evening until the following morning. When the alfalfa was in the halfbloom stage, it increased in dry matter yield about 100-300 pounds per acre per day. When the day was clear, there was a small but rather consistent increase in the percentages of sugar and starch as the day advanced. Rapid drying resulted in much less loss of sugars and starches than a slower rate of drying. Hay that was dried slowly in the mow lost much more sugar than that dried under ordinary field-curing conditions.

ALFALFA

Agronomists have long been concerned with the problems of alfalfa seed production. In some sections of the country it has been almost impossible to produce a crop of seed. Even in such areas, occasionally a heavy set of seed occurs; yet it is extremely difficult to determine the factors responsible.

Grandfield (*Jour. Agr. Res. 70:* 123-32, 1945) studied the relationships between organic reserves, air temperature, humidity, and soil moisture and alfalfa seed production under the conditions prevailing at Manhattan, Kan. He found that the optimum temperature for seed sitting was 80° F and that seed development was hindered when temperatures rose above 100°. Fertility increased as the relative humidity decreased from 90 to 10 per cent. When the temperature was 80° F lowering the relative humidity from 90 per cent to 10 per cent resulted in an increase of pods set of 24 per cent.

A high level of organic reserves gave an increased production of seed and the effect of the reserves was augmented when the soil moisture content was low. When the reserves were low, seed production was favored by high soil moisture.

An environment which gave a moderate air temperature, low humidity and low soil moisture resulted in a type of vegetative growth favoring the storage of high organic reserves and a physiological condition favorable to seed setting.

POTATOES

The storage of potatoes for any length of time presents numerous problems. The grower, in particular, frequently experiences considerable loss as the quality of the tubers falls rapidly when sprouting occurs.

Thomas and Riker (*Amer. Potato Jour. 22:* 104-13, 1945) report that the sprouting of Chippewa, Cobbler, Red Warba, Russet Burbank, Russet Rural, and Triumph varieties of potatoes stored at temperatures above 70° F was prevented for some time when treated with about 0.03 oz. of the methyl ester of alpha naphthaleneactecic acid per bushel. This chemical proved the most effective of the several included in the trials and appeared to offer a solution to certain potato storage problems.

Poisoning from sorghums has long been a serious problem confronting the farmer. Franzke (South Dakota Agr. Exp. Sta. *Cir. 57,* 1945) has developed a variety of forage sorghum, named Rancher, which he states has the lowest hydrocyanic acid content of any named forage sorghum in production. The new variety was produced by crossing two strains of Dakota Amber sorgo. Rancher is early maturing, medium in height, and produces somewhat heavier and leafier stems than Dakota Amber 39—30-S. It matures in 90 to 100 days and is adapted to all parts of South Dakota and to a wide range of soil conditions.

OAT IMPROVEMENT

The improvement of varieties of economic plants is a constant goal of the plant breeder. During recent years considerable attention has been paid to the breeding of disease resistant varieties of oats. Coffman, *et al* (*Jour. Amer. Soc. Agro. 37:* 479-98, 1945) report on the improvement and distribution of spring-sown red oats.

The spring red oat region is a belt from coast to coast across central United States, exclusive of the mountainous and desert areas, and includes the southern Corn Belt southward to the Cotton Belt where it overlaps with the fall-sown oat sections.

The need for developing rust and smut resistant varieties led to the initiation of hybridization efforts in 1926. Fulton, a smut resistant variety, was distributed in Kansas in 1939.

A crown rust resistant variety known as Victoria was introduced from South America and used in the making of numerous crosses with other varieties. From the Victoria X Richland crosses there resulted the Corn Belt varieties Boone, Cedar, Control, Tama, Vicland, and Vikota. Fultex was developed from a cross of Victoria and Fulghum. In 1931, it was discovered that the variety Bond possessed resistance to crown rust, and many crosses have been made with other varieties.

The results of these efforts have led to varieties possessing early maturity, high yielding ability, and resistance to the rusts and smuts. Of the more recently developed varieties, Ventura was distributed in California in 1944 and Osage and Neosho in Kansas in 1945.

SIMULATED HAIL

In many sections of the country great damage frequently results from severe hail storms. In the Corn Belt much damage is done to the corn crop each year and many growers protect themselves with hail insurance. It has always been a great problem to determine just how much damage was done by the hail and thus to affect a fair means of settling the claim against the insurance company.

Kiesselbach and Lyness (Nebr. Agr. Exp. Sta. *Bul. 377,* 1945) have conducted a series of controlled experiments in which they attempted to stimulate the damage done to corn by hail. Several mechanical devices were used to injure the corn plant. Leaves were shredded with a rasp-like instrument made from a narrow board with sharp, projecting nails. Also the stalks were bruised by striking them with a flail made of 10 wires each with the beating end rolled into a smooth round knob about the size of a hazel nut. In addition plants were defoliated at various stages of development.

For an average of nine years, plants cut off an inch above the ground level, when eight inches tall, yielded 67 per cent as much grain as untreated plants and 32 per cent when similarly cut off at a height of 16 inches.

In the early tassel stage, complete removal of the leaves reduced yield more than 99 per cent as compared with a normal grain yield. When approximately one-half of the leaf area was removed from the lower portion of the stalks, yield was 80 per cent of normal as compared with 41 per cent of normal when the leaves from the upper half were removed.

Yields were reduced from 46 per cent to 95 per cent of normal as a result of flailing the plant, with the damage being least at the early stages of growth as this permitted some recovery. Greatest reduction occurred from injury during the period between initial and full tasseling.

CORN

In the greater part of the Corn Belt, farmers are confronted with the possibility of a soft corn crop nearly every year. Soft corn is that corn which is not thoroughly matured at the time of frost and may spoil if special care is not taken to insure proper drying. The tendency of farmers to grow later maturing varieties tends to aggravate the situation.

During the growing season of 1945 rainfall was high and in general corn was late in maturity. Throughout much of the country a good deal of the crop failed to mature before frost. A new publication by Shedd (U. S. Department of Agriculture, *Far. Bul. 1976,* 1945) deals with the problems of handling and storing soft corn on the farm.

Some of the suggestions to reduce losses are: 1. Delay harvesting as late as possible; 2. Properly prepare the crib; 3. Do not harvest when corn is wet; 4. Thoroughly clean the corn to remove husks and silks; 5. Sort the corn to remove most immature ears; 6. Screen out the shelled corn and dirt at time of placing in the crib; 7. Provide ventilation for the crib; and 8. Place the corn in small cribs or piles to facilitate rapid drying.

A little extra care may make it possible to save a crop that may otherwise lose much of its value. Those growers who are feeding livestock have an opportunity to feed the more immature corn and thus reduce losses from spoilage.

POPCORN

In spite of the fact that popcorn is considered a luxury crop, there has always been a steady demand for a considerable quantity. During the war period consumption increased greatly, probably in part a reflection of the general level of available cash and the tendency for the public to consume greater quantities of luxury types of food stuffs.

According to Brunson and Smith (*Jour. Amer. Soc. Agro. 37:* 176-83, 1945) the popcorn crop of America in recent years fluctuated between 50,000 and 100,000 acres per year or about 0.1 per cent of the total corn acreage of the United States.

It has been possible to develop hybrids that have outyielded the better open-pollinated types. Also the new hybrids have possessed greater ability to withstand lodging, thus making them work suitable to harvesting with a mechanical corn picker.

Since the value of the popcorn lies in the quality of the final product much attention has been given to this phase of improvement. Through breeding it has been possible to secure much greater expansion from a given quantity of corn. Nearly all consumers of popcorn appreciate a tender, fluffy product that is free from a hard and unpalatable core. Freedom from objectionable hulls is desirable since their presence greatly lowers the quality of the popped corn.

Considerable progress has been made in making available to the public superior sorts of popcorn. The Minnesota Agricultural Experiment Station, in 1935, introduced the first commercial hybrid popcorn. The hybrid, minhybrid 250 gave a 16 per cent increase in yield and the grains were 29 per cent higher in popping expansion than the open-pollinated hull-less corn used as a check. Several other stations are engaged in the improvement of hybrid popcorn with the Purdue and the Kansas Agricultural Experiment Stations making notable contributions.

WHEAT FLOUR

The flour miller and the baker are confronted with the varying demands of the consumer since their success or failure is directly dependent upon satisfying these demands. With the development of new varieties of wheat, the problems of the flour industry have been complicated greatly. There is the never ending discussion of the interrelationships between heredity and environment.

Harris, Sibbitt, and Scott (*Cereal*

Chem. 22: 75-81, 1945) have investigated the effects of variety and environment on certain properties of North Dakota hard red spring wheat flours. Some 56 samples of flour were milled from wheat grown in North Dakota in 1943. A total of eight varieties was grown at each of seven locations in the state.

The authors reported very significant variations in flour yield, ash, protein content, and loaf volume between varieties and environment, with environment exerting the greatest influence. Significant differences in loaf volume of the bread were shown between varieties and stations where grown. Mixograms secured at uniform levels of protein indicated significant variations between varieties and environments for dough development stage, range of dough stability, curve height, and width.

SOIL FERTILITY

The maintenance of fertility is the concern of every farmer and naturally he is greatly interested in methods which require the least outlay in cash. For this reason, proper rotations and the use of residues and so-called crop wastes have been advocated by soil scientists for many years.

At the Pennsylvania Agricultural Experiment Station are located the oldest long time fertility plots in the Western Hemisphere. In a recent report by White, Holben, and Richer (*Jour. Amer. Soc. Agron. 37:* 21-31, 1945) rather startling results were brought to light. At the end of 72 years of experimentation, untreated grassland areas that had been undisturbed and had received no treatment throughout the years were higher in their nitrogen and organic matter content than any of the plots regardless of the rotation or treatment.

As the authors state, the results emphasize the importance of nitrogen fixation in the maintenance of soil fertility. The only source of energy materials supplied to the grassland soils was the sloughed off roots of grasses and weeds. These results are particularly impressive when related to a planned system of soil conservation.

WEEDS

Those undesirable plants, commonly classed as weeds, occasion great losses and require much additional labor each year. A rather recent development in weed control has been the use of so-called flame cultivation. Barr (Louisiana Agr. Exp. Sta. *Sugar Bul. 22:* 185-7, 1944) reports on trials made to control weeds in sugar cane. Over a period of three years test plots were subjected to the use of a flame to burn the weed plants. In some cases the cane was injured but the effect was temporary as the burned plots outyielded the control plots by 1.3 tons per acre. The cost of burning the weeds was computed at 60-80 cents per acre as compared with $6 per acre for hand hoeing. Under normal conditions, it was necessary to burn from three to four times during a season but the number of flamings will vary with the season.

Although many farmers prefer to use chemicals to control noxious weeds, it frequently is much more economical to meet the weed problems through planned farming methods especially suited to the situation. Often such a program can fit into the regular operations and thus add but little additional cost. Wilson, Larson, and Stahler (*Minn. Farm and Home Science 2:* 4-5, 1945) found that field bindweed (*Convolvulus arvensis* L.) could be eradicated through the use of competitive field crops.

The research conducted at the Lamberton Minnesota Weed Station proved that bindweed could be eliminated while producing crops each year. A duckfoot cultivator was operated at a depth of about five inches so as to cut the weed plants off low enough to give maximum delay to their recovery and thus permit more time for a newly seeded crop to become established ahead of the weeds. The number of cultivations was reduced by permitting the weeds to grow at least two weeks after emergence. This growth hastened the destruction of the bindweed since it was depleting its organic reserves in making new growth.

Of the several plans followed, the most practical and successful was to cultivate the area at intervals of two weeks until about July 1 when soybeans, sorghum, or sudan grass were seeded at a heavy rate. After seeding, a cultipacker was used to stimulate rapid germination. The crop was harvested for hay as late in the fall as possible. The treatments were continued over a period of three years, requiring a total of 14 duckfoot cultivations. For the three years, the sorghum produced a total of 13.2 tons of air-dry forage with the sudan grass and soybeans a little lower but production enough to make them economically profitable. At the end of three years all field bindweed plants were eliminated, and the value of the feed produced had practically balanced the cost of the labor required for tillage.

The development of Sinox (sodium-dinitro-ortho-cresylate) as a selective spray has led to many worthwhile developments. Litzenberger, Post, and Bingham (Montant Agr. Exp. Sta. *Bul. 430,* 1945) outlined their results in the use of Sinox to control certain broad-leaved annual and biennial weeds.

For most broad-leaved weeds the application was one gallon of Sinox with two pounds of either ammonium sulphate, sodium bisulphate, or monobasic ammonium phosphate in 100 gallons of water applied at the rate of 80 to 100 gallons per acre. The lower rates are applied to the more susceptible crops as pear and flax. Weed plants were killed most effectively when they had developed three to seven leaves. The cost of spraying one acre was estimated at about $3.50 to $4.50.

No injurious effects to the soil resulted from treatment. Yield increases as great as 264 per cent were obtained on light to heavy weed infestations. Not only were yields increased, but the labor of harvest was reduced, and the grain contained less dockage and foreign material.

PLANT BREEDING

The layman often thinks of the scientist as being a cold-blooded individual who moves ahead in his research with little or no consideration for human welfare. Martin (*Jour. of Heredity 36:* 99-106, 1945) presents evidence to refute this belief in a paper entitled "Breeding Sorghums for Social Objectives." Martin presents several examples to support his thesis that there are social aspects of plant breeding. One of the most striking is the work of the plant breeder in the development of barley varieties without the rough, harsh beards that often made barley production so disagreeable. Although yields tend to be lower with the smooth awn types, yet they were developed for the comfort of the grower. He points out further that the development of the waxy types of sorghum has made it possible to produce a satisfactory substitute for tapioca during the war years when it was not available. Martin states that the new waxy sorghum, Cody, was increased until 32,000,000 pounds of grain were available in 1944. Today, the substitute tapioca is found on the shelves of most grocery stores, and reports from housewives indicate that the new product is meeting with ever increasing favor.

DIVISION XXIII

MEDICAL SCIENCES

MEDICINE, PATHOLOGY, AND PHYSIOLOGY

By Hamilton Southworth
Assistant Attending Physician, Presbyterian Hospital, New York

GENERAL

In the medical sciences the year 1945 is to be considered a war year. As in the two previous years, the majority of the younger physicians, those in the age group which is most productive in research, were serving in the armed forces. The contribution of these men approved for publication dealt largely with the problems of war medicine. Moreover, the investigative work carried out by civilian scientists in medical schools and teaching hospitals was largely stimulated and to a considerable extent financed by governmental agencies such as the Committee on Medical Research of the Office of Scientific Research and Development in Washington. Naturally such studies were designed to answer the specific demands of the armed forces.

A corollary of the military emphasis on research was the tendency to delay publication for reasons of security of new discoveries that might be of value to the enemy. In the English speaking countries a considerable body of new work thus accumulated, the results of which were known among more or less limited numbers of physicians and investigators, but the full details of which were not available to all. Following the termination of hostilities, most of the restrictions were lifted, but only a small portion of the accumulated material had appeared in the literature by the end of 1945. Most of the papers should appear in 1946.

ANTIBIOTIC THERAPY

If one had to characterize the year 1945 by its major interest, it would be best to group it with 1944 as the age of antibiotics. Assessments were made of the results from the widespread use of penicillin in war wounds, especially among Allied forces during the invasion of Normandy and the fighting along the German frontier. It was immediately apparent that the incidence of clinical wound infections was lower than in any other recorded campaign. It was also obvious that the captured German wounded, who had not had penicillin, had many more septic wounds. The temptation to hasty generalization was obvious, but it was equally apparent that the surgical handling of casualties was more expert than in previous wars and considerably better among the Allies than among the Germans. The triage and evacuation of casualties were also more skillful than in former comparable campaigns. Careful study revealed that the incidence of wound infection was dependent primarily on the speed and the adequacy of the surgery. It was generally concluded that penicillin played a contributory role and that, in the absence of proper surgery, it did little except possibly retard the spreading of infection into uninjured tissue. In the treatment of established infections, however, penicillin entirely lived up to its early promise and proved one of the most important factors in reducing the late mortality from wounds.

ORAL PENICILLIN

The great drawback of penicillin therapy has always been the necessity for parenteral injection. Moreover, the rapid excretion and degradation of the substance by the body has required that injections be repeated every two to four hours or be given by means of continuous infusion.

With the greater availability of penicillin, the possibility of oral administration using huge doses has been reinvestigated. Because of the known inactivation of penicillin at low pH values, preliminary studies were made in human volunteers who had previously received repeated doses of magnesium trisilicate in the hope of neutralizing gastric acidity. All subjects were kept in a fasting state, and serum concentrations of penicillin were determined periodically. It was found that, by means of oral dosage five times as great as that used intramuscularly, approximately equivalent serum levels were produced. Once the serum level was obtained, its die-away curve after oral and parenteral administration was approximately the same. It was found that the total urinary excretion during the first 12 hours averaged about 12 per cent of the ingested dose or roughly one fifth of the proportion excreted after parenteral administration. Since the concentrations found in the stools were negligible, it was presumed that the penicillin which was not absorbed was destroyed in the intestine, very likely by bacterial action.

In fasting volunteers who had received anti-acids, it was further discovered that the form in which penicillin was ingested made little difference. Serum concentrations were approximately the same whether the penicillin was given in water, in oil, or in oil and beeswax. Persons with achlorhydria maintained their levels somewhat longer than normal individuals. When the doses of penicillin were given after meals, it was found that the levels attained were considerably more variable and unpredictable. Under such circumstances, there was some evidence that a buffer of aluminum hydroxide gel increased and prolonged the absorbtion.

After oral administration of penicillin in fasting subjects, peak serum concentrations were usually attained in 30 minutes, whereas after meals the peak was generally not reached for two or three hours. It was assumed that absorption occurred maximally from the duodenum, though some might take place from the stomach itself. The only untoward effect encountered was slight discomfort associated with increased peristalsis.

These experimental studies with oral penicillin have been confirmed by clinical trials. A small number of cases of acute gonorrhea have been treated with 100,000 units orally every hour for from five to eight doses with results approximately as good as with the standard 100,000 to 200,000 units intramuscularly. Forty-five cases of pneumococcal pneumonia were treated orally with only one death and one serious complication, an emphysema. Dosages used were 750,000 units on the first day and 400,000 to 600,000 on subsequent days, usually given at two-hour intervals and without regard to the time of eating.

If the available supply of penicillin keeps up with the ever-increasing world demand, and technical improvements in production eventually lower the retail price below the present $1.50 per 100,000 units, oral administration will become the route of choice, because it is simple and painless and does not require trained personnel. For the time being, parenteral administration is preferred.

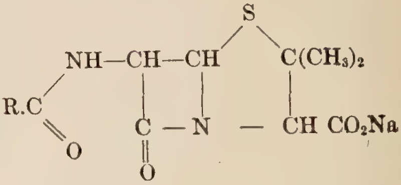
SLOW PENICILLIN

Studies of vehicles which will slow the absorption of parenterally administered penicillin have been actively pursued. The most promising of these is the mixture of beeswax and peanut oil first reported in 1944. The optimal concentration seems to be 300,000 units of calcium penicillin per cc. of a mixture containing 4.8 per cent beeswax. Preparation requires the purest materials and the greatest care, and the viscidity of the product is such that practice is usually required before injections can be successfully made. When, however, this "slow Penicillin" was given by subcutaneous injection in 300,000 unit doses, detectable serum levels were present for 24 hours in 64 per cent of the cases, and in 100 per cent of the cases for 16 hours. After 16 hours, 76 per cent showed levels of 0.1 unit per cubic centimeter or higher. Total urinary excretion in 24 hours was between 30 and 40 per cent. Reactions were negligible, the local soreness being little if any greater than after intramuscular injections of penicillin in saline.

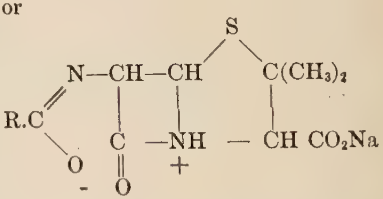
Clinical results with slow penicillin are as yet fragmentary. There is doubt as to whether levels persist long enough to permit of optimal results with one injection daily, which is the goal of out-patient care. It is, however, an effective way of reducing the number of injections.

THE CHEMISTRY OF PENICILLIN

During the war, concerted efforts were made by both university and commercial investigators to discover the chemical structure of penicillin. It was hoped that out of these studies a method of synthetic production might be found, which would be simpler and less expensive than the present cumbersome methods of mold culture and extraction. The coordination of this research in the United States was under the Office of Scientific Research and Development and in Britain under the Medical Research Council. Preliminary reports indicate that several penicillins exist, all having the empirical formula $C_9H_{11}O_4SN_2.R$ and differing only as regards the substituent, R. The penicillins are strong monobasic acids which, on treatment with hot dilute mineral acids, afford one molecule of CO_2, the amino acid, penicillamine (identified as d-B,B-dimethylcysteine), and other products. Further studies show (1) that the acidic group in penicillin is identical with the carboxyl group in penicillamine, (2) that by the addition of water a second carboxyl is produced, and (3) that it is this new carboxyl which breaks down by the action of hot dilute mineral acids. The dicarboxylic acid produced by hydrolysis is termed penicilloic acid, and synthetic studies have shown it is a thiazolidine. When penicillins are held in dilute mineral acid solution at about 30°, isomerides, called penillic acids, are formed which can be converted into penillamines. The structures of the penillic acids and the penillamines have been determined. The prevailing opinions arising from this and other work are that the structural formula of penicillin is either



or



There is no indication that successful synthesis of any of the penicillins has been accomplished.

STREPTOMYCIN

In 1944 a new antibiotic was described which was obtained from Actinomyces griseus and given the name of streptomycin. It was shown to have an anti-bacterial action not only against many gram positive organisms but also against numerous gram negative ones. The tubercle bacillus was one of those that proved sensitive. These *in vitro* results were subsequently confirmed in experimental animals, and it was established that tuberculosis in guinea pigs was more sensitive to streptomycin than to any of the sulfone drugs, which had previously been the most active therapeutic agents in this infection.

The human pharmacology of streptomycin has been investigated, using bio assay by the cup plate or other related methods for quantitative determinations. Preparations have been manufactured that contain as much as 500 S units per mg. When such products were administered orally, no serum level was detectable at any time. Most of the compound was recovered in the feces. Incubation of streptomycin in normal gastric juice showed that no inactivation occurred at the end of three hours. It, therefore, appeared that the material was not destroyed but was poorly absorbed from the gastrointestinal tract. After intravenous injection, only very small amounts of the compound were found in the feces but nearly 60 per cent of the dose was detected in the urine. Serum levels were better maintained than was the case with penicillin, and renal excretion continued for a longer period. Studies of various body fluids indicated that streptomycin passed fairly readily into the pleural and peritoneal fluid, but that only minute amounts could be found in cerebrospinal fluid. The material was concentrated in the bile, where levels two to three times that in the blood have been found.

Early preparations of streptomycin often caused headache, flushing, and urticaria. With more purified batches, these reactions have been negligible, and the available evidence indicates that these histamine-like effects were owing to an impurity. It is, however, generally recommended that administration be by the intramuscular rather than the intravenous route. Febrile reactions and mild arthralgia are also generally attributed to impurities, but a few instances of apparent sensitization to streptomycin have been recorded. Therapeutic doses as high as 4,000,000 S units daily in divided doses have been given for weeks at a time without deleterious effects. Under controlled conditions, no significant changes in liver or renal function tests or in the hematological picture have accompanied routine dosage. Up to 20,000 units have been given intrathecally with impunity.

Clinical results with streptomycin are as yet fragmentary. Rather dramatic success has been reported in a few cases of influenzal meningitis and in a small series of tularemia infections. Gram negative and mixed urinary tract infections that proved resistant to sulfonamides have responded favorably. Results in typhoid have in general been disappointing. In tuberculosis the picture is not yet clear. Preliminary reports indicate that, though there is no dramatic effect, some active cases appear to become arrested and then to progress towards healing under prolonged administration in a way to suggest a limited suppressive effect. Chronic pulmonary infections seem little influenced.

Streptomycin is still in the experimental stage but it is the most promising antibiotic for gram-negative infections. With proper purification it can be safely administered in large quantities.

INFECTIOUS HEPATITIS

Hepatitis has long been known as a disease of military campaigns. In the Second World War, it was a significant military problem, especially in the North African and Italian campaigns. The clinical experiences of this theater furnish the best descriptions of the disease on record. The importance of the prodromal stage, which may precede icterus for from three days to three weeks, was stressed. The cephalin flocculation and the sulfobromophthalein dye retention were shown to be the most reliable liver function tests in this condition, and the value of the high protein as well as high carbohydrate diet in therapy was conclusively established. Perhaps most important of all was the demonstration of the necessity for bed rest as long as active hepatitis continued. Cases allowed up prematurely developed enlargement and tenderness of the liver with a recurrence of symptoms. The routine was, therefore, established of observing all convalescent cases most carefully as they got up, and of giving them an exercise tolerance test before returning them to duty.

The existence of a long-suspected variant of the disease, Infectious Hepatitis without Jaundice, was also established. These cases are generally milder and, not having icterus, are often overlooked. Their liver function tests, however, show similar abnormalities, and if they do not receive proper care they are equally prone to go on to a stage of chronic activity. Chronic hepatitis is an occasional sequel of improper care, particularly of the failure to obtain adequate bed rest, and may last for several months. The recurrence of liver tenderness on exertion is reported to be the best criterion of definite activity.

Cases of jaundice in the armed forces included not only Infectious Hepatitis but also Serum Jaundice, a condition originally described as following the administration of human serum. The great outbreak of jaundice in the U. S. armed forces that followed the use of the original serum containing yellow fever vaccine in 1941 and 1942, was of this type. After the invasion of France, it was noted that battle-casualties resuscitated by means of plasma or whole blood occasionally developed jaundice some 60 to 120 days later. Most of the cases were mild and impossible to differentiate clinically from Infectious Hepatitis, but a few were very rapidly fatal.

No experimental animal that is susceptible to either Infectious Hepatitis or Serum Jaundice has been found. Transmission experiments have, therefore, required the use of human volunteers. (Most of the American work was carried out under the sponsorship of the Board for the Control of Influenza and Other Epidemic Diseases of the Surgeon General's Office, U. S. Army). It has thus been shown that the agent of serum jaundice is filter passing, resists heating to 56°C for one hour, and remains viable for months in human blood products. It has never been consistently transmitted from one human to another except by the injection of blood products. It has an incubation period of 60 to 120 days, and an attack does not produce immunity to subsequent infection with Infectious Hepatitis. The agent of Infectious Hepatitis is also filter passing and is similarly resistant to heat. On the other hand, persons with Infectious Hepatitis carry the agent in the stool and sometimes briefly in the nasopharynx. Oral ingestion of the agent produces the disease in susceptibles. The incubation period varies from 20 to 30 days, and one attack generally confers immunity.

Successful prophylaxis against Infectious Hepatitis has been secured by the administration of human gamma globulin. This material is obtained by the fractionation of human blood plasma and represents the fraction containing the majority of the antibodies. It was observed that children given gamma globulin for the prophylaxis of measles did not develop serum jaundice, while those given human convalescent serum at times became icteric. Since pooled human serum occasionally contains an icterogenic agent, this observation suggested that the immune bodies of other donors might be so concentrated in the gamma globulin fraction as not only to destroy any agent present, but also to supply an excess of antibody. An opportunity to test this theory was supplied by an outbreak of Infectious Hepatitis in a children's camp in Pennsylvania, and it was shown that only 20.8 per cent of the children given an injection of gamma globulin developed jaundice, as against 67 per cent of the controls. Comparable results were obtained in two Army trials in the Mediterranean theater, and a recent report suggests that similar benefit may be obtained by the injection of gamma globulin in battle casualties who have been transfused and may, therefore, be in the incubation period of Serum Jaundice.

MALARIA RESEARCH

Extensive programs of research into the problems of malaria were carried out both in England and the United States during the war. One of the early problems investigated was the optimal use of atabrine, for the advance of the Japanese into the south Pacific in the winter of 1941-1942 cut off the Allies from their main source of quinine. Atabrine was at first considered the best available substitute for quinine, but as its properties were further appreciated, it was found to be actually superior to quinine under nearly all circumstances. Since it is probable that atabrine, or a similarly acting compound, will largely replace quinine in malaria therapy, the war's accumulated experience concerning its toxicity is of extreme importance. Gastrointestinal symptoms were found to be the commonest manifestation of intolerance, but it was soon established that a program of divided doses rendered them unimportant in all but the occasional, truly sensitive individual. In the southwest Pacific, however, it was found that a certain number of persons exposed to extreme tropical conditions developed skin trouble after a few weeks of the daily dosage of atabrine used as a suppressive for malaria. The skin lesions were named "atypical lichen planus," and consisted of violaceous, lichenoid, or eczematoid lesions, which tended to occur on the dorsum of the hands and feet, the face, neck, forearms, and legs. Some were explosively eczematoid, others more chronic and lichenoid. All healed slowly, were at times increased by exposure to sunlight, and were occasionally accompanied by exfoliative dermatitis, agranulocytosis, or aplastic anemia.

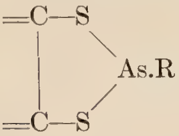
Large therapeutic doses of atabrine may be responsible for toxic delirium, and psychological disturbances have been reported in association with the usual suppressive doses. It is probable, however, that the latter represent the establishment of predetermined patterns in susceptible individuals. The occurrence of these dermatological and possible psychologic disturbances in association with atabrine makes it advisable not to take more than 0.7 gm. of the compound per week as a suppressive, or 2.8 gm. as a curative measure.

In the attempt to find an antimalarial drug more effective or less toxic than atabrine, over 14,000 compounds have been tested in various avian malaria infections under the direction of the Board for the Coordination of Malarial Studies. Compounds showing promise of activity were subjected to toxicological and pharmacological studies in laboratory animals. The results were quantitated, and some 80 of the most promising compounds were tried out in human malaria. Among the few that were shown to be superior to atabrine, were several 4-aminoquinolines. Of these, SN 7618 (7-chloro-4-(4-diethylamino-1-methylbutylamino) quinoline) has received the most extensive trial. It has been shown to be an effective suppressive when administered no more frequently than once a week in a well-tolerated dose. It will quickly terminate a clinical attack of *vivax* malaria and will cure *falciparum* malaria when administered for but one or two days. It is white and, therefore, does not color the skin, and the disagreeable gastrointestinal symptoms sometimes seen with atabrine do not occur. Several related compounds also show promise and require further investigation.

Studies of the 8-aminoquinolines have also been extensively pursued, and the old observation that Plasmochin in toxic doses has a definite curative action on *vivax* malaria has been confirmed, but so far no way of adequately avoiding the toxicity of such compounds has been reported.

BAL FOR TREATMENT OF ARSENIC POISONING

An important discovery resulting from wartime research in the means of protection against chemical warfare agents is the finding of BAL or British Anti-Lewisite. The activity of this dithiol compound in combining with Lewisite and Lewisite oxide was first demonstrated in England, and further applications were developed by joint Anglo-American endeavors. It was found that arsenicals strongly inhibited the pyruvate oxidase system, which was dependent on —SH groups for its activity. From this and other evidence, it became apparent that the toxicity of trivalent arsenicals was largely owing to their binding of essential thiol groups in enzyme proteins. The action of BAL was to compete successfully for the arsenic by means of its dithiol group to form compounds of the type



It was found, for instance, that if trypanosomes were subjected to lethal concentrations of arsenic, they lost all motility and began to show degenerative changes. The prompt addition of BAL resulted in their regaining motility and a normal cytological appearance.

BAL is itself moderately toxic. Large doses in animals cause salivation, vomiting, convulsions, and death. On the human skin, erythema and edema are produced, but put up in a sterile, benzyl benzoate-peanut oil solution, doses of 3 mgm. per kg. are well tolerated. For skin application, 5-10 per cent ointments were found effective. If lewisite was introduced into a rabbit's eye in an amount sufficient to destroy it, the installation of 5 or 10 per cent BAL up to five minutes after contamination led to almost complete recovery.

The development of a safe method of administering BAL parenterally made it possible to test it in arsenic poisoning resulting from antiluetic therapy or industrial exposure. Over 200 cases have now been treated, in general, with most beneficial results. The renal excretion of arsenic is increased, and toxic manifestations such as dermatitis and hemorrhagic encephalitis have improved.

It has been found that other heavy metals, such as Pb, Sb, V, Bi, Cd, Hg and Zn, inhibit tissue enzymes by combining with —SH groups. Enzymatic reactivation may be achieved by using certain BAL derivatives. The only clinical application of this work has been the use of BAL with encouraging results in a few cases of mercury poisoning. Useful application in other types of heavy metal poisoning may, however, be anticipated.

FOLIC ACID

For several years a number of closely related factors have been described which seem to be important for bacterial growth and for the prevention of anemia in certain animals. These have been designated the Lactobacillus casei factor, Streptococcus lactis R, the chick antianemic factor, vitamin B_c, vitamin M, and folic acid. It is now felt that these compounds belong to the vitamin B complex, that some are probably precursors of others, and that their essential activity can be expressed in terms of folic acid.

The antianemic action of this group of factors in the chick and the monkey led to their trial therapeutically in obscure human anemias. A synthetic crystalline preparation of folic acid has been prepared. Administration of small amounts of this material by mouth was initially reported as without effect on pernicious anemia. Subsequently, however, a number of cases of macrocytic anemias suggesting pernicious anemia were treated with large doses with marked benefit. Meanwhile, the similarity of human sprue to experimental Vitamin M deficiency in monkeys suggested a trial of folic acid. Parenteral administration of a few milligrams of folic acid has led to dramatic improvement in a few cases of sprue. It is apparent that in this new compound has been discovered an agent of value for at least some of the macrocytic anemias.

MODE OF ACTION OF INSULIN

It has been known for years that insulin was necessary for the proper utilization of glucose by animal tissues. Biochemists, however, have not been able to find a place where insulin might be required in the series of biochemical reactions which comprise the glycolytic cycle. It has now been reported that anterior pituitary extract (APE) inhibits the first step in the utilization of glucose, and that this inhibition can be counteracted by the addition of insulin. The reaction in question is Glucose + Adenosine Triphosphate → Glucose —6 phosphate + Adenosine Diphosphate. This step occurs whether glucose is being oxidized or being formed into glycogen, and it is catalyzed by hexokinase. Both *in vitro* and *in vivo,* it has been shown that APE inhibits hexokinase, and that insulin, by releasing this inhibition, allows normal phosphorylation. It has been further demonstrated (1) that insulin does not enhance the activity of uninhibited hexokinase, (2) that the conversion of glycogen into lactic acid is not influenced by APE, and (3) that rats made diabetic by alloxan yield tissue extract with the same hexokinase activity curves as those of rats previously injected with APE. The probable importance of these observations in explaining the mechanism of diabetes is obvious.

SURGERY

By Edwin J. Pulaski*
Halloran General Hospital, Staten Island, New York

Some of the highlights in surgery during 1945 are presented here. They include contributions from military surgery and from civilian experiences, as well as from researches in the broader fields of the basic sciences, by men closely associated with clinical work and the laboratory.

EARLY POSTOPERATIVE AMBULATION

Early ambulation, after operation, has been practiced for many years in certain hospitals in the aged, but only in recent years has it been applied to other patients. One of the reasons for interest in this method of handling patients is the stress of an increasing demand for hospital and nursing care, in the face of a shortage of both facilities at the close of the war. Another reason is that the use of non-absorbable suture material has been found to result in little or no lag-period in wound healing. It appears that fine steel wire, nylon, cotton, and silk cause so little reaction in sutured tissues that there is less evidence of the "weak stage" of the suture lines that occurs when catgut is used.

After surgical operations, particularly those in the pelvis and in the abdomen, venous return from the limbs is delayed, particularly in the aged and in the obese. While early rising of the patient has not significantly decreased postoperative thrombophlebitis, other circulatory disturbances are minimized and the incidence of chest complications is lowered. Other advantages of early walking have been suggested as follows: improved gastrointestinal function, with lessened incidence of abdominal distention; improved muscular strength and joint function, which lead to a more rapid resumption of full activity; improvement in morale; and economy in hospital beds and nursing care, and in the cost of illness to the patient. On the other side of the picture is the danger of increased wound infection and hernia-in-scar formation. It appears from these studies that in many instances the resumption of ambulation after operation can be hastened, in selected cases. Some of the advantages of early rising can be applied to patients not suitable for the program by giving leg and arm exercises in bed.

---

* Now on active service, Army of the United States.

CURARE IN ANESTHESIA

This South American Indian arrow poison, known since 1595, has been transformed into an anesthetists' tool. Curare action results in paralysis owing to interruption of the neuromuscular mechanism. Pharmacologists recently revived interest in this ancient drug, and now, finally a purified extract of curare is available, which exhibits true curare action without toxic side effects. This substance has a selective action, affecting first the muscles of the throat and neck, then the skeletal muscles of the extremities, the chest and the abdomen. It does not affect the heart.

This new curare was first employed in psychiatric patients, to soften the traumatic effects of convulsive metrazol and electric shock therapy. It has been used already in large series of patients without harmful effect. Next, it was tried on patients undergoing abdominal operations under cyclopropane-gas anesthesia. Curare works remarkably well in combination with cyclopropane to produce increased muscular relaxation. The chief advantage in curare lies in the fact that its use permits the employment of relatively non-toxic and readily controlled anesthetics and technics, for example, cyclopropane-gas. Overdosage may produce respiratory paralysis, and the drug must be used only by qualified expert anesthesiologists.

ALCOHOL

Interest has been revived in the use of intravenous alcohol in the surgical patient. Recommended in 1929 as an anesthetic agent, the popularity of alcohol was curtailed because of certain undesirable side reactions and complications. Various scientists renewed their interest in recent times in intravenous alcohol from the analgesic and caloric standpoint, and in the past year several papers appeared advocating its use. The Russians employed intravenous alcohol in 5 per cent glucose solution, in evacuation hospitals at the front, for the analgesic effect.

Alcohol, in surgical patients in this country, has been found to possess several advantages: (1) five per cent and 10 per cent alcohol intravenously increases the caloric intake and has special value in those cases with inanition; (2) it is a potent sedative and analgesic, and can be substituted for the opiates and other forms of sedation; (3) sedation is not attended with depressed respiration; (4) it may be used in cardiac patients with relative safety because of its vasodilatory effect and minimal effect on the blood pressure; (5) it has a definite place in regional anesthesia as a supplement during the operative procedure; (6) it has proved its value in alcoholic patients who can not be controlled with the usual doses of narcotics; and (7) the only complications noted are occasional transitory headaches, nausea and vomiting, and albumin in the urine, which disappears in a day or two. One additional virtue of alcohol narcosis is that it is inexpensive.

BLOOD AND BLOOD SUBSTITUTES

With particular reference to proteins, much has been accomplished in recent times in the study and treatment of nutritional deficiencies, particularly vitamin and protein deficiencies. The vitamin deficiencies were touched on in this series in 1943, and mention was made in the 1944 review of the problem of protein deficiencies in certain surgical conditions.

The correction of protein deficiencies is important in shock, in edema owing to low proteins, in wound healing, in immunity to infections, and in detoxification of poisonous substances. The methods of treatment now include the use of whole blood plasma and albumin for acute deficiencies, such as hemorrhagic shock; and protein hydrolysates, concentrates, and diets for the less acute, and for chronic conditions.

The war afforded ample opportunity to evaluate the usage of plasma infusions, in wounded and injured men. It was realized, after some experience with plasma, that it was not a physiological substitute for whole blood in the management of the wounded, but only a substitute for the purpose of restoring and maintaining blood volume until whole blood transfusions could be started. Plasma has come to be looked upon, therefore, only as a first aid measure for acute surgical measures, but not as a substitute for whole blood.

Specific indications for its use are found in the management of burns and in a few other conditions in which only the plasma is lost in the circulation. Dried plasma costs approximately one dollar per gram. The treatment, therefore, is expensive, and experience points to shifting to other and less expensive forms of proteins as soon as the emergency has ceased to exist. Intravenous protein hydrolysate feeding has been made possible by the recent development of solutions of pure amino acids. These are prepared by the acid hydrolysis of casein or enzymatic hydrolysis of casein. Five per cent solutions of glucose are administered with them. These protein hydrolysates for intravenous use represent a considerably more economic source of nitrogen than plasma.

Oral feedings are used to correct protein losses or other deficiencies whenever possible. Protein in the form of a digestive is now available for oral use, and several preparations of merit are being marketed. In their present forms, these digestives are not too palatable and must be given well disguised in milk chocolate and the like, or by intubation. Wherever possible, the best means to correct protein deficiencies is by high protein diet. Predigested protein is an adjuvant to such a diet only.

ADVANCES IN CHEMOTHERAPY

Advances in chemotherapy have had a far reaching effect on surgery. With the advent of the sulfonamides, then of penicillin, and now of other chemotherapeutic agents, one can not help being impressed by the radically altered outlook for patients with septicemia, meningitis, peritonitis, and pneumonia. Sulfadiazine continues to be the drug of choice for meningitis, principally because of its ready diffusion into the meninges, but it is becoming a common practice to combine it with penicillin in these serious infections.

PENICILLIN THERAPY

The ability of penicillin to deal with invasive staphylococcal and streptococcal infections has been amply demonstrated. Its use has in no way lessened the importance of other surgical measures, such as drainage of pus and removal of dead tissue, but in many instances, such as in the treatment of furuncles, it has minimized the extent of the surgery needed. Penicillin in war wounds has limited the spread of infection from the area of infliction, and has been a factor in reducing the number of deaths from sepsis. Aided and abetted by surgery, it has shortened the course, and helped to eradicate, local infections, when the organisms have been susceptible. It has been valuable in checking the spread of certain anaerobic infections, such as gas gangrene, but the evidence is still inconclusive as to how important a role penicillin does play. In tetanus, penicillin has not been outstandingly successful, and the use of antitoxin, together with appropriate surgical measures is still the most important treatment. Penicillin by nebulization seems to be of value in certain suppurative infections of the lung and in pre-operative preparations of patients for lobectomy.

The need for frequent injections in penicillin therapy has stimulated the search for other means of administering the drug. The repetition of three hourly injections often becomes a serious matter to the sick, weary, and nervous patient, interfering with sleep and sometimes going on to an obsession about needles. A number of solutions to this problem have been suggested, and some of them are already showing promise. The use of calcium penicillin in a beeswax-and-peanut oil emulsion has been shown to give effective levels of the drug for 24 hours following a single intramuscular injection. This single injection technic has already been found effective in the treatment of gonococcal urethritis, and its use probably will be extended to the treatment of other infections. Another approach has been the attempt to administer penicillin by mouth. The problem of penicillin destruction by gastric acidity has been met in part by the neutralization beforehand of the gastric secretions by the administration of alkalies. This approach has two disadvantages, unpredictable rate of absorbtion and destruction of some of the penicillin, since approximately three times the amount usually given by injection are needed to achieve therapeutic levels. The oral method of administration, if perfected, will be a boon to the patient, and to the busy physician.

Penicillin performs most dramatically in pure infections by sensitive organisms in which the blood supply to the infected area is adequate, and where there is no need for surgery. It is the most valuable chemotherapeutic adjuvant to surgery where the organisms are susceptible and easily approached. Most recent experiences, however, indicate that penicillin is of questionable benefit in the treatment of many infections in which there is a mixture of organisms. Gram-positive and gram-negative polymicrobic mixtures, acting in synergism or symbiosis, are able to multiply in the presence of dead tissue. In so doing they may produce local and/or systemic toxic effects. In addition, the products of their metabolism have the power of destroying penicillin; in fact, the inhibitors of penicillin are produced chiefly by bacteria. There are many different species which have the power of destroying penicillin, but the most numerous belong to the gram-negative non-sporulating rods, notably the Escherichia, Proteus, Pseudomonas, and Aerobacter groups. Many species in these groups destroy penicillin only to a certain degree, but unless very large doses are given, the antagonistic, destructive effect may be sufficient for the production and propagation of penicillin resistant species rather than the selective elimination of penicillin sensitive strains. Most chronic established infections are polymicrobic in character, and gram-negative bacteria are commonly present. They dominate the picture in retroperitoneal, peritoneal, lower extremity, and lung abscess infections. In addition, most gram-negative infections, such as those related to the colon, typhoid, Salmonella, Kleibsiella and Brucella groups, remain quite refractory to chemotherapeutic agents available heretofore.

STREPTOMYCIN

Streptomycin, an antibiotic agent produced by certain strains of Streptomyces griseus, first reported in 1944, is the result of an extensive search for an antibiotic agent that would be active against gram-negative bacteria and mycobacteria, be nontoxic to animals and be efficacious in vivo. It is produced from cultures of Streptomyces griseus by a series of extractions and purifications, and the pure crystalline base possesses an activity of about one unit per microgram. Streptomycin is active in vitro against gram-negative as well as certain gram-positive bacteria. It also exerts a marked bacteriostatic and bactericidal effect upon Mycobacterium tuberculosis, especially the human strains. It is not active against fungi.

Animal inoculation studies have established that the toxicity of Streptomycin is extremely low. Some lots produce an unfavorable histamine-like effect, but this seems to be owing to an impurity which probably will be eradicated with further experience in production. In vivo, Streptomycin has successfully controlled experimental infections owing to Salmonella schottmulleri, Pseudomonas aeruginosa, Proteus vulgaris, Shigella gallinarum, Brucella abortus, Klebsiella pneumoniae, Pasteurella tularensis, and Mycobacterium tuberculosis. Against the gram-positive Diplococcus pneumoniae and Staphylococcus aureus, protection was afforded by somewhat larger doses. Streptomycin has also protected against spirochaetal infections caused by Borrelia novyi and Leptospira icterohaemorrhagiae. It is not effective in suppressing avian malaria or in the control of the few virus diseases tried.

In human beings, Streptomycin is rapidly absorbed and excreted in the urine following parenteral administration. It is not absorbed appreciably from the intestine, nor is it destroyed there; in the gut it exerts a marked suppressive effect upon the microbial population. Therapeutic blood and urine levels are readily established and maintained, by intramuscular or intravenous injection. By the oral route of administration, Streptomycin does not readily enter the blood stream. Following the oral or parenteral administration of Streptomycin, no unfavorable effects have been encountered which could not be attributed largely to the presence of impurities in the preparations used.

To date, Streptomycin has been administered for infections of the urinary tract, typhoid, brucellosis, Klebsiella infections, tularemia, tuberculosis, and wounds. Although the results in some cases have been very encouraging, in others, such as brucellosis and tuberculosis, no definite conclusion may as yet be drawn. In view of the limited clinical data, a final evaluation of the therapeutic potentialities of Streptomycin is impossible at the present time.

FLUORESCEIN AS A DIAGNOSTIC AID

Fluorescein stain has been used over a period of a great many years in the eye to aid in detecting damage to the cornea when the eye has been accidentally injured. A year ago this dye found a new use. Given intravenously to patients with thermal burns of the body surface, the dye diffuses readily; and when the patients are viewed under ultraviolet light with a Wood's filter, the third degree burns appear to be black, while the second degree burns take on a yellowish green hue. This allows a more accurate diagnosis of burns and serves as a guide to later therapy. The use of Fluorescein has now been extended to determine the viability of strangulated intestine. The dye is given intravenously, and an ultraviolet light with a Wood's filter is employed to determine Fluorescein in the damaged bowel. The presence of Fluorescein usually is sufficient evidence of viability and permits return of damage loops of bowel to the abdominal cavity. The absence of Fluorescein is diagnostic of non-viability. This has been confirmed by microscopic sections. The evidence is accumulating that this relatively simple method removes the uncertainty from a diagnosis which heretofore has not been classified as exact.

THIOURACIL AND THYROTOXICOSIS

In the previous review (1944) the introduction of Thiouracil in the treatment of thyrotoxicosis was mentioned, and the early reports indicated that the drug showed promise in the preparation of the hyperthyroid patient for operation. Experience in the past year has brought additional support to the preliminary conclusions. One-stage thyroidectomy may be performed with minimal risk in a patient with severe hyperthyroidism, who has been adequately treated with thiouracil. Adequate preparation reduces the mortality rate and shortens hospital convalescence to seven or ten days. As thiouracil is toxic to about 11 per cent of patients, the greatest potential danger being granulocytopenia, frequent blood examinations and careful observation during the preparatory period are imperative. Doses of 0.2 gm. of thiouracil are given at 7 A.M., 2 P.M. and 9 P.M. daily until all hyperthyroid manifestations subside and the basal metabolism rate is normal. Approximately one day of treatment is necessary for each percentage point of elevation in the basal metabolism rate. Thiouracil is withdrawn the last week before operation. Surgeons experienced in its use now administer iodine (Lugol's solution) during the final three pre-operative weeks. This eliminates the difficulty of increased vascularity and friability which are the result of thiouracil administration without iodine.

WAR SURGERY

The war brought about progress and improvement in the management of the wounded patient and of the various types of war wounds. The problem of shock is now better understood, and the therapeutic value of whole blood and plasma in addition to recognized principles is generally appreciated (see, Blood and Blood Substitutes, *supra*). As concerns wound management, four well defined principles were early recognized and generally accepted. The first of these is the provision of adequate exposure of all of the wound by adequate incision. Second in importance is the removal of all devitalized tissue in the wound. The third principle upon which there is complete agreement is drainage, *i.e.*, leaving all war wounds open. The fourth and final principle is immobilization. Thus the experience in the war established well the dictum that wounds should be left open after their initial debridement. While this rule has been justified against infection, the inevitable consequence has been protracted convalescence and the formation of excessive scar tissue. Efforts to obviate these disadvantages have led to the development of a plan of wound management which constitutes, through its extensive application, a significant advance in military surgery.

This plan is based upon a concept of wound management that provides the early routine closure by suture of wounds left unsutured at the initial operation. The usual routine consists of complete initial operation with adjuvant chemotherapy, penicillin or the sulfonamides, and closure of the wound by suture usually at the time of the first dressing on or after the fourth day. The proper time for secondary closure by suture is determined by the gross appearance of the wound. If there is evidence of slight infection, appropriate measures are taken to clean up the wound prior to instituting a secondary closure, usually a few days later. If established infection is severe, the patient is given a course of specific and general support of therapy followed by surgical revision of the wound and staged closure. This practice has led to good healing in 90 to 95 per cent of thousands of the soft part wounds encountered under battle conditions. Healing has been accelerated, restoration of function hastened, and ultimate disability and deformity minimized by this plan of wound management. The plan in its final stage embraces reconstructive surgery, which now is being accomplished earlier than possible before.

In *neurosurgery*, a distinct advance was made during the war in the subsequent repair of skull defects with the use of tantalum plate. The most approved method of suturing nerves, at present, is with fine tantalum wire followed by wrapping the line of anastomosis with tantalum foil. The use of fibrin foam as a hemostatic agent, mentioned in the 1944 review, has been generally appreciated as a valuable aid in neurosurgical operative procedures. Probably the greatest advance in *thoracic surgery*, in this war, has been in the management of cases of massive clotting of blood in the pleural cavity, and of empyema. Massive clotting of blood in the pleural cavity occurs in about four to six per cent of cases with hemothorax, and is suspected when clinical findings persist after only small amounts of blood can be withdrawn, and serial roentgenograms show no improvement during the third to sixth weeks. Using penicillin therapy as an adjunct, early operation is done in these cases with removal of clots from the pleural cavity, and the dense layer of fibrin from the underlying lung, in order to permit rapid expansion of the lung and thus obliterate the cavity. Similarly, in post-traumatic empyema, if extensive collapse of the lung occurs early, surgical decortication is performed. The application of these surgical principles, and this shift of emphasis from local treatment of secondary pleural complications, to procurement of early and complete re-expansion of the lung, has provided a significant advance in the management of these serious injuries.

The local treatment of burns has finally resolved itself into the use of the pressure dressing applied over fine-mesh vaselined gauze. This pressure dressing method has proven eminently satisfactory in the Army. The use of a pressure dressing permits early skin grafting. This measure tends not only to check protein loss but converts large open wound surface on closed wounds. The systemic treatment has been clarified with particular emphasis on the large amounts of plasma needed to combat shock in the initial phase, and the employment of electrolytes to replace loss through exudation and the judicious use of chemotherapeutic agents to minimize or prevent infection.

STORAGE OF SKIN FOR AUTOGENOUS GRAFTS

Skin kept under refrigeration for as long as eight weeks may be used successfully for autogenous grafts. The procedure for the storage of the grafts is simple. The split thickness skin grafts are wrapped in gauze wrung out in saline solution and placed in a bottle on which an air-tight cap is screwed on. The bottle is placed in a refrigerator in which a temperature from 3 to 6°C. is maintained. The storage of skin grafts saves the patient with a large denuded area from a succession of operations, reduces the number of donor areas required in multiple-stage plastic repair of a healed wound, is particularly useful in the event of partial failure of an initial graft, and permits application of the graft at the optimum time as a bedside dressing.

THE PLASTIC CLOSURE OF BEDSORES (Decubiti)

Decubitus ulcers frequently do not heal because of associated malnutrition and other deficiencies, but even after anemia, reduced plasma protein, and avitaminosis have been corrected, a discouragingly long period is required before the lesion is filled in with granulation tissue. Pinch grafts over the denuded area tend to break down. A more effective treatment of large sacral bedsores, once the nutritional requirements have been supplied and the infection controlled, now comprises excision of the granulating area and plastic closure by means of sliding flaps. Sepsis in the tissues surrounding the ulcer and infection in the bladder or other foci is eradicated by systemic and local penicillin therapy. Penicillin is given before operation until a clean wound is obtained, and for a week or longer after operation. The entire ulcer area is exercised to normal surrounding tissue, and the top granulations from the ulcer base are cut away. The surrounding skin is undermined and the flaps are slid into place over the wound, then closed, without tension, with fine silk sutures. The patient does not lie on his back for a week after operation. After this period the sutures are removed, and in the majority of instances the wound remains healed. The advent of penicillin therapy has brought within the realm of surgery another manageable condition, previously difficult to treat.

PUBLIC HEALTH

By Ira V. Hiscock

Professor of Public Health, Yale University

TRENDS AND OPPORTUNITIES

Changing challenges are indicated by a review of problems and services. Such a review recently showed that between 1900 and 1940, for the U. S. Registration Area, the death rates for typhoid and diarrhea and for diphtheria and other acute communicable diseases were reduced more than 90 per cent; for tuberculosis, 77 per cent; for pneumonia and influenza, 61 per cent. The mortality from all other causes than those mentioned fell only 16 per cent; today 27 per cent of all deaths are owing to diseases of the heart, 16 per cent to other conditions associated with the cardio-vascular-renal complex, and 11 per cent to cancer.

The birth rate rose slowly and irregularly for a few years after 1933, until 1939, then more rapidly, by some 27 per cent, through 1943. A slight decline in this trend, the drop in 1944, marriages and experience of the First World War suggest a decline is likely until the return of an appreciable number of the military forces.

The health of the American people, as reflected by the mortality record of many millions of Industrial policy holders of the Metropolitan Life Insurance Company, and by other data, safely weathered the hardships and dislocations of the war period. Cancer and heart disease show a general increase. Tuberculosis turned upward in some areas, but for the country as a whole reached the lowest rate ever reported in the United States in 1944.

The Surgeon General of the Public Health Service notes that there is yet much to be done. Some 15,000,000 people in rural communities are without physicians and hospitals; there are some 1,200 counties without basic public health services; the construction of small, well-equipped hospitals and health centers to serve rural communities is a particularly urgent need. The improvement of working conditions and health conservation among industrial workers is of concern to public health workers as well as to labor and management. Today, 38 state industrial hygiene services, most of them in health departments, may be contrasted with only five ten years ago; but, for expansion, organized labor and management must realize the values and give wholehearted support. The Army, the Navy, the Public Health Service, and the War Shipping Administration used modern psychiatry to cope with emotional shocks of war; such services need extension in community and state health programs.

Looking ahead, "the health officer must not be solely interested in syphilis and tuberculosis, or even in heart disease and cancer. He must, more and more, concern himself with nutrition in its subtle and complex influences upon vigor and efficiency and satisfaction. The absence of vitamins or iodine or fluorine in the diet of a community may seem as important as the presence of typhoid bacilli in its milk supply. He must concern himself with housing . . . with the living wage and with the provision of a due measure of social security, which is essential to both physiological and psychological health. . . . In other words, public health which in its earliest days was an engineering science and has now become also a medical science must expand until it is in addition a social science." (*Amer. J. P. H.,* Vol. 35, No. 3, March 1945, pp. 191-198, C.-E. A. Winslow, "Changing Challenges of Public Health"; *P. H. Reports,* Vol. 60, No. 17, April 27, 1945, Thomas Parran, "Over the Horizon in Public Health"; *Statistical Bul. Metropolitan Life Ins. Co.,* Vol. 26, No. 10, October 1945, pp. 1-3; *Amer. J. P. H.* Vol. 35, No. 4, April 1945, pp. 315-325, "Trends of the Birth Rate," Louis I. Dublin and A. W. Hedrich.)

AMENDED INTERNATIONAL SANITARY CONVENTIONS

The world conflict added to the danger of the spread of great pestilences by interfering with the effective administration of the existing international sanitary conventions. With this situation in mind, the Council of UNRRA, at its first session recommended that "governments and recognized national authorities cooperate fully with the Administration in establishing at the earliest possible date regional and other emergency agreements and arrangements for the notification within limits of military security, of diseases likely to become epidemic, uniformity in quarantine regulations, and for other measures of prevention." On Jan. 5, 1945, there were signed in Washington two sanitary conventions concerning maritime and aerial travel, amending the International Sanitary Convention signed at Paris in 1926 and the International Sanitary Convention for Aerial Navigation signed at The Hague on April

12, 1933. These Conventions, which came into force on Jan. 15, 1945, were framed in the light of the most recent advances in medical science and public health practice. (UNRRA Health Division, *Epidemiological Information Bulletin,* Jan. 15, 1945, Vol. 1, No. 1)

IMPORTATION OF DISEASE

While it is the consensus of experts in the field of tropical diseases that the risk of importation of these diseases into the United States is small, nevertheless, the Army is taking precautions to prevent their introduction. (*Amer. J. P. H.* Vol. 35, No. 6, June 1945, Lt. Col. Thomas G. Ward, "Control Measures Against Importation of Disease by Men Returning from Overseas Duty," pp. 572-574). For an authoritative report on measures in the control of communicable diseases, —official with the American Public Health Association, the U. S. Public Health Service, the U. S. Navy, and approved in principle by the Surgeon General, U. S. Army, see "The Control of Communicable Diseases" (*A.P.H.A.,* 1790 Broadway, N. Y., 1945, sixth ed., 149 pp.)

LEGISLATION

An unprecedented number of legislative proposals for the improvement and extension of existing health services and for establishment of medical care programs was introduced in Congress as well as in state legislatures in 1945.

The most important Congressional bills included the following: (1) the Hill-Burton bill (S. 191 and H.R. 2498) calling for construction of hospitals and related facilities at public expense, which was amended and favorably reported to the floor of the Senate on Oct. 27, 1945; (2) the Maternal and Child Welfare bill (S. 1318 and H.R. 3922, 3994, and 4059), proposing complete tax-supported health service, including medical care, for mothers during the maternity period and for children up to 21 years of age; (3) the National Institute of Dental Research bill (S. 190 and H.R. 3816) to promote research in dental diseases and conditions; (4) a bill for the development of dental health programs (S. 1099 and H.R. 3412, 3414); (5) the "National Neuro-psychiatric Institution" bill (S. 1160 and H.R. 2550) to promote research in mental diseases and conditions; (6) a bill to promote research in cancer and poliomyelitis (H.R. 3939); and (7) two Wagner-Murray-Dingell bills, one of May 24, 1945 (S. 1050 and H. R. 3293) and one of Oct. 29, 1945 (S. 1606 and H.R. 4730). The latter, introduced in connection with President Truman's message to Congress proposing a national health program (79th Congress, 1st Session, H.R., No. 380), would make provisions for the extension and improvement of selected community-wide health services (control of venereal diseases and tuberculosis, general public health services, maternal and child health services); for uniform medical care programs for the needy; and for introduction of "prepaid personal health service benefits" for the large majority of the American people. A Senate Joint Resolution on the formation of an international health organization was reported favorably out of committee (Sen. J. Resol. 89).

MEDICAL CARE

In January the Senate Subcommittee on Wartime Health and Education submitted a report describing unmet health needs and outlining a program designed to meet these needs (79th Congress, 2nd Session, Subcomm. Rep. No. 3).

Preparatory to the enactment of the hospital construction bill nearly half of the states had inventories of their hospital facilities under way or about to be started, and most of the others were in process of preparing surveys. The pilot survey in Michigan was nearing completion (American Hospital Association, Commission on Hospital Care, *Hospital Survey News Letter,* Sept. and Nov., 1945).

With the discharge of physicians and dentists from the Armed Services the shortage of professional personnel began to ease, but the lack of residential and office space prevented many physicians and dentists from taking up practice.

Requests for medical care at public expense continued to be received less frequently than in pre-war years, as a high degree of employment with ensuing increased family income and accumulated savings enabled many families to pay for their own care. Lately, however, an increase in applications for general assistance and medical care was observed in some of the larger cities.

Following the example of several other states, Maryland revised its medical care program for the needy. As of June 1, 1945 the State Department of Health has been made responsible for the administration of the services at the state level (Maryland State Dept. of Health, *Monthly Bulletin,* 16:43, July 1945).

The EMIC program was utilized by approximately 80 per cent of all eligible wives. Under this program more births were attended by physicians than in other population groups and considerably more births (nearly 90 per cent) took place in hospitals than is true for the population as a whole.

The medical care program for Veterans was reorganized. Considerable additional funds were provided by Congress for repair, improvement, and new construction of general, tuberculosis, and neuro-psychiatric hospitals and other facilities. Plans for cooperation between teaching institutions and Veterans' hospitals were in process of development *(J.A.M.A.* 129:1100-1102, Dec. 15, 1945).

The total expenditures of Federal, state, and local agencies for medical care of civilians in the fiscal year 1944-45 amounted to about $1,000,000,000. This figure includes capital expenditures for hospital construction as well as operating costs of services.

An analysis of public policy in providing, at public expense, facilities and services for the care of the sick, and a discussion of the problems of planning for medical care facilities, professional services, financing, and administration, are contained in a new book entitled *Public Medical Care* (Franz Goldmann, New York: Columbia Univ. Press, 1945, 226 pp., $2.75).

The Blue Cross plans, providing for hospitalization in return for prepayments, covered about 20,000,000 persons (American Hospital Association, Hospital Service Plan Commission, *Blue Cross Contract Guide,* Chicago, Nov. 1945).

Voluntary prepayment plans providing for surgical services for hospitalized persons or more complete medical care covered an estimated 4,000,000 to 5,000,000 persons. Coordination of such plans with Blue Cross Plans received growing attention (American Hospital Association, Hospital Service Plan Commission, *Non-Profit Medical Service Plans,* Chicago, Nov. 1945; Social Security Board, Prepayment Medical Care Organizations, Third Edition, 1945). The American Medical Association urged the development of voluntary rather than compulsory health insurance plans under the auspices of medical societies *(J. A. M. A.* 128:883, July 21, and 129:1207, Dec. 22, 1945).

ACCIDENTS

Recognizing the importance of accident prevention as an essential public health service, a committee of the American Public Health Association has outlined a plan for official health agencies with special reference to home accidents. Five state health organizations have active programs: New York, Minnesota, New Jersey, Illinois, and Kansas.

As a cause of death, accidents rank fifth in the United States, exceeded only by heart disease, cancer, cerebral hemorrhage, and nephritis. They are responsible for some 94,000 fatalities and an estimated 10,000,000 disabling injuries. Accidents in and about the home still take the lives of about 32,000 men, women, and children a year, and rank ninth among the causes of death. It is encouraging that leading organizations interested in home safety have taken steps to coordinate their efforts *(Amer. J. P. H.,* Vol. 35, No. 3, March, 1945, pp. 216-220; *Statistical Bul. Metropolitan Life Ins. Co.*, Vol. 26, No. 11, Nov. 1945, pp. 8-10).

HOUSING

A quantitative appraisal of substandard housing is a 1945 contribution of the Committee on the Hygiene of Housing of the American Public Health Association, providing a relatively simple and economical instrument, which can help in raising housing inspection to the level of scientific and effective administrative practice *(Amer. J. P. H.*, Vol. 35, No. 5, May 1945, pp. 511-513).

SCHOOL HEALTH

Health needs of school-age children and school health policies received considerable study in 1945 by many national agencies, and joint plans were formulated to improve conditions. One important step at the Federal level was the formation of a committee from the U. S. Office of Education, the Children's Bureau, and the Public Health Service, to plan cooperatively the activities of the Federal Government. For the state and local level, similar coordinating committees have been recommended. The National Committee on School Health Policies, formed in 1945 by the National Conference for Cooperation in Health Education, has prepared a constructive guide for all concerned with health in schools, integrating the viewpoints of many professional groups on the contributions which school programs can make to the health of children and communities (*School Life*, November 1945, "Health Needs of School-Age Children and Recommendations for Implementation," pp. 1-8; "Suggested School Health Policies—A Charter for School Health," Health Education Council, 10 Downing St., New York 14, p. 46, price 25 cents, October 1945).

GAMMA GLOBULIN FOR MEASLES

One of the great triumphs in public health has been the reduction of childhood diseases, especially diphtheria by immunization. The progress in practical immunization against measles has passed through stages, involving, successively, the use of convalescent serum, pooled normal adult serum, placental extract, and Fraction II of the gamma globulins which is 25 times as potent as plasma in its content of measles immune bodies. It has been shown that these gamma globulin antibodies are effective in the prevention or attenuation of measles, and their use "constitutes the safest and most effective agent available for the prophylaxis of measles" (Janeway). This material is now available to health officers. The American Red Cross made its stock of pooled human plasma available, and the commercial firms have provided the extracted gamma globulin at cost *(Amer. J. P. H.* Vol. 35, No. 7, July 1945, p. 732; *Science*, 101, 2612:51-56 Jan. 19, 1945; *J. A. M. A.*, 126, 11:674-680, Nov. 11, 1944).

AIR-BORNE INFECTION

The importance of the problem of atmospheric dissemination of disease germs (particularly viruses and certain bacteria) has been made clear by the Wellses and by Hart. The Wellses' work indicates a field of sanitary ventilation beyond the hospital (operating room and communicable disease ward) and strongly suggests that hazards in the school classroom may be sufficient to warrant also control measures. The use of either ultraviolet light or of aerosols may be efficient; the treatment of floors and furniture (or bedding) with absorptive materials has apparently proved of value in reducing atmospheric pollution (*Amer. J. P. H.* Vol. 35, No. 9, September 1945, James E. Perkins, "Evaluation of Methods to Control Airborne Infections," pp. 891-897; and Editorial, pp. 951-952).

PUBLIC HEALTH NURSING

For many years it has been recognized that a single generalized public health nursing service is the ultimate ideal for a community. Much progress has been made toward attainment of this goal in Honolulu and in several cities on the mainland. In many communities, the health department has contracted with the Visiting Nurse Association to perform certain routine duties (tuberculosis nursing in New Haven, child health nursing in Hartford, Conn., for example); in some cities (Dayton and Columbus, O., Oakland, Calif.) the health department and the V.N.A. formed a joint nursing staff; in some (New Orleans), the health department has taken over the fundamental bedside provision of bedside care in the home. In Seattle, the health department and the V.N.A. nursing services have been amalgamated (*Publ. Health Nurs.*, 37:294, June, 1945; *Amer. J. P. H.*, Vol. 35, No. 12, December 1945, pp. 1321-1333).

LOCAL HEALTH UNITS

A pattern has been prepared for the complete coverage of continental United States with reasonably adequate full-time local health units, which is in keeping with high editorial standards and does credit to the authors. This volume indicates how countrywide basic, minimum coverage can be secured through 1,200 local health units directed by full-time medical and public health trained administrative officers; each unit designed to serve a minimum of approximately 50,000 population (*Local Health Units for the Nation*—A Report by Haven Emerson, Chairman, Subcommittee on Local Health Units, Committee on Administrative Practice with the collaboration of Martha Luginbuhl, New York: The Commonwealth Fund, 1945, 333 pp., $1.25).

VOLUNTARY HEALTH AGENCIES

"The voluntary health movement has had its fullest flowering in the United States." These agencies have grown rapidly to number over 20,000, spending (exclusive of the Red Cross) some $50,000,000 a year, and enlisting support, as board and committee members, of 300,000 public-spirited citizens. A study of these agencies and of the problems involved has recently been completed with the support of a grant from the Rockefeller Foundation. A report of this inquiry, involving two years of field work, concludes that the voluntary health agencies represent a form of enterprise that is likely to have a permanent and valuable role in our civilization. Their functions are to survey needs and explore methods of meeting them, to demonstrate new promising procedures, to educate the public, to supplement the work of official agencies, to promote sound legislation, and to stimulate coordination. While finding much to praise, the authors point out gaps and weaknesses in a forceful manner, and urge that prompt attention be given to qualifications of board and staff members, to coordination of individual local agencies in order to further the health of the community as a whole, stressing the value of a health council, to periodic self-study and appraisals, pooling of fund-raising efforts, and to strengthening of the National Health Council (Gunn, Selskar M. and Platt, Philip S., *Voluntary Health Agencies: An Interpretive Study*, foreword by Louis I. Dublin, under the Auspices of the National Health Council, New York: The Ronald Press Company. $3.00).

DENTISTRY

By Houghton Holliday
School of Dental and Oral Surgery, Columbia University

The year 1945 in dentistry was replete with commendations to dental officers for meritorious service with the armed forces, with problems pertaining to readjusting the returning dentists to civilian practice, with changes in dental education and in the dental schools, with dento-social legislation and with clinical research, particularly in the field of chemotherapy.

POST-WAR PLANS OF DENTAL OFFICERS

In order to anticipate the needs of dental officers and to be able to assist them in returning to civilian practice, the War Service Committee of the American Dental Association conducted a survey among all dentists serving with the armed forces regarding their post-war plans. Replies were received from 7,549, or about one third. A summary of the data taken from the returned questionnaires provides pertinent information about the desires of the dentists and about the probable distribution of dentists among the population for the next few years.

Ninety per cent will engage in private practice. Of those in private practice before entering the service, 62 per cent will return to their former communities, 22 per cent will seek locations in new communities, and 9 per cent are undecided about returning to their former locations. The small towns and the very large cities are less attractive than cities between 5,000 to 100,000 population.

About one fourth of the dental officers would like to become associated with a group of practitioners. This was particularly true among those who had gone into service directly following graduation without having engaged in private practice. Fifteen per cent expressed a desire to remain in the service after the end of the war. Nine per cent would accept full-time positions in industrial dentistry, and 17 per cent would accept part-time positions. Seven per cent would like teaching positions. Additional professional training was desired by 70 per cent of the dental officers.

It is evident that the vast majority desired to return to private practice. Now that the war is over and a considerable number have been released from service, many are discovering that there is neither office space nor equipment available. As a result, some of those who intended immediately to start practicing are taking postgraduate courses or are seeking salaried positions. At the same time recent graduates are being sent into service in order to make it possible for those eligible for discharge to be released.

G.I. BILL OF RIGHTS

As mentioned above, 70 per cent of the dental officers indicated a desire to have additional training, in the nature of refresher or postgraduate courses, before returning to private practice. Under the Servicemen's Readjustment Act (The G.I. Bill of Rights) financial aid is provided to each dental veteran for such a course.

The pre-dental training of many college students was terminated by the war. Under the provisions of the G.I. Bill, they now may receive financial assistance to resume their college work. Most of these men are eligible to receive substantial financial aid for a period of one year, plus an additional period equal to the time they were in active service on or after Sept. 16, 1940, exclusive of A.S.T.P. or Navy V-12 time.

PROPOSED FEDERAL AID TO DENTAL EDUCATION

The Committee on Education of the House of Representatives was instructed to make a study of the effect of the war on higher education and to formulate appropriate legislation to alleviate these effects. Thus for the first time those engaged in the field of education have been called upon by Congress to express their judgment as to their needs and the means by which, through legislation, such needs can be met. The Council on Dental Education was requested to provide relevant data which it had accumulated in its study of the schools touching on the needs of dental education viewed from the national standpoint. This the Council did under the headings of the divisions employed in its 1942-1943 survey of all dental schools in the United States, as follows: Admission, Plant and Equipment, Faculty, Organization and Administration, Library, Financial Management and Support, Clinical Teaching, Basic

Science Teaching, Research, Hospital Relationships.

On the basis of this data the Council further stated that Federal aid for dental education is desirable if it can be afforded without Federal control. Few of the schools are established on a secure and satisfactory financial basis, and a higher level of housing equipment, faculties, libraries, research and graduate offerings depends to a large extent upon better support. Also the Council recommended: (1) a system of undergraduate scholarships not exceeding $500 to any one student in one academic year, covering roughly one tenth of the total undergraduate enrollment; (2) a system of graduate teaching fellowships not to exceed $2,000 to one student in an academic year; (3) a subvention for the support and encouragement of research of $10,000 per annum to each approved dental school.

In submitting the data on Admissions, the Council referred incidentally to the predominance of applications from the large cities and the eastern part of the country and pointed out the desirability of attracting students from all sections and all groups of the population. The wording of the statement was perhaps unfortunate, for it was construed by some to advocate a discrimination against certain racial groups, and such a turmoil was raised over this supposed slight that it is doubtful if any serious attention has been given to the major recommendations of the Council.

BILL TO AID DENTAL RESEARCH AND ESTABLISH A NATIONAL INSTITUTE OF DENTAL RESEARCH

A bill authorizing the appropriation of one million dollars for the erection and equipment of a national institute of dental research and $730,000 annually for dental research was introduced by Senator James E. Murray of Montana. The research would be conducted with the direction of the Surgeon General of the U. S. Public Health Service as a part of the functions of the National Institute of Health at Bethesda, Maryland and at certain other private and public institutions. The dental research that is already being done by the Public Health Service and other agencies would be greatly increased and coordinated.

DENTAL SCHOOL ENROLLMENT AND GRADUATION

The total number of graduates of the 39 dental schools in the United States for the year is 3,212, the highest since 1924. This is owing to the accumulated effect of the wartime accelerated program in the schools. Under normal conditions, the number of graduates was about 1,800. With the end of the war, it is anticipated that practically all of the schools will go back to the conventional four-year course and that the number of graduates will gradually decrease until the full effect of the present low enrollment of freshmen is evident three or four years hence. The enrollment of freshmen during the year was less than half of what it was the previous year, and it is expected that the enrollment will be low for a number of years.

CHANGES IN DENTAL EDUCATION

The cause of dental education in the northwest section of the United States has been greatly enhanced by action of the legislature in the states of Oregon and Washington. In Oregon, the University of Oregon accepted title to the North Pacific Dental College and will place its operation on the University level. In Washington, more than $4,000,000 was appropriated for the erection, equipment, and maintenance of new schools of dentistry and medicine.

An exceptionally large number of dental schools had changes in their administrative heads during the year. Considerable feeling was engendered among some members of the dental profession as a result of the decision of Columbia University to integrate still further the training for the professions of dentistry and medicine and to have one faculty instead of two to administer all of the educational functions at the Columbia Presbyterian Hospital Medical Center. Though the dental school was recently rated as one of the very best in the country by the Council on Dental Education, political pressure has been brought to bear on the Council to suspend its approval of the school, though no visitation to the school has been made by representatives of the Council nor has any change been announced in the teaching program of the school.

DENTO-SOCIAL PROBLEMS

The American Dental Association has gone on record as opposing the latest Wagner-Murray-Dingill Health Insurance Bill on the grounds that health insurance would stifle progress and proficiency and result in a deterioration in the quality of service rendered to the public here as it has in Germany and England. The dental profession, through the American Dental Association, has endeavored to find a more satisfactory financing plan to meet dental care costs, particularly for the medium and low income groups. Though the prepayment principle in meeting hospital and medical care costs has been well established, there is not sufficient information to determine whether similar budgeting plans can be applied to dentistry. The Dental Association recommends and seeks government grants for experimental dental service to be inaugurated by dental societies on the state level. When actuarial data have been obtained, the monthly payment by the subscribers can be adjusted to make the prepayment plan self-sustaining.

It is advocated by the American Dental Association that a plan for budgeting the cost of dental service should (1) provide a dental service that will contribute substantially to a higher level of dental health for its members, (2) assure people in the medium and low income brackets of dental service without financial hardship, (3) provide adequate fees to the dental profession for their services and stabilize the income of the profession, and (4) preserve the private practice of dentistry.

Any discussion of dento-social problems must take into consideration dental personnel. Dr. Lon W. Money, in his study of dental personnel in the United States, points out several pertinent facts: (1) only in the past six years has the profession been able to increase its birth rate of new graduates to a point where it exceeds the annual rate of death and retirement; (2) distribution of dentists is spotty, and there are many areas, particularly rural ones distant from dental schools, that are without dentists to meet minimum standards of dental care; (3) the number of dental hygienists has not come close to matching the increase in the pubic's appreciation of the value of their services; and (4) the gross income of the commercial dental laboratories has increased from $15,000,000 in 1920 to an estimated $125,000,000 in 1944 with a comparable increase in the technical personnel.

With the return of the dentists from military service, the United States will soon have between 70,000 and 75,000 practitioners located largely in the large cities. These dentists will be supplemented by the services of 35,000 assistants, 3,000 hygienists, and perhaps 18,000 technicians. The public's appreciation of good dental health is increasing as is the demand for dental service. How is this increasing demand to be met with the limited personnel available? Some advocate extending the duties of the auxiliary personnel, permitting the hygienists, for example, to perform certain services, under supervision, that are now legally restricted to the dentist. Also, it is recommended that greater emphasis be placed on research, education, and prevention in an effort to discover the causes of dental ills and to establish educational and preventive measures to bring them under control, giving special attention to the needs of children. In an effort to increase the number of dentists, an active program of vocational guidance should be undertaken. Unquestionably large numbers of well-qualified students are overlooking the opportunities of the profession merely because they have not been brought to their attention.

USE OF ANTIBIOTICS IN DENTISTRY

In dentistry, the antibiotics, the sulfonamides, and penicillin have been established as a valuable addition to the traditional forms of therapy, but they are not the panacea for all dental infections that one might have expected from announcements when they first came into general use. The sulfonamides were first demonstrated to be of value in the treatment of hemolytic streptococcal infections. The indiscriminate use of this agent as soon as it was found safe to use in treating human infections, revealed that it was ineffective in various types of infections. Development of other sulpha compounds greatly reduced this number, but there was still a need for better methods of dealing with the surgical infections associated with dental war casualties. Previously discovered, penicillin was now developed and found to be especially active against staphylococcus, the most common organism causing surgical infections. Both the sulfonamides and penicillin have been tried in dealing with the various types of infections in the tissues of the mouth and teeth. Attempt to use them in the treatment of periodontal disease has not met with success; however, in the treatment of the large number of cases of acute Vincent's infection, encountered among the men in service, these antibiotics have proven to be of tremendous value in speedily reducing inflammation and pain. Penicillin has proved to be especially beneficial. The condition returns, however, if the customary prophylactic measures are not instituted shortly after the acute symtoms have subsided.

CARIES RESEARCH

Robert G. Kesel, Joseph F. O'Donnell, and Ernst R. Kirch, of the College of Dentistry and the College of Pharmacy of the University of Illinois, have presented a progress report on their study "Deamination of Amino Acids by the Human Oral Flora: Its Role in Dental Caries Immunity." They state that certain aciduric bacteria, particularly L. acidophilus, are missing from the mouths of patients who have no active caries. The saliva of these individuals does not readily convert glucose into acid. Viable L. acidophilus, inoculated into the saliva of such individuals, has disappeared when cultures were made six to eight hours later.

In an effort to find the cause for the elimination of these bacteria, they found that saliva inoculated into beef broth under certain conditions contained something that was bactericidal to L. acidophilus. Experiments proved this substance to be ammonia nitrogen. The question arises as to what provides the ammonia in these caries-free mouths. Preliminary experiments indicate that caries-immune individuals have enzyme systems capable of converting at least six amino acids into ammonia nitrogen. This study suggests that caries immunity may be owing to the continuous production of minute quantities of ammonia in the bacterial plaque resident on the tooth surface.

FIFTIETH ANNIVERSARY OF THE DISCOVERY OF X-RAYS

Dentists, along with physicians and scientists in general, took advantage of the date, Nov. 8, to commemorate the fiftieth anniversary of the discovery of the x-ray and to honor the discoverer, William Conrad Roentgen, on the centennial of his birth. Though the x-rays provide only one of many means at our disposal to arrive at a correct diagnosis, it is difficult to imagine how greatly progress in the profession would have been retarded without this discovery and the subsequent developments in its application.

VITAL STATISTICS

By HALBERT L. DUNN

CHIEF, VITAL STATISTICS DIVISION, U. S. BUREAU OF THE CENSUS

BIRTH RATE

The birth rate for the United States declined in 1944 from the wartime high reached in 1943. The crude birth rate for the United States in 1944, based on the estimated total population including armed forces overseas, was 20.2 per 1,000 population, or 6 per cent lower than the corresponding rate of 21.5 for 1943. In terms of numbers, there were 2,794,800 registered births in the United States in 1944, or 140,060 less than in 1943.

A decline in the birth rate in 1944 was not unexpected. Following its slow advance from 16.6 per 1,000 population in 1933 to 17.9 in 1940, the birth rate had climbed rapidly to 21.5 in 1943. Among the factors which have been named as contributing to the high rate for 1943 were the increase in the number of marriages following the passage of the Selective Service Act, the desire on the part of families to have a child before the father left for overseas military assignment, and a feeling of greater economic security induced by increased opportunities for employment. During 1943 and 1944, the number of men overseas was much larger than in 1942, a fact which accounts for a part of the decrease in the rate for 1944. The indications are that a further small decrease occurred in the birth rate in 1945. On the basis of provisional figures, it is estimated that there were about 2,740,000 registered births in the United States in 1945.

The crude birth rate varied by state of residence in 1944 from 18.6 per 1,000 estimated civilian population for New York to 32.1 for New Mexico. The rate for the District of Columbia was 19 per 1,000 estimated civilian population. In general the highest birth rates were recorded for residents of the East South Central and West South Central states and the lowest for residents of the Middle Atlantic and New England States.

INTERPRETATION OF THE BIRTH RATE

In the interpretation of the crude birth rates for the country as a whole for the war years, consideration must be given to the fact that a large number of men were with the armed forces overseas and could not have contributed to the birth rate in the United States. Consequently, the birth rates for the war years, based upon the total population of the country including members of the armed forces overseas, are less useful as measures of fertility than in former years. The crude birth rates for states, based upon the estimated civilian population are still less comparable with the corresponding rates for the pre-war years. Although birth rates computed in this way are unsatisfactory in some respects, they have the advantage, especially for interstate comparisons, of being relatively unaffected by the presence of large military establishments in certain areas of the country.

RACIAL DISTRIBUTION OF BIRTHS

The registered births in the United States in 1944 were distributed by race as follows: white, 2,454,700; Negro, 324,183; Indian, 10,541; Japanese, 2,889; Chinese, 1,291; and other non-white races, 1,196. Births of white infants made up 87.8 per cent of the total; those of Negro infants, 11.6 per cent; and those of the other non-white races, 0.6 per cent.

Of the white births, 2,362,290, or 96.2 per cent, were to native mothers; 90,890, or 3.7 per cent, to foreign-born mothers; and the remaining 1,520, or

0.1 per cent, to mothers of unreported nativity. The proportion of births to foreign-born mothers has diminished steadily in recent years as a result of restrictions on immigration and the consequent "aging" of the country's foreign-born population.

ANALYSIS OF HOSPITALIZATION AND ATTENDANCE

A further increase occurred in 1944 in the proportion of births occurring in hospitals. Of the registered births in 1944, 2,112,963, or 75.6 per cent, occurred in hospitals, as compared with 72.1 per cent in 1943. Additional 493,463 births were attended by physicians outside of hospitals. In all, 2,606,426, or 93.3 per cent, of the births in 1944 were attended by physicians. Of the remainder, 178,520 were attended by midwives and 9,854 by other or unspecified attendants.

A far smaller proportion of the non-white births than of the white births were attended by a physician. While 97.9 per cent of the white births were attended by a physician only 60.1 per cent of the non-white births were so attended. A large proportion of the non-white births, 39 per cent, were attended by midwives. The proportion of white births so attended was 1.9 per cent.

DEATH RATE

There were fewer deaths in the United States in 1944 than in 1943, the number recorded for the year being 1,411,338 as compared with 1,459,544 for 1943. The crude death rate for the United States in 1944 was 10.6 per 1,000 population, as compared with 10.9 for 1943. The numbers of deaths refer only to those occurring in the United States and do not include deaths among the armed forces overseas. Correspondingly, the rates are based on estimates of the population excluding members of the armed forces overseas.

The crude death rate varied by state of residence in 1944 from 8.2 per 1,000 total population for Arkansas and Utah to 13.7 for Vermont. In general, the lowest rates were found for residents of the West South Central and South Atlantic states and the highest for residents of the New England and Middle Atlantic States. Important among the factors to be taken into account in interpreting the differences among the death rates for the states are the differences in the age-sex-race composition of the populations of the states.

CAUSES OF DEATH

The 10 leading causes of death in the United States in 1944, with their respective death rates per 100,000 population, were: diseases of the heart, 315.4; cancer and other malignant tumors, 129.1; intracranial lesions of vascular origin, 93.7; nephritis, 69.2; pneumonia and influenza, 61.7; accidents excluding motor-vehicle accidents, 53.5; tuberculosis, 41.3; diabetes mellitus, 26.4; premature birth, 25; and motor-vehicle accidents, 18.3. Together, the 10 causes accounted for 78.3 per cent of the deaths in 1944. Premature birth and pneumonia and influenza were the principal causes of death in infancy. Accidents, excluding motor-vehicle accidents, were one of the most important causes of death among children and young adults, ranking second to pneumonia and influenza in the age group one to four years and taking first place in the age groups five to 14 and 15 to 24 years. Tuberculosis was the second leading cause of death in the last named group as well as in the age group 25 to 44 years. At the older ages, diseases of the heart, cancer, and intracranial lesions of vascular origin had the lead.

A comparison of the crude death rates for the 10 leading causes of death in 1944 with their corresponding values in 1942 (a year in which the crude death rate for all causes reached a record low) shows that the rate for each of the 10 leading causes was higher in 1944 than in 1942, with the exception of the rates for nephritis, tuberculosis (all forms), premature birth, and motor-vehicle accidents. However, the apparent increases in the death rate for all causes and in the rates for the diseases of the older ages, notably diseases of the heart and cancer, probably overstate any real increase in mortality risk. This is because the crude death rates for any of the war years are affected by the withdrawal from the continental population of large numbers of men of military age for duty with the armed forces overseas. In addition to the factor of physical selection, which left behind an accumulation of the poorer risks, the withdrawal of men at the younger ages where the death rate is low had the effect upon the remaining population of increasing the proportion of persons at the older ages where the death rate is high.

INFANT AND MATERNAL MORTALITY

The infant mortality rate for 1944 was 39.8 per 1,000 live births, 1.5 per cent lower than that of 40.4 for 1943. Of the 111,127 deaths of infants under one year of age in 1944, 90,607, or 81.5 per cent, were of white infants and 20,520 or 18.5 per cent, of non-white infants. The infant mortality rate for white infants in 1944 was 36.9 per 1,000 live births, as compared with 37.5 for 1943. The rate for non-white infants was 60.3 per 1,000 live births, as compared with 62.5 for 1943.

Maternal deaths numbered 6,369 in 1944, as compared with 7,197 in 1943. The maternal mortality rate in 1944 was 2.3 per 1,000 live births, 8.0 per cent lower than the rate of 2.5 for 1943. Both infant and maternal mortality rates for 1944 are the lowest ever recorded for the United States.

PUBLICATIONS

The following regular series of publications pertaining to vital statistics were issued during 1945 by the Bureau of the Census: *Vital Statistics of the United States, 1943,* Part I and Part II; *Weekly Mortality Index; The Registrar,* a monthly release; *Monthly Vital Statistics Bulletin; Current Mortality Analysis,* a monthly release; *Annual Summary of Motor Vehicle Accident Fatalities, 1943,* and *Quarterly Summaries of Motor Vehicle Accident Fatalities, 1944; Vital Statistics—Special Reports, National Summaries,* vol. 21, numbers 1-16, containing tables and analytical text on various topics in vital statistics for the United States, 1943; *Vital Statistics—Special Reports, State Summaries,* vol. 22, numbers 1-53, containing summaries of 1943 data for the United States, each state, Territory of Hawaii, Puerto Rico, and Virgin Islands; *Vital Statistics—Special Reports, Selected Studies,* vol. 23, numbers 1-6, containing special studies in the field of vital statistics.

COORDINATION OF VITAL RECORDS AND VITAL STATISTICS IN THE UNITED STATES

During 1945, the energies of the professional staff of the Vital Statistics Division of the U. S. Bureau of the Census were largely directed toward strengthening the registration system throughout the United States and working toward greater uniformity of procedures. To this end, a staff of consultants is maintained in the Vital Statistics Division of the Bureau to assist state registrars in planning and inaugurating improved methods and techniques.

An important factor in solving interstate registration problems is the Council on Vital Records and Vital Statistics which was organized in the fall of 1944. The voting membership of the Council is composed of registrars of states and independent registration areas, chosen on a regional basis, and its recommendations are subject to ratification by the designated state registration executives. Hence, it expresses the majority opinion of the states in dealing with registration problems of national interest. Regional meetings, committee activities, and cooperative field studies have enabled the Council to grapple with such basic registration problems as inaccuracies in birth and death certificates; incompleteness of registration and lack of proper safeguards against unwarranted disclosure of illegitimacy. Measures are being adopted which will eventually result

TABLE A

CRUDE BIRTH AND DEATH RATES, MATERNAL AND INFANT MORTALITY RATES, AND STILLBIRTH RATIOS: REGISTRATION STATES,[1] FOR SPECIFIED YEARS

(Births and deaths exclusive of stillbirths. Birth and death rates per 1,000 estimated population; maternal and infant mortality rates and stillbirth ratios per 1,000 live births)

Year	Crude Birth Rate	Crude Death Rate	Maternal Mortality Rate	Infant Mortality[2] Rate	Stillbirth Ratio
1944	[3]20.2	[4]10.6	2.3	39.8	27.0
1943	[3]21.5	[4]10.9	2.5	40.4	26.7
1942	[3]20.9	[4]10.4	2.6	40.4	28.2
1941	[3]18.9	[4]10.5	3.2	45.3	29.9
1940	[3]17.9	[4]10.7	3.8	47.0	31.3
1939	17.3	10.6	4.0	48.0	32.0

[4] Excludes armed forces overseas.

in more timely issuance of statistics, and greater consistency is being developed between vital statistics data published by the states and by the Federal Government.

REVISED INTERNATIONAL LIST OF CAUSES OF DEATH, AND JOINT CAUSE STUDY

The International Commission for the Decennial Revision of the International List of Causes of Death, at its last meeting held in Paris, France, in 1938, recommended that the United States establish a committee to study methods of selection of causes of death for statistical tabulations. Accordingly, a Committee on Joint Causes, under the chairmanship of Dr. Lowell J. Reed, was created early in 1945, at the request of the Department of State of the United States, with Dr. Halbert L. Dunn and Dr. Selwyn D. Collins as secretaries of mortality and morbidity codes, respectively. Its membership includes representatives from Canada, United States, League of Nations, and an adviser to the Committee from England. The Committee met for the first time in Washington, D. C., Dec. 10-12, 1945.

As a part of the Committee's program, a study is being made by the Bureau of the Census of results obtained from various methods of coding causes of death. Some 90,000 microfilm copies of death certificates are being used for this purpose, and are being coded by our present method of classification, by the English method of selection, and by various modifications of the two systems. In order to obtain as complete and comprehensive a view of the problem as possible, all causes on the death certificates will be coded. Also coded are the causes which do not enter the statistical tabulations resulting from the use of the existing

TABLE B

CRUDE DEATH RATES FOR SELECTED CAUSES: UNITED STATES, 1942–1944

(Exclusive of stillbirths. Rates per 100,000 estimated population. Numbers after causes of death are those of the detailed International List of Causes of Death, 1938 revision)

Line No.	Cause of Death	1944[1]	1943[1]	1942[1]
1	All causes........	1,064.7	1,089.5	1,035.5
2	Typhoid and paratyphoid fever........ 1, 2	0.4	0.5	0.6

Other causes	153,573	142,396	11,177	1,557.8	1,547.6	1,700.5

systems for selection of the primary cause of death. It is anticipated that the study will be completed early in the summer of 1946. It is hoped that this study will solve many of the problems of joint-cause selection.

Since the establishment of the Committee on Joint Causes, a Budget Bureau Committee on Statistical Classification of Morbidity has been working on a morbidity code for use by Federal agencies. Its recommendations will be submitted to the Committee on Joint Causes.

COOPERATION WITH AMERICAN REPUBLICS

In 1942, as a part of the State Department Program for Cooperation with the American Republics, the Vital Statistics Division of the Bureau of the Census initiated a project to assist officials of the American Republics in the study and development of vital statistics and public health statistics. The project provides two types of assistance: (1) the detailing of technical experts to the American Republics to act in the capacity of consultants in the fields of vital statistics and public health statistics; (2) the awarding of intern training grants to selected candidates from the American Republics, to enable them to study the organization, methods, and procedures employed in vital statistics work in the United States. The program is designed to improve and standardize the vital statistics systems of the American Republics in accordance with resolutions adopted at a number of recent Pan American conferences, and particularly the resolutions of the Eleventh Pan American Sanitary Conference held at Rio de Janeiro in 1942.

The consulting program was started in 1942, since which time, projects have been initiated in Haiti, El Salvador, Paraguay, the Dominican Republic, and Colombia, in the order named. Most of the other countries of South and Central America and the Caribbean area have been visited for the purpose of making preliminary surveys and observations.

Since the initiation of the program, 12 intern training grants have been awarded to candidates from Latin American Countries, distributed as follows: Brazil, one; Chile, one; Colombia, one; Dominican Republic, three; Ecuador, one; Haiti, one; Panama, one; Paraguay, two; and Peru, one. Two of the candidates from the Dominican Republic were sent entirely at the expense of that government, which represents a substantial contribution to the program and indicates the enthusiasm with which it has been received. Of the total, five candidates (one each from Brazil, Chile, and Haiti, and two from Paraguay) have completed their training and returned to their respective countries, where they are now employed as vital statistics officials. The remaining candidates are in various stages of training.

DIVISION XXIV

PSYCHOLOGY AND PHILOSOPHY

PSYCHOLOGY

By WILBUR S. HULIN
PROFESSOR, PACIFIC UNIVERSITY

GENERAL

Texts.—There is a prevalence of practical books on psychology. T. L. Engle has written *Psychology, Principles and Applications* (World Book); K. S. Bernhardt's *Practical Psychology* (McGraw-Hill) deals with improved ways of thinking, getting along with others, and mental health; H. Beaumont's *Psychology of Personnel* (Longmans, Green) treats labor techniques; B. V. Cunningham's *Psychology for Nurses* (Appleton-Century) considers the nurse's own adjustment to her new environment; H. Deutsch's second volume on *Psychology of Women* (Grune & Stratton) is concerned with "motherhood."

Historical.—R. E. Brennan has written a *History of Psychology* (Macmillan) which describes the subject from the standpoint of the theology and philosophy of St. Thomas. V. Venable sketches a Marxian view of *Human Nature* (Knopf).

Schools.—In a symposium upon the subject of "operational definitions" (definitions stated in terms of the methods used to obtain facts), E. G. Boring warns that as soon as a phenomenon is defined operationally there is a need for similar operational definitions of antecedent and subsequent phenomena; P. W. Bridgeman adds that definitions of the cultural setting of the phenomenon must be included; and H. E. Isreal cautions that any such definition implicates all of human behavior (*Psych. Rev.,* Sept.). A rising school, called "Personalistic Psychology," is implicit in all of the schools, such as Gestalt and developmental psychology, which are based on the actions of the whole individual, according to E. B. Skaggs (*ibid.* Sept.).

Methods.—E. S. Tolman declares that the basic forces of man's mental activity are not the cultural forces but rather the individual processes of motivation and adjustment to conflict—processes which can be studied in rats as validly as they can be studied in man (*Science,* Feb.). O. T. Bailey asserts that the psychological study of animals and of human beings should be carried out at a different level of scientific research than is the study of anatomical reflex arcs and other neuroanatomical problems (*Philos. of Sci.,* Jan.).

POST-WAR

Rehabilitation.—A symposium on "Rehabilitation and the Returning Veteran" includes a description by W. R. G. Bender of the personal characteristics of the veteran; a résumé by E. L. Ginsberg of the process of readjustment and of the organized sources of aid to the veteran, such as are set up in New York City; and a statement by S. W. Ginsberg of the responsibilities of the community (*Ment. Hyg.,* Jan.). G. M. Gilbert previews the adjustment problems of returning veterans; he believes that the majority of maladjustment problems have their origin in the social environment of earlier life; war aggravated the conflicts of civilized living; a social program of mental hygiene will be needed as a remedy (*J. Abnormal & Soc. Psych.*, July). The special needs and problems of military women in readjusting to civilian life are assayed by P. Soloman and M. C. Winfield (*Amer. J. Orthopsychiat.*, July).

Peace.—Under the editorship of G. Murphy, a number of the members of the Society for the Psychological Study of Social Issues have contributed articles on *Human Nature and Enduring Peace* (Houghton Mifflin): what psychology can do and can not do in contributing to an adequate strategy against war is stated; the positive program includes abolition of class war at home and an expansion of democratic enlightenment. In a survey of the opinions of psychologists on peace planning, R. Stagner summarizes their beliefs in the statement that aggression (war) is the result of frustration rather than that there is an inherent aggressiveness in mankind; the main psychological proposal is to reduce ego frustrations and biological thwartings (*J. Psych.*, Jan.). E. A. Strecker expresses the faith that there is a feeling of sameness in all men which constitutes an "inner citadel of democracy" which should prevent humans from following the blandishments of future war propagandists (*J. Nerv. & Ment. Dis.*, May).

PERSONALITY

Influences.—R. Linton's book, *The Cultural Background of Personality* (Appleton-Century), confines its description of human personality to ordinary and distinctive events in specific social groups rather than to generalized ethnological considerations. To answer the question, "What is a normal personality?" F. J. Haeker specifies an adjustment between the inner laws of an individual's various drives and the social stimuli received from the outside world (*Amer. J. Orthopsychiat.*, Jan.). P. Mullahy asserts that personality is derived from the particular interpersonal relationships which an individual encounters and the interpersonal relations depend upon the particular social order which is their matrix (*Psychiat.*, May).

Components.—P. M. Symonds states that people differ from one another in intellectual capacity, individual adjustment, and in social adjustment; employment interviewers should take all three factors into consideration (*Personn. J.*, Feb.). P. A. Bertocci champions a "psychological self" concept which unifies the diverse functions of the personality; it does not have experimental value, but serves as a framework for the classification of empirical data regarding the personality (*Psych. Rev.*, March).

Tests.—A. L. Benten believes that the Minnesota Multiphasic Personality Inventory successfully identified psychopathic deviates with reasonable accuracy in a naval hospital (*J. Nerv. & Ment. Dis.*, Oct.). W. E. Jacobson has devised a useful scheme for measuring first impressions of people; use is made of a set of 49 concrete factors classified under the headings of physical traits, intelligence, clothing, grooming, and temperamental attitudes; college freshmen were predominantly favorable toward their classmates in using these traits (*J. Appl. Psych.*, Apr.). R. B. Cattell has plotted a chart portraying a system of nuclear clusters required for the description of the total personality (*Psych. Bul.*, March).

SENSATION

General.—Discussing "the natural history of experience," C. J. Herrick feels that the biologist may approach the psychological problem of experience from the genetic side, that is, through the increasing scale of sensitivity and discrimination of the animal series; this approach will lead to a proper evaluation of experience, on which science depends (*Philos. of Sci.*, Apr.).

Vision.—E. Murray insists that color blindness is inherited and can not be cured, as is sometimes alleged (*Amer. J. Psych.*, April). A wide variety of "psychometric problems in ophthalmology" has been discussed by

O. Lowenstein and others who emphasize the influence of the autonomic nervous system on the lens and iris of the pupil, especially during emotional states (*J. Clin. Psychopathol.*, Jan.). D. J. Lyle's *Neuro-Ophthalmology* (C. C. Thomas) deals with the relation of the eye to the brain. R. Granit employed micro-electrodes in a cat's retina and measured the changes to selective adaptation to red, blue, and green lights; the adapting color process suppresses sensitivity in its own spectral range and thus facilitates discovery of units stimulated by other parts of the spectrum; six or seven fundamental sensory points may exist rather than only three, as claimed in the old trichromatic theory (*J. Neurophysiol.*, May). Studying after-images in 200 school children, J. E. Morsh and H. D. Abbot have decided that there is no distinct phenomenon of eidetic imagery nor is there a continuum between ordinary retinal after-effects and memory images (*J. Comp. Psych.*, Feb.). Visual efficiency, as it refers to eye-strain and fatigue, can not be reliably measured by the frequency of blinking, as has been claimed by Luckiesh and Moss, according to M. E. Bitterman (*J. Exper. Psych.*, Aug.).

Audition.—R. F. Wyatt has demonstrated that with musical and non-musical subjects an improvement in pitch discrimination can be attained at various levels of the scale; an average of 30 per cent reduction in errors was gained by the 16 subjects (*Psych. Monog.*, No. 267). After a careful evaluation of the theories of sound conduction in the middle ear, P. Kellaway concludes that there is relatively only an "inertial" movement of the bones of the middle ear and that much of the sound conduction occurs through the compression of the skull cavities (*Amer. J. Psych.*, Jan.). J. C. Howard outlines the task of preparing hearing aids for the 250,000 war veterans who suffered impairment of hearing; some veterans have a uniform loss at all frequencies, others have either a high or a low impairment (*Nav. Med. Bul.*, March).

Touch.—Cutaneous sensations are greatly affected by autonomic nervous changes; for example, dilation of the arterioles and the activity of the sebaceous glands alter the touch qualities (*Psychosom. Med.*, March). B. S. Ray and H. G. Wolff believe that intense pain excitations spread through nervous connections in the spinal cord to other neural elements so that the pain sensations seem to be located widely over the body (*Arch. Neur. & Psychiat.*, April). W. P. Elhardt has noted a heightened sensibility to pain in certain emotional states despite the frequent obliviousness caused by the distraction of attention (*Fed. Proc. Amer. Soc. Exper. Biol.*, Feb.).

Vestibular.—Clinical observations of a patient deprived of his vestibular nerve demonstrated that a person can maintain stable posture despite loss of vestibular functioning; from measurements of normal subjects as well as from clinical subjects the conclusion is drawn that neither body sway nor positional nystagmus is a criterion of the equilibratory process (*J. Exper. Psych.*, April).

Perception.—V. Lowenfeld has designed an interesting method for determining the relative strength of a person's visual form perception and imagery and compared with his tactual perception and imagery; for example, a person tactually examines various cardboard geometric figures and identifies the touch perception by picking out the corresponding form from a set of visual figures (*Amer. J. Psych.*, Jan.).

AFFECTION

Emotion.—By injecting into rats the blood of emotional human beings changes were noted in the intestinal contractions of the rats; these changes resembled those resulting from injections of epinephrine or acetylcholine (*Arch. Neur. & Psychiat.*, Aug.). M. B. Arnold contends that the emotion, anger, results from a discharge of the parasympathetic nervous system, rather than of the sympathetic system which regulates the emotional pattern of fear (*Psych. Rev.*, Jan.).

Feeling.—E. L. Thorndike studied 12,000 words which have pleasant or unpleasant meanings, and found a correlation of plus .40 between these meanings and certain verbal sounds; the average of similar correlations for five different languages was plus .26 (*ibid.* May). P. Woodward appraised the relative effectiveness of various appeals in presenting a new and unfamiliar foodstuff, the soybean, in cafeteria menus; a decrease in consumption of the soya dishes came with appeals to "nutritional" values, but the greatest increase in consumption came with appeals to "American," "money," and "variety" (*Amer. J. Psych.*, July).

Aesthetics.—M. Beck indicates the cognitive character of aesthetic enjoyment: aesthetic experience, like religious experience, reveals basic realities (*J. Aesth. & Art. Crit.*, June). B. R. Philip ascertained the following color preferences in fashion: men select blue first, then black, and show least preference for brown and red; women also select blue most often, and other colors in about equal degrees (*J. Appl. Psych.*, April).

THOUGHT PROCESSES

Cognition.—R. W. Sellers characterizes our intellectual process of knowing truth and falsehood as depending on the "determinateness" of a sequence of ideas or experiences, and by the "incompatibility" between ideas (*Philos. & Phenomenol. Res.*, March). D. H. Parker supports the relatively greater realism of immediate experience—"knowledge by description"—over the inferential "knowledge by acquaintance" derived through judgment (*Philos. Rev.*, Jan.). E. Heidbreder stresses the dynamic nature of cognition (a type of mental process that is usually contrasted with dynamic action); thoughtful, rational processes are as influential upon motives and incentives as are emotions and drives (*Psych. Rev.*, Jan.).

Reasoning.—J. J. B. Morgan tested the logical insight of 300 college students by presenting a problem with the advance knowledge that there were but five possible solutions; 89 per cent of the students chose the correct solution; in other problems of similar character where no aid in the solution was given, 57 per cent of those who responded correctly to the first problem now responded with the same type of solution although it was now incorrect and illogical (*Amer. J. Psych.*, Jan.). The same author also demonstrated that the caution developed through the commission of logical errors will often promote the development of reasoning ability more than a uniformly successful accomplishment of correct logical moves (*J. Educ. Psych.*, Oct.). J. Hadamard portrays *The Psychology of Invention in the Mathematical Field* (Princeton Univ.).

Intelligence.—M. Sherman's *Intelligence and Its Deviations* (Ronald) correlates the medical, psychological, and social data on intelligence. Seventy-nine experts in the field of mental measurement were asked to give their suggestions about current testing procedures; 55 of the experts recommended an emphasis upon the testing of separate rather than general factors of intelligence; among other recommendations, 49 rated personality tests as unsatisfactory and 51 rated the Rorschach test as dubious (*Educ. & Psych. Meas.*, Spring). B. L. Wellman summarizes 50 articles on I. Q. tests of children during preschool years and reports an average increase of 14 points for pre-school children and an increase of 6 points for non-pre-school children (*J. Psych.*, Oct.).

ABNORMAL

General.—E. A. Strecker and K. E. Appel contrast the psychiatric concepts of the two world wars in their book, *Psychiatry in Modern Warfare* (Macmillan); the book gives special attention to the demobilized soldier. F. F. Hoffman appraises the influence of psychoanalysis on authors in *Freudianism and the Literary Mind* (Louisiana State Univ.). O. J. Kaplan discusses *Mental Disorders in Later Life* (Stanford Univ.). O. S. English and G. H. J. Pearson offer the medical doctor's viewpoint on *Emotional Problems of Living* (Norton).

Therapy.—The August-November issue of *Sociometry* brought together contributions of 40 authorities on "Group Psychotherapy"; group projection methods, group interview methods, and group discussions and testimonials are discussed. "Bibliotherapy" is important for psychotic patients, states J. M. Schneck, who urges that institutional libraries analyze the literature read by the inmates (*Psychiat.*, May). R. P. Knight asserts that psychoanalysis is only a special type of therapy which can not begin to cope with all of the growing demands of psychiatry (*Amer. J. Psychiat.*, May). A new type of therapy, called "electronarcosis," is used to treat schizophrenia; the treatment consists of a prolonged application of electric current to the brain causing a controlled state of unconsciousness preceded by a modified convulsion; the results are less effective than insulin therapy: E. B. Tietz and others (*ibid.*). There may be a great delay in the appearance of favorable effects of psychotherapy, reports J. C. Yaskin; the initial therapy, though repelled, may act as an inoculation (*J. Nerv. & Ment. Dis.*, June).

Special Conditions.—R. Seliger and V. Crawford offer a useful book of advice on alcoholism for both professional and lay readers: *Alcoholics Are Sick People* (Alcoholism Publ.). In migraine headache, the cranial arteries, especially the temporal artery, become distended, as measured by C. Torda and H. G. Wolff (*Arch. Neur. & Psychiat.*, May).

PHYSIOLOGICAL

Nervous System.—A new edition of A. Kuntz's book, *The Autonomic Nervous System* (Lea & Febiger), has appeared. A. R. Moore has designed an important outline of the basic steps of mental organization, beginning with the autonomous movements of protoplasm and continuing through the specialization of cells and the stages of aganglionic and ganglionic nerve organizations: *The Individual in Simpler Forms* (Univ. of Oregon). J. M. Rogoff declares that emotional responses are not directly related to adrenal gland secretions, because secretory functions do not act quickly enough nor show sufficient physiological utility to be a part of the emergency system of emotional response (*J. Gen. Psych.*, May).

Brain.—According to W. C. Halstead, brain injuries sometimes cause a loss in a general "power factor" or "vigilance factor" in the intellectual capacities; the result is a neurotic condition of hesitancy, indecision, and suspicion (*J. Psych.*, July). Similarly, A. Adler illustrates from 200 cases of brain injury that the most frequently occurring mental symptom (disregarding headache and dizziness) is that of anxiety (*Arch. Neur. & Psychiat.*, Jan.). The use of prefrontal lobotomy, *i.e.*, cutting off the front part of the cerebrum, is continuing to prove highly beneficial in cases of schizophrenia, often permitting complete social remission for the patient: W. Freeman & J. W. Watts (*Amer. J. Psychiat.*, May). A very comprehensive historical survey of findings on psychological changes in organic brain injuries and ablations has been gathered by S. G. Klebanoff who urges a more skillful use of mental tests in diagnosing patients (*Psych. Bul.*, Nov.).

Fatigue.—R. R. Grinker and J. P. Speigel have reported upon a psychological and physiological study of *Men under Stress* (Blakiston) based on war casualties hospitalized for "operational fatigue." S. H. Bartley and E. Chute classify the various conditions associated with fatigue as impairment, conflict, maladjustment, misalignment with a goal, and interpersonal incompatibility (*Psych. Rev.*, May).

ANIMAL

Habits.—P. T. Young has concluded that dietary habits become established according to their service in the ingestion of foods; the time pattern and the kind of nutrition are the main conditions to be stabilized; experiments with animals indicate that there may be several "partial hungers" for foods which the animal will continue to eat after it has become satiated with some other kind of food (*Comp. Psych. Monog.,* May). . In comparing habits of frogs and toads, A. N. Bragg has found that toads exhibit much greater acumen in their selection of appropriate foods; when in peril there are distinctive age and sex differences in the attitudes of defense: males make a "protest sound" whereas females remain silent (*J. Gen. Psych.,* Jan.). E. J. Farris and E. H. Yeakel found characteristic differences between the emotionality of 73 Norway rats and 73 albino rats (*J. Comp. Psych.,* April).

Receptors.—By treating the eyes of pigeons with various drugs in order to study the mechanism of accommodation, R. H. Gundlach and others concluded that the whole shape of the eye probably changes, most notably in the cornea, iris, and lens (*ibid.* Feb.). R. W. Sperry found that, after crossing the optic nerves in frogs, there was a recovery of coordination in about 22 days, but the eye-movements remain reversed (*J. Neurophysiol.,* Jan.). R. C. Noble's *The Nature of the Beast* (Doubleday, Doran) is a popular though factually correct account of animal behavior.

LEARNING

Habits.—O. H. Mowrer and H. Jones have examined the experimental findings of G. Humphrey, namely, that habits strengthened by intermittent rewards are better than are habits rewarded after every repetition; the explanation is given that intermittent reward permits the development of secondary, psychogenic drives, such as "hope" or "faith," which reenforce the primary, viscerogenetic drives (*J. Exper. Psych.,* Aug.).

Memory.—D. S. Mackay evaluates "memory" as illusory, and presses for greater dependence upon the present in the pursuit of security rather than on the past; memories are the apparent existence of something which we know to be non-existent (*Philos. Rev.,* July).

Conditioning.—Trace conditioned responses can be extinguished better by massed extinction trials (*i.e.,* with no reenforcement by the natural stimulus) than by distributed trials unless the conditioning series is massed: B. Reynolds (*J. Exper. Psych.,* Apr.). A. U. Moore and F. L. Marcus studied the learning abilities of two sows; salivary conditioned responses were established using food and a clicking metronome as stimuli; conditioned lid reflexes and also increased speed of heartbeat were established (*J. Comp. Psych.,* Feb.). In trial-and-error learning there is, according to W. R. Ashby, a physiological self-organization by the nervous system which leads to adaptive behavior; the appearance of a problem means a break in the organism's adaptation (*J. Gen. Psych.,* Jan.).

Reading.—J. E. Bell believes that much of the success in remedial reading techniques is owing to an improved emotional state in the retarded reader (*J. Consult. Psych.,* May). V. Lannert and M. Ullman have made a useful compilation of the many factors involved in the reading of piano music; a list of rules is also given; for example: "Try to read more rapidly than you play" (*Amer. J. Psych.,* Jan.).

CHILDREN

Books.—L. Carmichael has edited a *Manual of Child Psychology* (Wiley) which represents a large compendium of facts, theories, and techniques on the development of the child; the volume has a wide application at a fairly technical level. F. Goodenough has a revised edition of her *Developmental Psychology* (Appleton-Century). P. H. Landis, in *Adolescence and Youth* (McGraw-Hill), emphasizes the situational, environmental treatment of young people, rather than an analysis of internal mechanisms.

Adjustment.—E. R. Geleerd believes that, to deal with children's temper tantrums by means of firm and consistent though kindly treatment, is right for those children who have matured beyond a very infantile level, but for the child who is still an infant emotionally the most important phase of treatment is to give the child a feeling of assurance and of continued affective security which may be destroyed by appeals to reason (*Amer. J. Orthopsychiat.,* April). A. L. Baldwin, J. Kalhorn, and F. H. Breese find that children from democratic homes are better adjusted socially than are children from indulgent homes; distinctive patterns of parent behavior can be depicted especially between parents who reject their children, those who are casual toward their children, and those who accept their children (*Psych. Monog.,* No. 268). M. Bentley characterizes the growth function of the teens as being "reconstructive," and the twenties as being "stabilizing" (*Amer. J. Psych.,* July).

Tests.—From measurements on the Bell Adjustment Scale, the Guilford Inventory, and other scales, M. P. Wittman and A. V. Huffman reveal distinctions between normal children, psychotic children, and delinquent boys and girls; the effects of early home environment can be demonstrated by these measurements (*J. Genet. Psych.,* June). D. T. Tyler reports that the scores obtained on the Home Adjustment and Emotional Adjustment items of the *Bell Adjustment Inventory* are, for "only" children, more favorable than for siblings (*J. Educ. Psych.,* May).

SOCIAL

General.—E. Faris reviews the beginning of social psychology and its subsequent course during the past 50 years (*Amer. J. Sociol.,* May). R. West's book, *Conscience and Society* (Emerson), considers the psychological prerequisites of law and order. C. A. Ellwood places "the psychological basis of culture" on collective processes of learning and imagination; individual mentality must be improved in order to attain an improved general culture (*Sociol. & Soc. Res.,* July). G. H. Seward integrates the biological and social approaches to the subject of *Sex and the Social Order* (McGraw-Hill). T. Reik's *Psychology of Sex Relations* (Farrar & Rinehart) catalogues the present-day variations of Freud's theories. A. Kardiner, R. Linton, C. DuBois, and J. West, in *The Psychological Frontiers of Society* (Columbia Univ.), create a fusion of psychiatric and anthropological explanations of group phenomena.

Controls.—K. Menninger describes the necessity of educating traffic police in the facts of psychology, such as in the difference between the intelligence of drivers, so that policemen can exert authority without bullying (*Bul. Menninger Clin.,* Jan.). R. Corsini, in evaluating the therapeutic treatment of prison inmates, suspects that "some bright day prisons may have more psychologists than keepers" (*J. Consult. Psych.,* March). D. Abrahamsen makes a plea for an increased use of psychoanalytic therapy in social casework in order to solve the social problems which often lead to crime; the author points out that an individual's whole environment, social and natural, contributes to his state of adjustment (*J. Nerv. & Ment. Dis.,* July).

Attitudes.—F. H. Allport and M. Lepkin dissected the public's impulses to believe wartime rumors about waste and special privilege and found the greatest credulity occurring in circumstances of greatest deprivation and inconvenience (*J. Abn. & Soc. Psych.,* Jan.). A. M. Lee's clinical analysis of propaganda brings out a picture of the personality of the propagandist himself who tries to bring out his own good points while the opposition tries to bring out his bad points (*Amer. J. Sociol.,* Sept.).

Education.—Textbooks include J. B. Stroud's *Psychology in Education* (Longmans, Green), A. D. Woodruff's *Psychology of Teaching* (Longmans, Green), and C. E. Skinner's *Elementary Educational Psychology* (Prentice-Hall). American high schools, though developed in a democratic tradition, reveal the emergence of certain class distinctions; for example, H. P. Smith has found that in 28 out of 31 extra-curricular clubs the students possessed an average socio-economic status which was significantly higher than that of the total student body (*J. Educ. Psych.,* April). C. P. Ingram and others urge a greatly increased program of special education for mentally handicapped children (*Amer. J. Ment. Deficiency,* Jan.).

Race.—In a symposium on Race Relations, S. Mekeel describes certain constructive cultural aids, such as emphasis on inevitable class (rather than radial) distinctions like those that appear even in Soviet Russia; R. L. Cooper describes the urgency of a "leadership approach" to promotion of race equality to overcome the inertia of the general public; H. C. Oppenheimer cites instances in which the hospital ward has been an influential medium for social equalization (*Ment. Hyg.,* April).

INDUSTRIAL

Prospects.—Comparing "academic" and "professional" psychology, A. T. Poffenberger predicts "thrilling times" for applied psychology; the continuation of a central office as was set up in Washington, D. C. during the war will be needed for coordinating the new demands for psychological services (*J. Consult. Psych.,* Jan.). H. D. Kitson has compiled a helpful list of publications and pamphlets describing various occupations (*Occup.,* July). In W. J. Reilly's book on *The Law of Intelligent Action Applied in Business Relations* (Harper), an analysis is made into the desires, abilities, and capacities required for handling human relations.

Skills.—W. R. Miles, discussing psychological aspects of military aviation, points out various techniques of flying which will be important for peacetime navigation; there are also important psychological techniques which will be useful in the selection and training of flyers, as well as for the protection and maintenance of traffic; a meaningful "patter" for instructors has been devised from an examination of the trainee's mental processes during instruction (*Amer. Scientist,* July). F. S. Endicott lists the personal qualities of prospective employees (especially college graduates) desired by 70 corporations who submitted answers to a questionnaire (*Publ. Person. Rev.,* April).

Personnel.—J. E. Walter's book on *Personnel Relations* (Ronald) portrays the significance of these relations in a democracy as they function in government regulations and in labor-management cooperation. N. Cantor's *Employee Counselling* (McGraw-Hill) presents case studies to illustrate the role of the factory as a social system. Rules to be used by industrial management for stimulating favorable motives in workers are set forth by G. M. Wilson and others (*Personn. J.,* Oct.). There are now 350 positions in employee counseling in the Federal department services, according to M. E. Barron's report on the emerging role of public employee counseling since 1938 (*Publ. Person. Rev.,* Feb.).

PHILOSOPHY

By Emerson Buchanan
Bibliographical and Research Assistant in Philosophy,
Columbia University

GENERAL

The war continued during 1945 to curtail literary production in Philosophy as in other fields. The absence of some of the younger philosophers in the armed forces and the increased teaching load of those remaining at home, together with other wartime duties, were largely responsible for this. The shortage of paper, besides reducing the output of new works, also handicapped teachers and students by causing standard works to go out of print.

NATURALISM AND DEMOCRACY

Probably the most significant concern of Philosophy during the war years has been the conflict over naturalism. The issues debated are important not only for theoretical philosophy but for the practical affairs of morals, politics, and education. Theologians, scientists, and literary men as well as philosophers have taken part.

One of the important documents on the naturalist side, *Naturalism and the Human Spirit,* edited by Yervant H. Krikorian (New York, Columbia Univ. Press), appeared in the latter part of 1944. It is a collection of 15 essays by John Dewey, S. P. Lamprecht, Sidney Hook, and others, beginning with Dewey's vigorous defense of naturalism against recent attacks ("Antinaturalism in Extremis") and ending with a brilliant general statement of the naturalist position, based on the preceding essays, by J. H. Randall, Jr. ("Epilogue: The Nature of Naturalism"). In between are papers on religion, democracy, ethics, logic, and a variety of other matters.

It is clear from this volume that the primary postulates of the naturalism represented by its authors are assertions about the sources of knowledge and the methods of attaining it. Nature is taken as the all-embracing category, including man with his mind, his culture, and his moral, religious, and aesthetic interests. All dualisms, whether of the natural and the supernatural or of mind and nature, which require discontinuity in analysis and the use of radically different methods for the discovery of truth about diverse subject-matters, are rejected. The empirical, experimental methods developed in the natural sciences are applicable to all subject-matters, including distinctively human activities, and are the only methods capable of yielding truth. Supernatural or transcendental causes, allegedly discovered by nonempirical methods, are ruled out; all explanation is in terms of natural causes discoverable by the methods used in the sciences.

Although naturalism is distinguished from other philosophies primarily by its methodological principles, naturalists are united also in denying the existence of a supernatural or transcendental realm of being, a transcendent God, and a substantial, immortal soul. Some, however, have stated explicitly that the denial is not arbitrary or *a priori* but is based on the fact that there is no empirical evidence to warrant belief in their existence; and this probably represents the general opinion among naturalists.

They are equally opposed, however, to that sort of materialism which tries to reduce everything to the mechanical motions of matter and makes mind a mere epiphenomenon. Reality is not denied to any of the traits which things are empirically discovered to have and which distinguish various subject-matters from each other. The enlarging and deepening of scientific methods, especially through the development of biological, psychological, and social sciences, have made such methods adequate to the investigation of all subject-matters without the necessity of reductionism.

CONTROVERSIAL DISCUSSION OF NATURALISM

Prof. W. H. Sheldon of Yale ("Critique of Naturalism," *Journal of Philosophy,* XLII, 1945, pp. 253-270) contends that the naturalism represented in this symposium is just materialism—not, perhaps, in the sense of claiming that all events are logically reducible to spatio-temporal redistributions of bodies, but in the sense of claiming that all control is exercised through such redistributions and that mental or spiritual states and processes exercise no control over the physical. Furthermore, the scientific method advocated by the naturalists is that of the purely physical sciences, which involves public verifiability and thus rules out from the start any private mental events, mystical experiences, etc. Hence, the possibility of the supernatural is rejected *a priori,* but the majority of philosophers believe that there are other ways of reaching truth, and the naturalists' assumption that the scientific method is the only one is purely arbitrary.

Dewey, Hook, and Nagel ("Are

Naturalists Materialists?" *Journal of Philosophy,* XLII, 515-530) reply to Sheldon that they are certainly not reductionists but that they are materialists in the sense of maintaining that minds are adjectival and adverbial of bodies, that there are no independent, substantial minds or souls capable of exercising control over the physical, and that all control is through the manipulation of embodied things. Men do have private experiences, even mystic experiences of the "Divine," but the mere having of experiences does not constitute knowledge. Moreover, what is not publicly observable may be publicly verifiable. Only A experiences A's pain, but others can verify that he has it.

Further papers by Sheldon and Randall are promised in this discussion.

It was noted above that the discussion of naturalism has not been purely academic. Since the beginning of the war and before, naturalism, materialism, and positivism have been strongly attacked as the cause of many of the evils of modern civilization. They are charged with partial responsibility for the breakdown of moral standards and the rise of totalitarianisms. Democracy, it is said, arose out of the Graeco-Roman and Judaeo-Christian traditions, and its preservation depends upon adherence to those traditions. The dignity and worth of man can be maintained only if man has a rational or spiritual nature. Materialism reduces man to a mere animal or a physical mechanism with no peculiar value of his own, and hence has no rational argument against those who wish to use other men as means to their own ends or to liquidate those whom they can not so use. A just social order is possible only if there are absolute and eternal moral laws, grounded in the will of God or the ultimate nature of the universe and disclosed to man through divine revelation or by a supersensible faculty of reason or intuition. The empirical methods of science can not yield such fixed and certain truths, but without such truths moral judgments are subjective and relative, and disagreements in morals are only clashes of varying likes and dislikes which can not be settled rationally. With regard to democracy, it is held that there is no brotherhood of men without the fatherhood of God.

The naturalists have replied that they are not materialists in the popular sense of recognizing only "material" values as opposed to "spiritual" ones. Neither are they reductive materialists. They do not maintain that man is nothing but a brute or a collection of atoms. Man has whatever traits he is discovered by observation to have. His dignity and worth, moreover, can not rest on the hypothetical ascription to him of an immortal soul or a mind which is a non-corporeal substance. Moral values and principles, the dignity and worth of man, have their foundation in human nature and in the connections of human beings with one another in a natural environment. Such values and principles are discoverable by the natural scientific methods of observation, experimentation, and verification. Anti-naturalist philosophies, in their search for supernatural goods and truths superior to those of natural science, neglect natural human goods and the discovery of the natural conditions upon which the attainment of such goods depends. The scientific methods of public verification, moreover, are the only ones suitable for a democracy, for they are the only ones through which intelligent agreement can be reached. The supposed other methods of attaining truth lead to rival absolutisms between which no rational decision is possible. Fascism and Nazism and other modern totalitarianisms are owing, not to the adoption, but to the rejection of scientific method in favor of authoritarianism.

The most immediate practical concern in the conflict of naturalists and anti-naturalists is education. The anti-naturalists maintain that the chief business of the schools is to pass on to new generations the truths embodied in our scientific, philosophical, and religious traditions. The naturalists believe that the schools should be chiefly concerned, not with handing down a body of fixed truths, but with teaching pupils to adopt the scientific attitude of open-minded, empirical, non-dogmatic investigation.

It is to be noted that some scientists, apparently less enamored of scientific method than the naturalistic philosophers, have been among those insisting upon a re-affirmation of the Judaeo-Christian tradition.

Some of those who are not in complete agreement with the naturalists have expressed accord with them in certain fundamental respects. Arthur E. Murphy, in a review of "Naturalism and the Human Spirit" (*Journal of Philosophy,* XLII, 400-417), agrees that there should be complete freedom for rational inquiry in all fields, including the solution of human problems; and he mentions Blanshard and Brightman as idealists who support the unrestricted use of reason. Blanshard, in a paper on "Theology and the Value of the Individual" (in *The Scientific Spirit and Democratic Faith,* Papers from the Conference on the Scientific Spirit and Democratic Faith, 1943, New York, King's Crown Press, 1944), argues strongly against the theological doctrine that the infinite value of the individual rests on his possession of an immortal soul and asserts in conclusion: "The infinite value of the individual must be defined, if at all, in verifiable human terms. To include in it weights and destinies of an imponderable theological kind may lead in the future, as it has too often led in the past, to the destruction of human good."

CONFERENCES

The Conference on Science, Philosophy, and Religion in Their Relation to the Democratic Way of Life, which has held annual meetings since 1940, although it includes representatives of various points of view, has, on the whole, been dominated by the opponents of naturalism. Its most recent volume, containing the papers of the fifth symposium, has the title: *Approaches to National Unity* (New York, Harper, 1945).

The Conference on the Scientific Spirit and Democratic Faith, which held its first meeting in 1943, is sponsored by naturalists and humanists, including philosophers like Murphy and Blanshard, and scientists, educators, and others who would not subscribe to all of the naturalistic philosophy. The papers of its second meeting (1944) have been published under the title: *The Authoritarian Attempt to Capture Education* (New York, King's Crown Press, 1945).

THE FUNCTION OF PHILOSOPHY IN EDUCATION

Some time ago the American Philosophical Association set up a Commission on the Function of Philosophy in American Education, with Professors Brand Blanshard, Curt J. Ducasse, Charles W. Hendel, Arthur E. Murphy, and Max C. Otto as members. The report of this Commission, *Philosophy in American Education: Its Tasks and Opportunities,* appeared late in 1945 (New York, Harper, 319 pp.). It is based on information and statements of opinion secured not only from teachers of philosophy but from teachers in other fields, as well as from government officials, business men, clergymen, writers, and others. Seven two-day regional conferences were held to obtain further evidence. The book has three parts: I. The Contemporary Situation; II. The Task of Philosophy; III. The Teaching of Philosophy—Things That Can Be Done. The third part includes discussions of the various courses in philosophy. It is too early yet to tell what effect this investigation will have.

BERTRAND RUSSELL

Bertrand Russell published *A History of Western Philosophy and Its Connection with Political and Social Circumstances from the Earliest Times to the Present Day* (New York, Simon & Schuster, 1945. xxiii, 895 pp.) which may be mentioned under American philosophy because, according to the Preface, it was "originally designed and partly delivered as lectures at the Barnes Foundation."

The book is a delight to read from its wit and lucidity; it is also full and deep enough to engage the interest of professional philosophers. As the title indicates, passages of general history are inserted throughout the book with a view to showing the connections of the philosophers' doctrines with the political and social circumstances of their times. The book has a further distinction in that the author has critically analyzed and approved or condemned historical doctrines instead of merely exhibiting them as museum pieces. There is a brief concluding chapter on "The Philosophy of Logical Analysis," the school to which Russell himself belongs.

LEADING PUBLICATIONS

B. A. G. Fuller's textbook, *A History of Philosophy,* which delighted many readers in its first edition, has been issued in a revised edition, corrected and improved and partly rewritten (New York, H. Holt, 1945, 2 vols.). In particular, the sections on the Pre-Socratics, on Nietzsche, and on Marxianism have been expanded. The introduction of more sub-headings adds to the usefulness of the book.

Basic Writings of Saint Thomas Aquinas, edited and annotated, with an introduction, by Anton C. Pegis (New York, Random House, 1945, 2 vols.) furnishes to students, in convenient form and at a reasonable cost, the means of making first-hand acquaintance with the thought of this great Catholic philosopher. All of Part I and some sections of Part II of the *Summa Theologica* are included, together with the first 113 chapters of Part III of the *Summa contra Gentiles.* The translation is that of the English Dominicans, with improvements by the editor.

The *Thomistic Bibliography, 1920-1940,* of Vernon J. Bourke (St. Louis, Mo., 1945, Supplement to Vol. XXI of *The Modern Schoolman*) provides a welcome supplement to the *Bibliographie thomiste* of Mandonnet and Destrez. It is a selective bibliography of 312 pages, containing over 4,000 titles listed analytically and a critical introduction on the authenticity and chronology of St. Thomas's works.

The second volume of Santayana's autobiography, *The Middle Span* (*Persons and Places,* Vol. II, New York, Scribner, 1945) carries the account of his life from his graduation from college through his years of teaching at Harvard.

In *A Preface to Logic* (New York, H. Holt, 1945. xi 209 pp.), Morris R. Cohen, that veteran champion of reason, continues to maintain the objective validity and ontologic reference of logic, making the world, in the phrase of the late F. J. E. Woodbridge, a realm of mind, although not without contingent elements. From this point of view he treats the foundations and ultimate subject-matter of logic, propositions, meaning and implication, concepts, the logic of fictions, probability, the statistical view of nature, normative science, and other matters pertaining to logic and its applications. There are some telling criticisms of Logical Positivism, which lately pre-empted the philosophical spotlight. The book is graced by Professor Cohen's usual literary, argumentative, and illustrative skill, aided by his extensive acquaintance with the sciences.

Prof. Charles L. Stevenson of Yale, in a book called *Ethics and Language* (New Haven, Yale Univ. Press, xi, 338 pp.), published at the end of 1944, proposes "to clarify the meaning of the ethical terms," such as "good" and "right," and "to characterize the general methods by which ethical judgments can be proved or supported." He contends that ethical issues differ from those of pure science because they involve disagreement in attitudes as well as in beliefs about matters of fact. Ethical terms, accordingly, have emotive as well as descriptive meaning. Ethical judgments are not simply descriptive but also quasi-imperative or hortatory. They express the attitude of the speaker and attempt to influence the attitude of the hearer. One method of settling ethical disagreements is the rational one of giving reasons for or against ethical judgments, but the reasons adduced serve to confirm or alter attitudes rather than to give strictly logical support. There are also non-rational methods, of which only persuasion is considered.

Ralph Barton Perry, in *Puritanism and Democracy* (New York, Vanguard Press, 1944. xvi, 688 pp.), presents an analysis and a historical survey of these two fundamental elements in our intellectual and institutional heritage, conceiving individualism to be basic in both. The book is not only an earnest expression of faith in American traditions but also a careful exposition and examination of a social, ethical system.

Charles Warren Everett has earned the gratitude of students of Bentham by his excellent edition, with an introduction, of a hitherto unpublished manuscript: *The Limits of Jurisprudence Defined, Being Part Two of An Introduction to the Principles of Morals and Legislation, by Jeremy Bentham, Now First Printed from the Author's Manuscript* (New York, Columbia Univ. Press, 1945. xxii, 358 pp.).

AMERICAN PHILOSOPHICAL ASSOCIATION

The Eastern and Western Divisions of the American Philosophical Assocition accepted the invitation of the Pacific Division to a joint meeting at the University of California at Berkeley, Dec. 27-29, 1945, for the reception of the Seventh Series of Carus Lectures by Prof. Clarence I. Lewis on the "Analysis of Knowledge."

The Eastern Division announced that it would hold its first meeting since 1941 at Sarah Lawrence College, Bronxville, New York, Feb. 21-23, 1946.

ANTHROPOLOGY AND ETHNOLOGY

By Marian W. Smith

Department of Anthropology, Columbia University

GENERAL

Developments in Anthropology and Ethnology were not surveyed for 1943 or 1944, so that the present account covers the last three years of the Second World War. During this time trends in anthropology which had become apparent earlier were intensified. As in other of the sciences, men left their classrooms and research to take up active service with the armed forces. In addition, anthropologists found their services in demand in areas of government research and administration which had not previously employed their aid. Partially, this was owing to particular bodies of information at their command bearing on distant lands and peoples. Partially, and this aspect grew in importance over the three year period, it was owing to the value of certain methods inherent in their discipline and to techniques of field work. Methods for obtaining quick, accurate information on everyday affairs were found to apply as well to Italian and other European peoples as to the hill folk of New Guinea. These methods seem now to be in ever increasing demand for practical application. Administrative work in this country, in Europe, and in Japan claimed a number of anthropologists, and many, especially of the younger members of the profession, accepted permanent posts with government agencies.

ACADEMIC TRENDS

Teaching during the war shifted noticeably from a peacetime role to one geared directly with the war effort. Reconversion has not yet been completed, and it is probable that the effects of war on courses will be felt for some time to come. Interest in the ethnology of the Pacific Islands increased, and many departments added courses on Asiatic peoples to their curricula. The knowledge gained by anthropologists in working in collaboration with the armed forces both at home and abroad also stimulated academic interest in modern European ethnology. The fruits of all of this work will be in the future, but it is clear at the present time that participation in the war led significantly to an extension of the fields academically covered by ethnology and linguistics.

As mentioned in the account for 1942, linguists turned from aboriginal languages to written tongues. The demand for teachers of such languages as Japanese, Kurdish, Fanti, and Pidgin English could not be filled through the ordinary means and was met by employing anthropological linguists. By using native informants and dealing with the language by methods developed for the unwritten languages, the teacher learned with the students, and within a short time a number of experts were available. These methods proved successful, and because they were so widely accepted may prove to have a permanent effect on the teaching of foreign languages.

The extent of government participation in academic training of armed and specialist personnel may be suggested through mention of such programs as the Army Specialized Training Program, the school for Naval Administrators, the Civil Affairs Training School in the Far East, and the School of Overseas Administration. In all of these, anthropologists played their part. Various accelerated curricula in colleges and universities also included anthropology, and the interest shown in the subject, in this period of the triumph of the physical and chemical sciences, was a surprise to anthropologists as well as to administrators. For instance, in the two summer sessions by which Barnard College met the war needs for acceleration, courses in anthropology received next to the largest number of registrants.

The social science trend toward intensive work on modern problems has thus far affected the slant of some anthropological courses but has not changed the basic curriculum.

RACE RELATIONS

Political racism continued to be one of the major targets of many physical anthropologists and ethnologists. Some state universities, such as the University of Minnesota, sponsored programs combating race prejudice without involving anthropology directly. Others, such as the University of Washington, placed their programs in the hands of anthropologists. Much of the work along these lines was done by individuals in extra-curriculum time, and the impetus for the anti-prejudice movement has now passed beyond the control of any scientific group. The popular demand for such material is indicated by the fact that a Civil Affairs Pamphlet, *Races of Mankind,* by Ruth Benedict and Gene Weltfish, sold 42,000 copies in the first year after publication. A film strip has since been made with the book as background and is being widely distributed among children of grammar school age.

FIELD WORK

Field researches in anthropology decreased markedly during the last years of the war. The Carnegie Institution of Washington continued its investigations in the Mayan area of Middle America under the direction of Sol Tax. William N. Fenton of the Bureau of American Ethnology interspersed his war work with field studies of the Iroquois, including those of the Six Nations Reserve, Canada. Research among the Ojibwa Indians, jointly sponsored by Columbia University and the Milwaukee Public Museum, continued with Ernestine Friedl and Robert Ritzenthaler in the field one summer and Victor Barnou the next. Joyce Wike and Leona Steinberg spent seven months with the Indians of Washington and southern British Columbia. Marian W. Smith completed her investigations of Sikhs in this continent by observation of Sikh communities in British Columbia, and in the summer of 1945 Dr. Smith led the Columbia University Field Laboratory. The group investigated the Salish of the middle Fraser River, British Columbia, and consisted of Martin Ackerman, Helen Codere, Robert Hill, Eleanor B. Leacock, Estelle Sillen, students at Columbia, and Joanne Schriver of Vassar College. M. W. Stirling, chief of the Bureau of American Ethnology, continued his archaeological work in southern Mexico under the auspices of the National Geographic Society and the Smithsonian Institution. Frederick Johnson, of the Robert S. Peabody Foundation for Archaeology, made a type survey of interior Alaska. Plans for the speedy renewal of field research are already under way in many institutions.

PUBLICATIONS

Unlike the situation which existed during the First World War, publication did not fall off during the war years. This is particularly striking when taken in contrast with the amount of field work done. The production of trade and semi-trade books was actually stimulated by war demand, all of the existing series and periodicals continued publication and several new journals were instigated. The *Southwestern Journal of Anthropology,* under the editorship of Leslie Spier, accepts articles in all the branches of anthropology. The monograph series of the Viking Fund, known as *Viking Publications,* got under active way, and it also covers all of the fields of anthropological interest. One publication, sections of which will appear over several years, was started by the University of Pennsylvania to cover *Piedras Negras Archaeology* and the University Museum also sponsored a new series of *African Handbooks.* The *International Journal of American Linguistics* renewed publication after a lapse of some years following the death of Franz Boas, and the Linguistic Circle of New York inaugurated a new journal called *Word.*

MUSEUM DISPLAYS

Probably one of the most important war roles for museum displays was that played by the Denver Art Museum. Ethnological displays, entitled "Peoples of the Fighting Fronts," were installed in the various Army camps near Denver and rotated from one camp to the next. Photographs, maps, and objects, with clear labels, were all employed. Each of the displays was accompanied by a descriptive leaflet of general information and by a bibliography of readily available items. The American Museum of Natural History rearranged its Mexican Hall with particular attention both to attractive display and to the accurate arrangement of archaeological horizons. George Neuman, of Indiana University, started a small anthropological museum in the university library.

By far the most important single exhibit of the period is that on "The Art of the Pacific" arranged under the auspices of the Museum of Modern Art, New York, under the direction of Rene d'Harnoncourt, Ralph Linton, and Paul Wingert. This exhibit was opened to the public on Jan. 6, 1946. It deserves mention here as the most significant event in the field of primitive art since the 1941 exhibit of American Indian Art by the same museum, also under the aegis of Rene d'Harnoncourt.

MEETINGS

Regular meetings of the national anthropological organizations were resumed in the latter part of 1945. The American Anthropological Association held its first annual meeting in four years in Philadelphia in December. The Society of Physical Anthropologists met earlier, also in Philadelphia. The American Folklore Society met in joint session with the Modern Language Association in Chicago, and the Society for American Archaeology held several meetings in Washington, D. C. The American Ethnological Society held a special dinner meeting in New York in December, 1944, in conjunction with the required annual business meeting of the American Anthropological Association.

Both the American Ethnological Society and the Anthropological Section of the New York Academy of Sciences held frequent evening meetings throughout the period of the war. The Washington Society was even more active than usual because of the large number of anthropologists present in the city while engaged on war work. The Philadelphia Society and Central Branch also remained active, continuing to hold monthly meetings, and regular meetings were likewise held at centers in Chicago, New Haven, and Cambridge, in various places in California and the Southwest, and in many college anthropological clubs through the country.

The Viking Fund inaugurated a series of dinner meetings which were held first in the Columbia University Faculty Club and later in their own building at 14 East 71 Street, New York. The stimulation of discussion and personal contact possible only at such general meetings were particularly appreciated during the strain of the war years.

PART SEVEN

THE HUMANITIES

DIVISION XXV

LITERATURE AND LANGUAGE

FICTION

By May Lamberton Becker
New York Herald Tribune

GENERAL

If the year's fiction had few high spots, it maintained a general level for which credit should be given in a year of national strains so various, such as ranged from the impact of heavy casualty lists to sudden letdown in the cessation of hostilities and consequent confusions of peace. It was not a year favorable to recollection of the soul in quietness, nor can a year that the public felt, while yet it was new, must be the last of the long strain, be one that holds up with outstretched arms the ideals of endeavor. Preoccupation with strictly home problems was just beginning to show in fiction, having taken firm hold of other fields; humor, that has never really failed us all through our stresses since war began, did not turn sour in victory. It could not be called a year of distinction in our literature, but it provided, in novels, all that could have been expected of it.

WAR NOVELS

The actual war novels gained in dignity by slowing down in production during 1945. One of the best-beloved in this category, John Hersey's *A Bell for Adano,* won the year's Pulitzer award for the best piece of American fiction. This novel had meanwhile repeated its success in the dramatization made of it by Paul Osborn, in which, though all the action takes place in Major Joppolo's office, the main episodes of the book are included.

Glenway Wescott's return to prominence as an author was effected by the strong, thoughtful—and of necessity painful *Apartment in Athens,* which may remain one of the documents of war psychology in fiction, through its study of the strange phenomenon known as Nazi mentality. *Stronger Than Fear,* by Richard Tregaskis, centers in the struggle of an American officer, who is leading his men through a German-held city, against the creeping fear born of battle fatigue. The underground is no longer restricted in books to detective fiction or the middle zone of the spy story. One of the most distinguished novels to speak, in the true French tradition of nothing-too-much, for active and secret French resistance, is *Maquisard,* a brief, pulsing narrative of a wartime Christmas by Albert J. Guerard, Jr., an American officer of French descent, intimately aware of both types of mind. Martha Allbrand's *None Shall Know* is about the underground in Switzerland. *Sowing the Wind,* by Martha Dodd, daughter of our Ambassador to Germany in the early days of the Nazis, is a step-by-step study of progressive decadence in a young German growing up—and going down—with the Party. The sensitive mind of a refugee treats the same subject with dignity and restraint in *The Prisoner,* by Ernst Lothar, but for all its quiet, his determination burns. Lothar's *The Door Opens,* appearing later in the season is of a type whose popularity is strong and increasing, an exquisite evocation of pre-Nazi Vienna and of his own two little girls growing up in it; though keeping to fact, it has the technique of fiction.

The direct personal approach to war continued in novels such as *Beachhead on the Wind,* by Carl Jonas, with Coast Guardsmen and what the war meant to them in the bleak Aleutians. The veteran's return, dealt with from every point of view in non-fiction, motivates *Lights Out,* by Baynard Kendrick, a story of the adjustment to life of a sightless soldier. In MacKinlay Kantor's novel in verse, *Glory for Me,* three soldiers return to their families and the unsettlements of civilian life, while John P. Marquand's slight story of a war marriage even slighter, *Repent in Haste,* and Otto Schrag's *Sons of the Morning,* with the difficulties of a French war bride in a New England village, seem to be forerunners of more to come in this field.

CHARACTER NOVELS

Sinclair Lewis, in *Cass Timberlane,* returned to the Middle West with which he has so often dealt, finding it just the same, showing the same fire, and using the same formula. Booth Tarkington's *Image of Josephine* maintains his standard of character analysis; Alice Tisdale Hobart's *The Peacock Sheds His Tail,* through an international marriage, introduces the American reader to three generations of troubled Mexican life as it affects an aristocratic Catholic family. John Steinbeck's *Cannery Row* moves on the same social level as *Tortilla Flat* and has much the same robust charm. Upton Sinclair's Lanny Budd saga went on in *Dragon Harvest,* where this wealthy undercover man from President Roosevelt is active from the crisis at Munich to the fall of Paris with the German war machine in full blast; there is a general, cumulative interest in these successive novels which might be called historical fiction of today. Edna Ferber's *Great Son* takes in four generations of a Seattle family, with Seattle's story more alive than theirs, from 1851 to Pearl Harbor. Ellen Glasgow, an artist to the last, died as the year was closing; a posthumous volume of Scott Fitzgerald's collected pieces, *The Crack-Up,* came as a reminder of what once was promise.

OF SOCIAL IMPORT

The tremendous force of Richard Wright's *Black Boy* drove it, though an autobiography, straight into the field of the novel, and its native beauty, without attempting to cover the harrowing conditions under which his boyhood was spent, lifts it into literature; it was very widely read and may in all probability be the book most strongly impressing the greatest number of people who read it, and will remember it, this year. *Hunky Johnny,* by Edward Jay Nichols, had also a social import, taking place in the Slovak district of Gary, Ind., and at the University of Chicago. This was a first novel; others of promise were Réné Kuhn's *24 Charlton,* characteristic home life of Greenwich Village; childhood and adolescence in Walter Karig's *Lower Than Angels,* and Stephen Stelcy's *The Cradle Will Fall.* Elizabeth Hardwick's sensitive study of a young girl in *Ghostly Lover,* Ruth Peabody Harnden's ambitious treatment in *Bright Star or Dark* of Irish wartime psychology at the present day; and a Charleston novel by Robert Molloy, *Pride's Way,* centering in two eccentric old ladies and warm with Charleston customs and spirit, are to be noted. The novel of adolescence that created most stir as a work of art was William Maxwell's *The Fallen Leaf,* a study of two boys that proved itself likely to last, while young people in a disturbed family had a sympathetic interpreter in Dan Wickenden's *The Wayfarers.*

Anne Parish's *Poor Child* reveals a slum boy nearly lost by luxury.

ROMANTIC FICTION

The romantic novel of adventure, picaresque, rapidly moving, and always a popular favorite—especially if it runs to a great many pages—was represented earlier in the season by Samuel Shellabarger's *Captain from Castile,* in Mexico and Spain in the sixteenth century, and later on in the year by the sky-rocket success of *The Black Rose,* by Thomas B. Costain, which takes place in the thirteenth century in England and the Orient. It is safe to say that the long, steadily moving pageantry of such fiction will always take on a special value in time of nerve-strain and approaching fatigue, as a calming agent—something the inexperienced would scarcely expect from fiction in which something stirring takes place all the time—but a long way off.

FANTASY AND ADVENTURE

Even fantasy showed its head, though not without some timidity, before the year was over. *The White Tower,* by James Ramsey Ullman, in which six people are on a mountain in Switzerland, has philosophical intent and overtones; Henry Morton Robinson's *The Perfect Round,* though presenting a carrousel and the fortunes of its proprietor and those around him, concerns itself with the merry-go-round as a symbol of struggle between good and evil, and in *High Barbaree,* by Charles B. Nordhoff and J. Norman Hall, which takes the line of development of *Lost Island,* a young navy pilot shot down in mid ocean and seeing his comrade die as they drift, is released by fevered dreams from the anguish and confusion of the present to his past life in Iowa.

A feature of fantasy in 1945 was that age-bars went down, in two cases, between children's literature and that for adults. One of these was a fairy tale for grown-ups by James Thurber, *The White Deer,* which straightway became just as popular with children, and the other, E. B. White's wistful tale of a mouse-man, *Stuart Little,* which though frankly offered as a children's book was caught up at once by their elders. *Focus,* by Arthur Miller, an unusually striking psychological novel, starts from the distortion of vision of a little meek man who should be wearing glasses but fears to do so because, though he is a Gentile, when he wears glasses he looks like a Jew; the handling of his change of heart is expert.

FAMILY-LIFE FICTION

The tendency to merge interests, that has already taken place between the essay and the short story, is now, by reason of the popularity of family-life reminiscences, becoming evident in regard to this sort of book and fiction; we are getting more and more "familiar memoirs" that have deliberate *dichtung* mixed in with their *wahrheit.* The transition is easy; Bellamy Partridge, whose reminiscences of his own background in *Country Lawyer* and *Big Family* endeared him to more than those of his own generation, has written a lively novel with the same sort of atmosphere, *January Thaw,* bringing out the comedy of disputed possession of a Connecticut farmhouse. Louise Andrews Kent, who set her home life to music in *Mrs. Appleyard's Year* and its sequel, adds a touch of burlesque and produces good light fiction —never easy to do well—in *Country Mouse. Party Line* by Louise Baker, preserves the humors of small town telephoning. *Anything Can Happen* by George and Helen Papashvily, is what did happen to them, but the wildest fancy would have trouble in competing with this unpredictable Georgian menage. *The Friendly Persuasion,* by Jessamyn West, is undoubtedly a true picture of what life was like in a Quaker settlement in Indiana, but the interplay of humor and deep religious conviction is managed with the novelist's art in a succession of short stories. *God Bless Our Aunts,* by Rachel Meisenhelder, is taken from the life—not so far back—of an Irish-Pennsylvania-Dutch clan in Pennsylvania, set down by one of its immediate descendants, in the spirit of alarmed hilarity that the actual doings of these dominant relatives did inspire. Another first novel, *Gold in the Streets,* by Mary Vardoulakis—this won the year's Intercollegiate Fiction award made by Dodd, Mead—while not a personal experience, stems from the author's Greek family background and her renewal of national pride by working in Greece.

REGIONAL NOVELS

Regional novels continue, but there has been a pause in the production of those regional historical novels once so frequent, novels so long that if placed end to end they would stretch across the national history, and sometimes produced with no apparent reason save that a particular gap in it had not yet been closed. Descendants of the Mormon pioneers, who have had their place in the sun lately in non-fiction, face the twentieth century in Richard Scowcraft's *Children of the Covenant.*

The flavor of contemporary Charleston, strong in Molloy's novel, is combined with the sparkle of family life in Josephine Pinckney's, which has the characteristic title *Three O'Clock Dinner.* Ralph Fry in *Uncle 'Lish* gets back to the old-fashioned but still chipper generation of salty New Englanders. *Not in Our Stars,* by Josiah E. Greene—a Macmillan Centenary award—takes place on a dairy farm and has a firm word to say on community life.

Pearl Buck's *Portrait of a Marriage* could be called regional, for it is strong in its fidelity to customs and outlook of Pennsylvania German farm-people, but she creates her desired impression of a perfect love between husband and wife by providing evidence that only perfect love could have held them together at all. A sudden success was Ben Ray Redmond's *Rooster Crows for Day,* which took one of his Mississippi river men, river boat and all, to the Congo. Barbara Webster's *Mrs. Heriot's House,* for all its humor, has the shiver that rises at the sight of gradual fascination by something one does not wish or intend to do—and does. *Heartwood,* by Anne Miller Downes, is Vermont through and through. *Skip to My Lou,* by William Martin Camp is about Ozark people lured to the California shipyards. The chicken farm in Betty MacDonald's *The Egg and I* was a real one, but the humor with which she met its difficulties gives it the novel's spirit and popularity. John Gould's *Farmer Takes a Wife* is another example of excursion of experience into print; a Maine farmer takes home a Boston bride. The most important, however, of the books that occupy a position midway between fiction and something else is not a novel, but Louis Bromfield's return to the soil as described and explained in *Pleasant Valley,* together with some autobiography and a good deal about farming as seen through the eyes of one who has been for a long while away from it. *Dayspring,* by Harry Sylvester, is more than regional; a psychological study of the Penitentes, it creates a strong sense of religious conviction leading to conversion.

SHORT STORIES

Short stories included the ten brilliant studies of life in a mountain village south of the border, Josephine Niggli's *Mexican Village*—which could, if desired, also qualify as social documentation; a selection from the work of William March over the period from 1928 to 1944, *Trial Balance,* of which six are new; Edita Morris's thoughtful *Three Who Loved,* romantic tales with a Swedish background; John O'Hara's *Pipe Night,* stories largely from *The New Yorker,* by the author of *Appointment in Samarra;* Robert McLaughlin's *A Short Wait Between Trains,* searching stories of life in Army camps; and Caroline Gordon's *Forest of the South* whose 16 stories are all about that region from the days of the Indians through the Civil War to hunting and fishing of later times. There were interesting examples of two regular annuals, the *Best American Short Stories of 1945* now edited by Martha Foley, and the *O. Henry Memorial*

Award Prize Stories of 1945, edited by Herschel Brickell, and a large and distinctive collection of short stories by Catholic writers, edited by Sister Mariella Gable as *Our Father's House.*

BOOK ON BEST SELLERS

A book came out during the year that without claiming literary merit, will continue to be of direct value in tracing the trends and changes of literary taste over a considerable period; Alice Payne Hackett's *Fifty Years of Best Sellers,* which wastes no time in explaining why they were but tabulates, with brief necessary notes, just what they were. This runs from 1895 to 1945.

POETRY

By August Derleth
Author and Editor

ANTHOLOGIES

Anthologies of poetry in 1945 increased in number over those in 1944, but the number of good anthologies did not vary particularly. The accent was on war in three out of five anthologies worthy of scrutiny. William Rose Benet and Norman Cousins edited *The Poetry of Freedom* (Random House), Oscar Williams, *The War Poets* (John Day), and Richard Eberhart and Selden Rodman, *War and the Poet* (Devin-Adair). Of these, the Williams collection is primarily one of modern poems, such as Williams personally likes. The Eberhart-Rodman anthology is comprehensive, ranging from 1800 B. C. to 1945. The Benet-Cousins book accents the liberal freedom-loving note throughout.

There were many lesser anthologies such as *From the Valleys to the Mountains: Midwest Poetry* (Chaparral Poets Assn.), but few of them contain memorable poetry. Quite the contrary is true of the prose and poetry anthologies competently edited and published, such collections as *Mid-Country,* edited by Lowry C. Wimberly (Univ. of Nebraska Press-Crowell), and *America Is West,* edited by John Flanagan (Univ. of Minnesota Press), contain some very fine regional poems. There was no Moult anthology of "best poems" this year, and apparently the series came to an end with *The Best Poems of 1943,* published in 1944. Perhaps the best anthology of the year is the ably edited Modern Library Giant, *Famous English and American Poetry,* jointly edited by William Rose Benet and Conrad Aiken. This is a carefully compiled anthology which deserves a good public.

SELECTIONS AND COLLECTIONS

Some notable selections and collections by well-known names were published during 1945. Three such selections are outstanding, though not of equal merit. They are the *Collected Poetry of W. H. Auden* (Random House), which is a distinguished volume adequately illustrating the influence of Auden and the roots of that influence; *Selected Poems,* by John Crowe Ransom (Knopf), a remarkable selection all the more striking for its slimness, yet containing all the poems Ransom has thought worthy of preservation; and *Poems 1920-1945,* by David Morton (Knopf), a selection of the poet's best made from his previous books of the last quarter-century, with the addition of many poems never before published in book form.

Other collections and selections deserve the attention of discriminating readers. Marsden Hartley's *Selected Poems,* edited and introduced by Henry W. Wells (Viking), directs attention to a less-known phase of this well-known artist's work. Rafael Alberti's *Selected Poems,* translated by Lloyd Mallan (New Directions), brings together for the first time in English a substantial number of Alberti's work, enough to familiarize the new reader with his work. Similarly, E. J. Pratt's *Collected Poems* (Knopf) presents the best work of a Canadian poet who stands well to the foreground among Dominion poets. *Springboard: Poems, 1941-4* (Random House), is a collection by Louis MacNeice. Others which are worthy of reading include *Collected Poems* of Alfred Kreymborg (Dutton), *Poems New and Selected,* by Richard Eberhart (New Directions), *Three Russian Poets* (Pushkin, Lermontov, and Tyutchev, translated by Vladimir Nabokov), published by New Directions, and *Collected Poems,* by Sylvia Lynd (Cambridge University Press).

LONG NARRATIVE VERSE

Probably the most memorable book-length poem of the year is the long philosophical poem by Robert Frost, *A Masque of Reason* (Holt). Certainly one of the most impressive performances, quite regardless of its unevenness, its great length, and its occasional fumbling, is *Tahl,* by Jeremy Ingalls (Knopf), an epic poem depicting the inner life, as well as the superficial, of a young composer-aviator and his intimates and acquaintances. MacKinlay Kantor's war poem, *Glory for Me* (Coward-McCann) brought to the fore in poetry a name long associated with the current best in prose fiction. Karl Shapiro's *Essay on Rime* (Reynal & Hitchcock), not strictly a narrative poem, is a kind of instructional philosophizing on the art of writing poetry, which, despite many good lines, only underscores the conviction that Shapiro's orthodox short verse is tremendously better—that, in short, he writes it better than he tells how to write it, which is not unusual among creative artists.

George Zabriskie's *Like the Root* (Coward-McCann) is a remarkable philosophical poem exploring the nature of mutability, the idea of cyclic continuity and man's part in it, by a young poet whose first collection some years ago was one of the best first volumes and gave great promise of his future (*The Mind's Geography*). Hermann Broch's poetic novel, *The Death of Virgil,* translated by Jean Starr Untermeyer (Pantheon), has been much touted as a poem, which it was in the original German, and contains many poetic passages in Mrs. Untermeyer's version; whether prose or poetry, *The Death of Virgil* is one of the genuinely important books published in 1945, and one which has far more chance of lasting beyond its time than many another far-more-advertised book.

FIRST BOOKS

Perhaps the most promising among the first books of the year is Byron Herbert Reece's *Ballad of the Bones and Other Poems* (Dutton), with an introduction by Jesse Stuart. This book indicates that Reece has restored balladry to poetry with signal force and impact, for his title poem and his other ballads in the first section of the book are among the best to have appeared in print in the past two decades. The initial collection (Harper) by Gwendolyn Brooks, a young Negress of Chicago, gives evidence of much promise, and so do three other first collections—Loyd Haberly's *Silent Fame and Other Poems* (Macmillan), *Poems,* by Jon Beck Shank (Knopf), and *Soldiers and Strangers,* by Edward Fenton (Macmillan). Two collections are posthumous. Alun Lewis' satiric *Ha! Ha! Among the Trumpets* (Macmillan) contains some of the best war poetry of the recent war; Robert Bhain Campbell's *The Task* (Farrar & Rinehart), gives proof of some promise yet some distance removed from poetic maturity, despite the insistence of the editor.

Certain first collections were prize or contest winners; Charles E. Butler's *Cut Is the Branch* is the Yale Younger Poets book of 1945; Alice Monks Mears' *Brief Enterprise* (Dutton) is the book of the year for the League to Support Poetry. Norman Nicholson's fine *Five Rivers* (Dutton) took a coveted British prize, while Irene Carlisle's *Music By Lamplight* won the Dierkes Press contest and was published by that Press. Also worth reading are *The Invisible Wife and Other Poems,* by Winthrop Bushnell Palmer (Fine Editions Press), *Time Turns Under,* by Florence Crocker Comfort (Decker), and *Country Road,* by Leone Rice Grelle (Macmillan).

NEW VOLUMES BY FAMILIAR POETS

Familiar poets perhaps fared better in 1945 than any other group, very largely because their work struck and held to a consistently higher level than usual. This was true but for a few rare exceptions, perhaps most notably that of William Ellery Leonard, whose *A Man Against Time* (Appleton-Century), published posthumously, was a pathetic sonnet-sequence which stands as a pale performance indeed beside his earlier *Two Lives.* Emily Dickinson's *Bolts of Melody* (Harper), a collection of newly discovered poems, however interesting to the poetry-lover, contains much inferior work, and also some scraps of poems by other hands not apparently recognized by the editors of this volume. Oscar Williams' *That's All That Matters* (Creative Age) is another collection of his highly individual poems; his work continues interesting, but there is an inescapable suggestion that he is beginning to wear thin.

John Malcolm Brinnin's *No Arch, No Triumph* (Knopf), though somewhat more obscure and allusive than earlier books, nevertheless gives every evidence of the poet's growing maturity and stature among his contemporaries. Winfield Townley Scott's *To Marry Strangers* (Crowell) is an uneven collection, containing both, some of his best and some of his least good work, but is still a volume to have and know, since Scott is one of the better younger poets, not affiliated with any poetic *ism* or movement. Randall Jarrell's *Little Friend, Little Friend* (Dial) renews interest in his vivid, modern imagery. Robert P. Tristram Coffin, in *Poems for a Son with Wings* (Macmillan), continues to write in the familiar patterns of Frost, Van Doren, and Coffin, a kind of homely folk verse, not to be confused with the folksy doggerel of Guest *et al.;* the new collection contains many very fine poems, some of which had been better omitted. *The Edge of Night* (Decker) is the second book by August Derleth since the belated appearance of his *Selected Poems* in 1944, and, while repetitive in theme, contains some of his best verse.

C. Day Lewis' *Short Is the Time* (Oxford) is a new volume by one of the leading British contemporary poets; there is some reason to believe that Lewis has hit a level and is not likely to rise much above it; nonetheless, his poetry commands intelligent attention whenever and wherever it appears. Walter de la Mare's new collection, *The Burning Glass* (Viking) is a distinguished book, largely traditional in form, but showing no slackening of skill. Charles Peguy's *God Speaks* (Pantheon) contains some of the most carefully wrought mystic and spiritual poetry of our time, unstudied, vivid in imagery. Charles Henri Ford's *Poems for Painters* (View Editions) is candidly Modernist on the surrealist wing, not very intelligible, labored with obscurities and deliberate, studied eruditions which obfuscate, yet of interest in a challenging and provocative way. It brings up again the question of whether poetry can be considered as meriting attention if it lacks social resonance and is intelligible only to a select few who approach it with guide-books.

Gustav Davidson's *Thirst of the Antelope* (Dierkes) is as forthrightly traditional and pleasing in its evidence of Davidson's quiet talent as Ford's book is modern. Carl Carmer's *Taps Is Not Enough* (Holt) holds promise, but it is not to be considered on the same plane as Carmer's prose. Paul Engle's *American Child* (Random House) is a sensitive and evocative sonnet-sequence in honor of his young daughter, very appreciative of the mental attitudes of the child and at the same time conscious of the psychic bond between parent and offspring. Herbert Read's *A World Within a War* (Harcourt) is a book of poems about the conflict within man in a war-torn world. *The Song of Lazarus,* by Alex Comfort (Viking) is another book which comes to us from abroad, and further proof that the young British poets are singularly vital; Comfort's poems are not orthodox, but neither are they wound about with semantics and obscurantist allusions. Robert Nathan's *The Darkening Meadows* (Knopf) is good minor poetry which many people will read with enjoyment. William Carlos Williams' *The Wedge* (Cummington Press) is typical of his work, but somewhat more weighted with philosophy, and less patently planned poetry, very worth reading. Allen Tate's *The Winter Sea* (Cummington Press) is another distinctive little volume the discriminating reader will want to own, though Tate's poetry is very much *sui generis*.

Other collections of merit include *Poems*, by A. M. Klein (Jewish Publication Society of America); *The Bridge*, by Stanley Burnshaw (Dryden); *Poems MCMXLII*, by William Everson (Untide Press); *Rime, Gentlemen, Please*, by Robert Farren (Sheed & Ward); *A Winter's Journey*, by Richard Hart (Contemporary Poetry); *The Constant Mistress*, by Tom Boggs (Contemporary Poetry); *No Mortal Blow*, by Charles Glenn Wallis (Contemporary Poetry); *Poems*, by Madeline Gleason (Grabhorn Press); *Perilous Balance*, by Arnold Stein (Univ. of Minnesota Press); *Take It to the Hills*, by Zella Price (Humphries); *Crushed for Better Wine*, by Sara Robbins (Philosophical Library).

NEW EDITIONS

Knopf published in 1945 a colorful new edition of William Rose Benet's Pulitzer-Prize poem, *The Dust Which Is God's*, and still another translation of Rilke's poems appeared, *Sonnets to Orpheus and Duino Elegies*, translated by Jessie Lemont (Fine Editions Press). Among handy collections, Louis Untermeyer's *The Pocket Book of Story Poems*, published by Pocket Books, Inc. late in December, is the best.

HISTORY

By Oscar Handlin

Faculty Instructor in Social Science, Harvard University

CONTINUED DEPRESSION IN HISTORICAL STUDIES

Peace brought no immediate prospect of recovery from the depression into which historical studies slumped after 1941. Activities arising from the war that drained away the energies of historians, reduced the meager numbers of graduate students, caused cancellation of the meetings of learned societies, and limited research to materials locally available continued to restrict scholarly endeavors. In 1945, there was again a marked fall in the number of volumes published in this field and, of those which appeared, the most significant were the products of projects initiated before Pearl Harbor.

V-J Day brought a change but no immediate amelioration. The return of scholars to their studies began almost at once, and the universities received the first trickles of a rising stream of candidates for higher degrees eager to resume interrupted careers under the terms of the G-I Bill of Rights. By the end of the year, many institutions found their capacities already strained, and faculties were in process of adjustment to the new tasks of instruction presented by students just out of uniform, many married, most living in crowded quarters, and all beset by problems unknown to earlier generations.

A significant quota of historians remained at work, in and out of the Government, concerned with the gargantuan task of compiling the history of the war and organizing the records of the civilian and military agencies that shared the burdens of the conflict. Most of the publications, that were the outcome of these efforts, have thus far been considered confidential in nature and restricted in circulation. The end of hostilities may bring a more liberal policy, but, in any case, it is too early to estimate the permanent value of these undertakings.

GENERAL WORKS

Bertrand Russell's *History of Western Philosophy* (Simon & Schuster) was American in inspiration if not in the citizenship of its author. This provocative volume surveys the whole sweep of western thought against the background of social and economic conditions. Weak as history and manifesting occasional surprising lacunae in knowledge, it nevertheless abounds in enlightening insights that come from an intelligent understanding of the problems of philosophy. (See "Philosophy," p. 905.)

With this exception, the general works of the year were either texts or surveys. Heinmann's *History of Economic Doctrines* (Oxford) falls into the former category; Owsei Temkin's *Falling Sickness* (Johns Hopkins), a comprehensive history of epilepsy; Norman Taylor's *Cinchona in Java: the Story of Quinine* (Greenberg); *Armament and History* by J. F. C. Fuller (Scribner), and L. K. Anspacher's *Story of Liberty* (Island Press) fall into the second. In *Byways in Quaker History* (Pendle Hill), H. H. Brinton has edited a series of miscellaneous essays.

COLONIAL AMERICA

The high quality of publications in this field compensated somewhat for their fewness in numbers. G. F. Willison's *Saints and Strangers* (Reynal & Hitchcock) is a lucid and informative account of Pilgrim emigration from England and from Holland and of the settlement and development of Plymouth Colony, carefully compiled and written with wit and intelligence. E. L. Raesly's *Portrait of New Netherland* (Columbia) describes the Dutch outpost on the Hudson until the English conquest, drawing heavily on literary sources and emphasizing social aspects. W. T. Baxter's *House of Hancock* (Harvard) analyzes the nature of commercial transactions in Boston in the half-century before the Revolution. Ella Lonn's *Colonial Agents of the Southern Colonies* (North Carolina) is a careful study of the work of these intermediaries.

AMERICAN SOCIAL HISTORY

The field of intellectual history saw the most noteworthy work of the year. *The Age of Jackson* by A. M. Schlesinger, Jr. (Little, Brown) contains a brilliant interpretation of the body of radical ideas that sprang from the discontent of urban artisans in the 1830's. Richard Hofstadter traces the development of *Social Darwinism in American Thought* (University of Pennsylvania) in the half-century after the Civil War. A. A. Ekirch's *Idea of Progress in America* (Columbia) deals with the first half of the Nineteenth Century.

Other aspects of American social history received treatment in H. L. Mencken's Supplement to his *American Language* (Knopf) and B. J. Stern's *American Medical Practice in the Perspective of a Century* (Commonwealth Fund). Albea Godbold's careful study examines the origin of the *Church College of the Old South* (Duke), G. R. Stewart's *Names on the Land* (Random House) is a popular account of place-naming in America, and Volume II of the *Album of American History* (Scribner), edited by J. T. Adams, covers the years from 1783 to 1853.

AMERICAN NATIONALITY GROUPS

A Nation of Nations (Harper) by Louis Adamic is a disappointing attempt to break away from the Anglo-Saxon bias of conventional American historiography. In this case a righteous cause did not salvage a work poorly written and carelessly thought out. In *Foreign Influences in American Life* (Princeton), David F. Bowers has collected a series of essays and bibliographies that comprehends also the influence of the diffusion of ideas. H. W. Pfund's *History of the German Society of Pennsylvania* (the society) covers a career of almost two centuries.

B. A. Botkin's *Lay My Burden Down* (Chicago) is a folk history of slavery sifted from the accounts of surviving bondsmen gathered by the Works Progress Administration. Herbert Aptheker assembled a collection of *Essays in the History of the American Negro* (International).

AMERICAN LOCAL HISTORY

New York State was favored by two excellent works in 1945. Henry Christman's *Tin Horns and Calico* (Holt) is an exciting account of the anti-rent riots in the Hudson Valley, and Blake McKelvey's *Rochester in the Civil War* (Rochester Historical Society) deals with various aspects of the impact of the conflict upon a growing city. Three works touched on local economic history: H. G. Schmidt's *Rural Hunterdon* (Rutgers), an agricultural history of a New Jersey region; William Wilgus' *Role of Transportation in the Development of Vermont* (Vermont Historical Society); and George Marlowe's *Coaching Roads of Old New England* (Macmillan). Other local studies were L. O. Renne's *Lincoln and the Land of the Sangamon* (Chapman & Grimes) and S. C. Williams, *Phases of the History of the Supreme Court of Tennessee* (Watauga Press).

THE AMERICAN WEST

Winifred Kupper's *Golden Hoof* (Knopf) and *Shepherd's Empire* (Oklahoma) by C. W. Towne and E. N. Wentworth deal with sheep-raising in the southwest. Other specialized studies in this field include E. H. Ackerknecht's *Malaria in the Upper Mississippi Valley, 1760-1900* (Johns Hopkins), A. P. Nasatir's *French Activities in California* (Stanford), an archival calendar, W. N. Bischoff's *Jesuits in Old Oregon* (Caxton), and W. D. Wyman's *Wild Horse of the West* (Caxton).

ECONOMIC AND POLITICAL HISTORY

Curtis Garrison's *United States, 1865-1900* (Hayes Foundation) contains a useful survey of current literature. Works in diplomatic and political history include M. E. Loughrey's *France and Rhode Island* (King's Crown), a survey of the period to 1800; *The First Americans in North Africa* (Princeton) by L. B. Wright and J. H. MacLeod, an account of General Eaton's relations with the Barbary pirates; Leo F. Stock's *Consular Relations between the United States and the Papal States* (American Catholic Historical Society); and *United States Naval Academy, the First Hundred Years* (Whittlesey House) by John Crane and J. F. Kieley.

The most important work in economic history was F. A. Shannon's *Farmer's Last Frontier* (Farrar & Rinehart), a penetrating analysis of American agriculture between 1860 and 1897 and fifth volume in a cooperative economic history of the United States. E. C. May's *Principio to Wheeling* (Harper) is a regional study of the steel industry since 1715. *Lumber and Labor* (Farrar & Rinehart) by V. H. Jensen is an account of working conditions and efforts at unionization in a turbulent industry; and E. J. Hadley's *Magic Powder* (Putnam) is a history of cement manufacturing centering about the development of the Universal Atlas Company.

Accounts of America in the Twentieth Century include surveys by Harvey Wish (Harper) and F. R. Dulles (Houghton Mifflin). *The World's Biggest Business* (National Industrial Conference Board) is an analysis of American spending in the last 30 years by P. W. Ellis. Phases of the history of two world wars are touched on in *Indiana Public Opinion and the World War 1914-1917* (Indiana Historical Bureau), *America's Far Eastern Policy* (Macmillan) by T. A. Bisson, and Waverly Root's *Secret History of the War* (Scribner). The problems of peacemaking are the subject of T. A. Bailey's *Woodrow*

Wilson and the Great Betrayal (Macmillan), an account of the struggle for ratification of the Treaty of Versailles in the United States Senate.

THE OTHER AMERICAS

The steady growth of interest in our hemispheric neighbors slackened in wartime, a development marked by a falling off in publication. Works in the history of Canada include B. G. Sack's *History of the Jews in Canada* (Canadian Jewish Congress) and D. D. Calvin's *Saga of the St. Lawrence* (Bruce Humphries), a survey of timber and shipping through more than a century. Of more substantial value was J. B. Brebner's *North Atlantic Triangle* (Yale), an enlightening discussion of the relationships among the United States, England, and Canada.

A somewhat similar topic for the regions to the southward occupies the attention of Harry Bernstein in *Origins of Inter-American Interests, 1700-1812* (Pennsylvania). Y. F. Rennie's *Argentine Republic* (Macmillan) and *Chile: an Economy in Transition* (Macmillan) by P. T. Ellsworth center their interest on recent developments in those nations.

MODERN EUROPE

Cut off from the nourishment of source materials by war, the historians of modern Europe have nevertheless produced a respectable number of valuable contributions. R. L. Schuyler's *Fall of the Old Colonial System* (Oxford) is a discriminating and illuminating account of the growth of free trade policies in Great Britain after 1770. In *England in the Eighteen-Eighties* (Oxford), Helen M. Lynd attempts to trace a turning-point in social development in that decade. Other works in English history include H. G. Hanbury's *English Courts of Law* (Oxford) and A. J. Henderson's *London and the National Government, 1721-42* (Duke), an analysis of the Walpole administration in City politics.

Publications in continental history were sporadic and scattered. For Holland, there was a general history, *Evolution of the Dutch Nation* (Roy) by B. H. M. Vlekke and an excellent special study, Thorsten Sellin's *Pioneering in Penology* (Pennsylvania), a description of the Amsterdam houses of correction in the seventeenth century. Rudolph Heberle's *Democracy to Nazism* (Louisiana State) is a regional study of the development of political parties in Germany. William Salamone's *Italian Democracy in the Making* (Pennsylvania) is an analysis of politics between 1900 and 1914. Works on eastern Europe include the essays collected by B. E. Schmitt in *Poland* (California) and Feliks Gross' *Polish Worker* (Roy).

EUROPE BEFORE THE SEVENTEENTH CENTURY

E. T. Salmon's *History of the Roman World* (Macmillan) covers the period from 30 B. C. to 138 A. D. C. E. Odegaard's *Vassi and Fideles in the Carolingian Empire* (Harvard) is a monograph of considerable scope. Frederic C. Lane's *Andrea Barbarigo—Merchant of Venice* (Johns Hopkins) is an acute examination of business conditions and practices in the early Fifteenth Century. *Renaissance Literary Criticism* (Columbia) by Vernon Hall is particularly concerned with the social context. The first volume of E. M. Morse's *History of Unitarianism* (Harvard) deals with origins in Socinianism and its antecedents.

ASIA AND AFRICA

There is an excellent account of art and civilization in Sirapie Der Nersessian's *Armenia and the Byzantine Empire* (Harvard). B. H. M. Vlekke's *Story of the Dutch East Indies* (Harvard) is written in a more popular vein than his earlier *Nusantara.* Works which seek to explore the historical background of problems now prominent include L. K. Rosinger's *China's Wartime Politics, 1937-1944* (Princeton), *Korea and the Old Orders in Eastern Asia* (Louisiana State) by M. F. Nelson, and J. F. Embree's *Japanese Nation, a Social Survey* (Farrar & Rinehart).

WAR BOOKS

By Kathrine Oliver Murra
General Reference and Bibliography Division, Library of Congress

INTRODUCTORY

The personal narrative represents the bulk of the 1945 output of war books. Those writers who could obtain release from pent-up emotions and tension by recording their experiences seem to have done so. Only in wartime could so many personal narratives find a receptive audience because only in wartime can so many readers identify a particular soldier or pilot, sailor or submariner with the author's experience. Much time and much scarce paper has been used for deploring the lack of literary merit and enduring qualities of these personal narratives. However, it seems as inappropriate to apply the criteria for great literature to war books written during or immediately after the war as to apply them to a newspaper account of a murder. The required essential of literary style is that the writing shall not impede the narrative. The story is important and not the medium or the interpretation of the events narrated. If a personal narrative imparts a feeling of authenticity, tells the story, conveys the picture, be it of men or ships or planes, it is adequately told and serves its chief purpose—that of shortening the distance between battle front and home front. The book itself need not live beyond the year although the tale may some day be a part of the epic literature of the nation. It is not deplorable, therefore, that these personal narratives seldom have the enduring qualities of great literature. Considering the lack of opportunity for distilling emotions through a period of tranquility and the fact that most of the authors are either novices or journalists, the restraint which tempers the record of so many of these narratives is both surprising and commendable.

WAR IN THE AIR

The experiences of some top-ranking aces in Europe from November, 1943 through D-Day, is the subject of *Fighters Up* (Macrae-Smith). *Combat in the Air* (Appleton-Century) is an anthology of the experiences of many able correspondents such as W. L. White and Eric Sevareid.

Two books of air war in the Far East which share the distinction of being informative without being particularly interesting are Alice Rogers Hager's *Wings for the Dragon* (Dodd, Mead); and Hobert Douglas Skidmore's *More Lives Than One* (Houghton Mifflin).

A detailed account of early fighting over New Guinea is *Big Distance* (Duell, Sloan, and Pearce) by Donald Hough and Elliott Arnold. Hugh Cave relates the saga of "Bus" Miller's Liberator squadron sinking 66 Japanese vessels and 15 enemy planes in eight months (*I Took the Sky Road,* Dodd, Mead).

The Air Transport Command is described in prose by Hugh Cave (*Wings Across the World,* Dodd, Mead) and in pictures by Ivan Dimitri (*Flight to Everywhere,* Whitlesey House).

Two Hundred Thousand Flyers: The Story of the Civilian AAF Pilot Training Program (Infantry Journal), self-consciously reviews the splendid work of the Aeronautical Training Society.

Lois and Don Thorburn tell a story of the fighting in the Aleutian Islands in 1942 with the PBY's as heroes and the weather as the villain (*No Tumult, No Shouting,* Holt).

WAR ON THE SEA

One of the most spectacular phases of naval warfare has been the part played by aircraft carriers. A well illustrated general view of carrier action is given by Oliver Jensen in *Carrier War* (Simon and Schuster) covering operations of Task Force 58 including the *Essex* and the *Yorktown.* Typical routine relationships between captain and crew aboard a carrier are illustrated by Morris Markey's story of the *Essex, Well Done!* (Appleton-Century). A vivid account of the gnawing suspense of an entire ship awaiting the return of its pilots from a dangerous mission is told describing the *U. S. S. Lexington,* Vice Admiral Mitscher's flagship, in *Mission Beyond Darkness* (Duell, Sloan, and Pearce).

Fletcher Pratt expertly transmits A. L. Abercrombie's experiences on the *Drayton* in *My Life to the Destroyers* (Holt). The "B" gun crew on the British destroyer *Skye,* participating in the defense of Malta, in 1942, is the protagonist of *Lower Deck* (Macmillan).

The *S. S. Booker T. Washington,* with Negro and white crew members under a Negro captain, and described by the great grandnephew of Harriet Beecher Stowe (*All Brave Sailors,* L. B. Fischer), is unique but proves little as far as race relations in the services go.

The contribution of the Coast Guard is epitomized in an anthology of true stories from many zones of combat (*Sea, Surf, and Hell,* Prentice-Hall).

In *From Omaha to Okinawa* (Dutton), William Bradford Huie continues the swashbuckling description of the miracles performed by the Seabees which he began in *Can Do* (Dutton).

Three volumes personifying ships are: Joseph Leeming's *Brave Ships of World War II* (Nelson); the Cornell Maritime Press' 1038-page Warships *of the World,* a useful supplement to *Jane's Fighting Ships* in less technical form; and a juvenile reference work by Critchell Rimington, *This Is the Navy* (Dodd, Mead).

WAR UNDER THE SEA

The whereabouts of submarines, during the war, were not public information in the press or on the radio to the extent that the less easily concealed actions of surface ships were. Thus, the accounts of these monsters of the deep which can now be told have the added attraction of new information. *Silversides* (Holt) does not have to rely on its "now it can be told" appeal to rate as a top-notch war story. Robert Trumbull, author of *The Raft* (Garden City), has adroitly recorded the daily and nightly routine of this ship which sank 60,000 tons of enemy shipping and is credited with having damaged some 35,000 more.

Like the story *Silversides,* Robert J. Casey's *Battle Below* (Bobbs-Merrill) has been held up by the censors since 1943. In it will be found some of the tall stories of submarine warfare as well as many true ones.

The radioman of *Seawolf,* sister ship of the ill-fated *Squalus,* tells convincingly and without embellishment the story of his ship in *U. S. S. Seawolf* (Putnam).

A different kind of submarine experience, with a single mission overshadowing its war routine, is the story of *H. M. S. Seraph,* which took Gen. Mark Clark to a secret conference with General Giraud in North Africa prior to the invasion (*Secret Mission Submarine,* Ziff-Davis).

EUROPE

The overall picture of war in the ETO is memorably recorded in several accounts which have no more in common than their subject and their semi-pictorial form. John Groth's *Studio Europe* (Vanguard) is an admirable job of bookmaking and combines beautifully written anecdotal narrative with excellent drawings which give it a place in the more permanent records of the war. A cartoonist worthy to rank with Groth in artistic achievement, but of another sort, is Bill Mauldin who has, in *Up Front* (Holt), indelibly defined the life of the infantryman in his sardonic and bitter text and cartoons of dog-faced Willie and Joe. In a lighter vein Dave Breger continues the peregrinations of Private Breger in "GI Joe" (Blue Ribbon).

Superlative reporting with a lightness of touch unhampered by his age and five years of the war in Europe, is that of Robert J. Casey in *This Is Where I Came In* (Bobbs-Merrill). In marked contrast is the report of dogmatic H. V. Kaltenborn who in five weeks developed the theses he took with him to Europe (*Europe Now,* Didier).

The war of intelligence achieved new heights of technical skill and intrigue as Kurt Singer shows in *Spies and Traitors of World War II* (Prentice-Hall).

Reading the collected broadcasts, *From D-Day through Victory in Europe* (Columbia Broadcasting System), detracts nothing from the praise already bestowed on the superior reporting of the radio commentators in this war.

Logistics has been a fascinatingly incomprehensible operation to most civilians so that explanation of the operations of the Services of Supply in *48 Million Tons to Eisenhower* (Infantry Journal) is welcomed.

FRANCE

What happened in occupied France has been clarified by a number of 1945 war books. Gertrude Stein's *Wars I Have Seen* (Random House) is less ephemeral than most war books, partly because it is Stein, partly because it is a better than average Stein, and partly because of the sense of personal participation in daily life in occupied France which it imparts.

The facts revealed by Charles Odic, a Catholic physician in Paris, in *"Stepchildren" of France* (Roy) would be sufficient to sear the mind and heart of any reader without the rhetorical questions and literary ringing of hands which are its embellishment.

Two pictures of the French underground which are similar in incident but dissimilar in handling are David Prosser's discerning *Journey Underground* (Dutton) and Bierne Lay's exciting *I've Had It* (Harper).

Before the French underground was in effective operation, Varian Fry was using every conceivable means which the Emergency Rescue Committee could devise between August, 1940, and September, 1941, to effect the escape of certain known political and intellectual refugees from France (*Surrender on Demand,* Random House).

SPAIN

One explanation of Carlton Hayes' controversial diplomacy in Spain is presented at last in his *Wartime Mission in Spain, 1942-1945* (Macmillan). The role of the exiled Spanish Republicans in the world fight for freedom is stirringly delineated by Isabel de Palencia in *Smouldering Freedom* (Longmans, Green).

MEDITERRANEAN THEATER

Two accounts of getting supplies to Tito's Partisans were published in 1945—Bernstein's *Keep Your Head Down* (Viking) and Louis Huot's *Guns for Tito* (L. B. Fischer).

An American-born, Catholic woman writing under the name of Jane Scrivener reveals much of the daily life in Rome during the German occupation, September, 1943, to June, 1944 (*Inside Rome with the Germans,* Macmillan); and Sylvia Lombroso, an Italian Jewess, describes the plight of scientists and intellectuals in Italy in *No Time for Silence* (Roy).

A friend of Arnaldo Mussolini, son of the Duce, reviews his experiences as a correspondent for *Popolo d' Italia* in Berlin, Moscow, and Stockholm in *In the Wake of the Goose-step* (Ziff-Davis).

GERMANY

Urgent curiosity regarding everyday happenings inside Germany has nettled Allied civilians. One of the most revealing pictures of Nazi government officials just prior to their complete collapse is in the English translation of Count Bernadotte's notes entitled *The Curtain Falls* (Knopf). A collection of Nazi decrees and quotations from German newspapers and broadcasts will be found in Max Seydewitz's *Civil Life in Wartime Germany* (Viking).

Of three records of prisoners of war in Nazi camps, the most objective, illuminating, and informative is Guy Morgan's *P. O. W.* (McGraw-Hill). Lowell Bennett, as a prisoner in the Berlin area from 1943 on, gives some critical impressions of area bombing in *Parachute to Berlin* (Vanguard). Alexander Janta, a Pole masquerading as a Frenchman, writes of the second phase of his captivity in *Bound with Two Chains* (Roy).

Without self-dramatization, a pilot of a British glider recounts his reactions to nine days in German territory in *Arnhem Lift* (Farrar & Rinehart.)

No account of "inside Nazi Germany" is complete without one of the collections of nauseatingly revolting photographs of extermination centers such as *This Must Not Happen Again* (Howell, Soskin).

POLAND

Anna Louise Strong presents the first eye-witness account of an American of the 1943 battle of Warsaw and gives a critique of the new government which will undoubtedly stimulate further controversy. Personal narratives showing commendable restraint and coherence are: Adolf Folkmann, *The Promise Hitler Kept* (Roy); *No Traveler Returns* (Doubleday, Doran), the 1943 battle of the Warsaw ghetto by Henry Shoskes; *Call Us to Witness* (Ziff-Davis), the captivity of two American Methodist missionaries; Ada Halpern's *Conducted Tour* (Sheed and Ward); and Mary Berg's grim four-year diary, *Warsaw Ghetto* (L. B. Fischer).

RUSSIA

The Russian enigma does not lack interpreters. It is probably too much to expect full information and objectivity in reports on this provocative country. Only the tireless searcher after truth who perseveringly reads all accounts and all points of view will achieve anything approximating understanding. For such a seeker the following are suggested: Richard Lauterbach's *These Are the Russians* (Harper); W. L. White's *Report on the Russians* (Harcourt, Brace); Edgar Snow, *The Pattern of Soviet Power* (Random House); David Dallin, *The Real Soviet Russia* (Yale Univ. Press); Ella Winter, *I Saw the Russian People* (Little, Brown); Edmund Stevens, *Russia Is No Riddle* (Greenberg).

MIDDLE EAST

One of the serious and least understood trouble zones of the world is the Middle East. *The Arab Island* by Freya Stark (Knopf) and *Trouble Zone* (Ziff-Davis) by Leon Dennen relate the seething war years to the long and turbulent history of the area.

The colorful but seldom told story of getting supplies to the Russians is the theme of *Persian Gulf Command* (Random House).

PACIFIC ISLANDS

With the waters of the Pacific red with the blood of America's youth from New Guinea to Tokyo, it is to be expected that there should be a deep and personal interest in the battles of the Pacific Islands. Emphasis on the fight against nature in New Guinea is Osmar White's theme in *Green Armour* (Norton). Much of the island warfare is a history of the U. S. Marines as the following list shows: *A Ribbon and a Star* (Holt), the Third Marine Division at Bougainville; *Betio Beachhead* (Putnam); *The Battle of Kwajalein Atoll* (Infantry Journal), experiences of the Seventh Infantry Division; Robert Sherrod's convincing, straight-forward account of the battles of Tarawa, Saipan, Iwo Jima, and the landing at Okinawa in *On to Westward* (Duell, Sloan, and Pearce); and *The U. S. Marines on Iwo Jima* (Dial).

George Tweed's two and one half years' experience dodging the Japanese on Guam is told by Blake Clark in *Robinson Crusoe* (Whittlesey House).

The novelist and former editor of *Fortune,* Green Peyton, reviews amphibious operations in the Pacific in *5,000 Miles Towards Tokyo* (University of Oklahoma Press).

Two fine illustrative volumes of life in the Pacific Islands are Cedric Emanuel's *Southwest Pacific Sketch-*

book (Prentice-Hall), a wartime travelogue of New Guinea by a flight officer of the Royal Australian Air Force, and Tom Lea's limited edition of *Peleliu Landing* (Carl Hertzog).

CHINA-BURMA THEATER

China is no less an enigma than Russia, though for different reasons, and there are as many and as varied interpretations being offered for her as for Russia. Books mentioned here fall into two groups: personal narratives of fighting in China and works on her governments, her peoples, and her problems.

In the first group, Mark Tennien, a Maryknoll Father, vividly relates his experiences in keeping the Catholic missions operating throughout the war (*Chunking Listening Post,* Creative Age Press). Three accounts of prisoners of the Japanese are Quentin Reynolds' *Officially Dead* (Random House), the story of Commander C. D. Smith; Edna Booker's and John Potter's story, *Flight from China* (Macmillan); and Robert S. Ward's searching analysis of Japanese occupation methods in *Asia for the Asiatics* (University of Chicago Press). Contributions to better understanding of China and her problems are: Gunther Stein, *The Challenge of Red China* (McGraw-Hill); Harrison Forman's *Report from Red China* (Holt); Lin Yu-T'ang's somewhat superficial *The Vigil of a Nation* (Day); Pan Chao-Ying, *An Inside Story of China's Long Struggle Against Our Common Enemies* (Revell); Robert Payne's *Forever China* (Dodd, Mead); and Martin C. Yang's *A Chinese Village* (Columbia Univ. Press).

The managing director of the Yunnan-Burma Highway Engineering Administration, in *The Building of the Burma Road* (Whittlesey House), tells one of the most dramatic construction stories in history.

Thomas Healy, a sophisticated Australian journalist on the staff of the *London Daily Mirror,* devotes much of *Tourist Under Fire* (Holt) to the war in Burma.

PHILIPPINE ISLANDS

For persons in a democracy there is something deeply appealing in the stand of Americans and Filipinos within Japanese-occupied territory in the Islands. Each of the stories cited here is thrilling, fast-moving, informative, and generally adequately written: Travis Ingham, *Rendezvous by Submarine* (Doubleday, Doran); Ira Wolfert, *American Guerrilla in the Philippines* (Simon and Schuster); Louise Spencer, *Guerrilla Wife* (Crowell); and Joseph St. John, *Leyte Calling* (Vanguard).

DOCTORS, NURSES, AND THE RED CROSS

Some sardonically merciful trick of fate seems to spur man's knowledge of human reconstruction in the midst of catastrophic destruction. This is shown by the following accounts of the perfection of miraculous new drugs, the development of superb techniques of surgery and care, the invention of new instruments, and the deeper and more successful exploration of therapies for shattered minds: *Doctors at War* (Dutton), edited by Morris Fishbein; *Out of Carnage* (Howell, Soskin); *Men without Guns* (Blakiston), a splendid pictorial history of doctors at war; *Mob 3, a Naval Hospital in a South Sea Jungle* (Bobbs-Merrill); *Air Commando Doc* (Ackerman); *It's Good to Be Alive* (Dodd, Mead); *We Are the Wounded* (Dutton); *G. I. Nightingale* (Norton); *At His Side, the Story of the American Red Cross* (Coward-McCann); and three reports from psychiatrists—John R. Rees, *The Shaping of Psychiatry* (Norton), Abraham Meerloo's *Total War and the Human Mind* (International Universities Press), *Men Under Stress* (Blakiston).

CHAPLAINS

A very human and admirable group of men who have rendered distinctive and courageous service on all battle fronts are the chaplains whose records are set forth in the following: Thomas H. Clare, *Lookin' Eastward,* *a G. I. Salaam to India* (Macmillan); Frederick C. Proehl, *Marching Side by Side, Stories from Lutheran Chaplains* (Concordia Publishing House); Hansel H. Tower, *Fighting the Devil with the Marines* (Dorrance); Christopher Cross, *Soldiers of God* (Dutton); and Archbishop Francis J. Spellman's account of his tour of European battle fronts in *No Greater Love* (Scribner).

HISTORIES

A slim trickle of histories has supplemented the 1945 output of personal narratives: Henry Steele Commager's *The Story of the Second World War* (Little, Brown); Gordon Carroll's *History in the Writing* (Duell, Sloan, and Pearce); Waverly Root's *Secret History of the War* (Scribner); Francis Trevelyan Miller's *History of World War II* (Winston); Edgar McInnis, *The War, Fifth Year* (London, Oxford Univ. Press); and a pictorial review in U. S. Camera for 1945, *The U. S. A. at War* (Duell, Sloan, and Pearce).

GENERAL MARSHALL'S REPORT

The cornerstone of source material for any history of the United States in the Second World War will be, for years to come, Gen. George C. Marshall's penetrating résumé of our participation in that war and his recommendations for an adequate post-war military policy, *The Winning of the War in Europe and the Pacific; Biennial Report of the Chief of Staff of the United States Army* (Simon and Schuster).

BIOGRAPHY

By Malcolm O. Young
Reference Librarian, Princeton University

GENERAL

The popular radio reviewer of books, John T. Frederick, in *The Rotarian* for April 1945 devotes an article to biography and autobiography. He mentions the recent outstanding ones, gives advice on purchase and reading in the field, and makes this statement: "I sometimes think we're living in a 'golden age' of biography. Certainly very many fine biographies and autobiographies are appearing." All this is quite true. The modern biography has little resemblance to the majority of the three-volume chronicles of the 19th century. Especially is this noticeable in the increasingly popular tide here listed as "Informal." The Pulitzer Prize was awarded in May to *George Bancroft: Brahmin Rebel,* by Russel B. Nye, the choice causing some surprise though it was not an unworthy one.

Here we list the few collective works of 1945. Attracting considerable attention was Sheldon Cheney's *Men Who Have Walked with God* (Knopf), the story of seers and saints of all ages. Also published was *In Spite of All* (Abingdon) by Archer Wallace, presenting the lives of ten who overcame handicaps. This number includes, among others, Beethoven, Spinoza, Madame Curie. *The Story of the Great Geologists* (Doubleday), by Carroll L. Fenton and Mildred A. Fenton, is a well balanced volume of science and biography.

PRESIDENTS

A well received and timely book is *Generals in the White House* (Doubleday) by Dorothy and Julius Goebel, Jr., surveying nine of our Chief Executives. Claude G. Bowers has completed, in reverse, his trilogy with *The Young Jefferson, 1743-1789* (Houghton Mifflin) finishing one of the more important biographical works. Another highly rated production is *The Age of Jackson* (Little, Brown) by Arthur M. Schlesinger, Jr., centered, of course, around Andrew Jackson.

A monumental compilation is Jay

Monaghan's *Lincoln Bibliography* (Ill. State Historical Library), listing material published on Lincoln from 1839 to 1939. The same author's *Diplomat in Carpet Slippers* (Bobbs, Merrill) deals with Lincoln's foreign policy. *Intimate Memoirs of Lincoln* (Elmira, N. Y., Primavera Press) is a large volume compiled by Rufus R. Wilson. *A House Dividing* (Springfield, Ill., Abraham Lincoln Association) is concerned with Lincoln as President-elect, by William E. Baringer. A scholarly production is J. G. Randall's *Lincoln the President* (Dodd, Mead), in two volumes, covering the years from Springfield to Gettysburg.

William Howard Taft: Yale Professor of Law and New Haven Citizen (Yale Univ. Press) is by Frederick C. Hicks. The Wilson bibliography is enlarged by several works. H. F. C. Bell has written an analysis in *Woodrow Wilson and the People* (Doubleday). Thomas A. Bailey's *Woodrow Wilson and the Great Betrayal* (Macmillan) is a sequel to his *Woodrow Wilson and the Lost Peace*. Ruth Cranston's *Story of Woodrow Wilson* is a general survey of the subject's whole life.

Very soon after the death of President Roosevelt, appeared *Franklin Delano Roosevelt, A Memorial,* edited by Donald P. Geddes (Pocket Books), later somewhat expanded and published by the Deal Press. *The Real Franklin Delano Roosevelt* (Citadel Press) is a compilation of biography, pictures, and selections of Roosevelt's writings, by Clark Kinnaird. *This Man Truman* (Whittlesey) is by Frank McNaughton and Walter Helmeyer. The President is also the subject of Cyril Clemens' *The Man from Kansas* (International Mark Twain Society).

POLITICAL AND JUDICIAL FIGURES

Seargent S. Prentiss (Louisiana State University Press), by Dallas C. Dickey, is a portrait of the Whig orator of the Old South, lawyer and Congressman from Mississippi. *The Best Is Yet* (Harper) is the autobiography of Morris Ernst, the present day lawyer and reformer. *The Fighting Liberal* (Macmillan) is the apt title of George W. Norris' autobiography. Former Under-Secretary of State, J. M. Huntington Wilson, writes *Memoirs of an Ex-Diplomat* (Bruce Humphries). An appreciative portrait is *Al Smith, American* (Putnam) by Frank Graham. *Chief Justice Stone and the Supreme Court* (Macmillan) is a study by Samuel J. Konefsky.

MILITARY FIGURES

"First with the Most" Forrest (Bobbs, Merrill) by Robert S. Henry, chronicles the career of Gen. Nathan B. Forrest of the Confederate Army. *Fighting Joe Hooker* (Bobbs, Merrill) by Walter H. Hebert, and *War Years with Jeb Stuart* (Scribner) by William W. Blockford, further portray action in the same war. A picturesque character of the Civil War and later, is portrayed by Edgcumb Pinchon: *Dan Sickles* (Doubleday). Still another Civil War personality is the subject of *Belle Boyd; Confederate Spy* (Dietz) by Louis A. Sigaud. *Old Weatherface of the Flying Tigers* (Bobbs, Merrill) by Keith Ayling, is of course, the career of Gen. Claire L. Chennault. Another aviator, Robert Lee Scott, author of *God Is My Co-Pilot,* now writes of his earlier life in *Runaway by the Sun* (Scribner). *Soldier of Democracy* (Doubleday) is the well reviewed record of Gen. Dwight D. Eisenhower, by Kenneth S. Davis.

EDUCATORS, DOCTORS, AND OTHERS

Theodore Maynard has written of Mother Cabrini, recently canonized, in his *Too Small a World* (Bruce). The founder of the Sisters of the Holy Cross in America, Mother Angela Gillespie, is the subject of Anna S. McAllister's *Flame in the Wilderness* (Paterson, N. J., St. Anthony Guild Press). That worker for good, Frances Willard, is portrayed by Mary Earhart (Univ. of Chicago Press). *Music Master of the Middle West* (Univ. of Minnesota Press) by Leola N. Bergmann, presents Frederick B. Christiansen, music teacher and founder of famous choirs. A professor of philosophy, John M. Mecklin, titles the story of his pilgrimage, *My Quest for Freedom* (Scribner). A professor of law, Charles P. Sherman, recalls his career in *Academic Adventures* (New Haven, Tuttle). A stimulating book is by Esther C. Dunn, Professor of English, *Pursuit of Understanding* (Macmillan). *Poor Man's Doctor* (Prentice) by Lewis R. Tryon, carries the reader through his early Pennsylvania days, the First World War, and adventures as a ship's doctor. *Way of an Investigator* (Norton) covers the scientific research of half a century by Walter B. Cannon.

AUTHORS AND THE PRESS

More evidence of the recent interest in Paine is in W. E. Woodward's volume *Tom Paine* (Dutton), in the nature of a defense. Also, the revival of interest in Melville continues in William Ellery Sedgwick's *Herman Melville: The Tragedy of Mind* (Harvard Univ. Press). A biographical and critical essay on Thoreau is *Walden Revisited* (Packard) by George F. Whicher. Emily Dickinson continues to be the center of controversy in Millicent Todd Bingham's *Ancestor's Brocades* (Harper).

North Star Editor (King's Crown) is a sketch of the St. Paul newspaperman, Joseph A. Wheelock, by Richard B. Eide. *A Man from Kansas* (Putnam) by David Hinshaw, is the biography of William Allen White of the *Kansas Star*. *The House of Europe* (Houghton Mifflin) is the story of the newspaperman, Paul Scott Mowrer, and his European travels up to the early '30's.

A very readable book is *American Chronicle* by Ray Stannard Baker, giving light on the muckrakers, and later, on Woodrow Wilson. Linnie M. Wolfe's book, *Son of the Wilderness* extols John Muir, naturalist, conservationist, and writer. Two other westerners have written their reminiscences: Harvey Fergusson in his *House in the West* (Duell) and Marquis James in *The Cherokee Strip* (Viking), a pleasant portrait of an Oklahoma boyhood.

My Wayward Parent (Bobbs, Merrill) is Elizabeth Cobb's informal picture of her father, Irvin S. Cobb. A vivid portrayal of an amazing individual is Samuel Hopkins Adams' *Alexander Woollcott, His Life and His World* (Reynal). Including some of the same group as found in the previous volume is *All Our Lives* (Coward) by Henry Wise Miller, husband of the late Alice Duer Miller. The Canadian poet Robert Service, so well known in the United States, entitled his memoirs *Ploughman of the Moor* (Dodd, Mead).

The Middle Span (Scribner) is the second volume of George Santayana's autobiographical work in progress. *So Far, So Good* (Messner) is a book of genial reminiscences by the New York editor and author, Charles Hanson Towne.

An agreeable sketch of himself and his ancestors is Henry Seidel Canby's *Family History* (Houghton Mifflin). Oliver LaFarge's *Raw Material* (Houghton Mifflin) is a frank self revelation. One of the most talked of books is *Black Boy* (Harper), the earlier memories of Richard Wright.

ACTORS, MUSICIANS, ARTISTS

Joseph Jefferson is the center of *Good Troupers All* (Macrae-Smith), by Gladys Malvern. *Rolling Stone* (Whittlesey) is the good title for Fred Stone's reminiscences. *There Goes an Actor* (Doubleday) is the autobiographical work of Alexander Granach who died during the year. The entertaining Sophie Tucker recalls her past in *Some of These Days* (Doubleday). Another popular volume is *A Star Danced* (Doubleday) by Gertrude Lawrence. Ruth Hunter's *Come Back Tuesday* (Scribner) is an account of a young actress' struggles.

Victor Herbert's life is chronicled by Claire L. Purdy (Messner). Dorothy Caruso presents a worthy picture of her husband in *Enrico Caruso* (Simon & Schuster). *Frank Damrosch* (Duke Univ. Press) is by Lucy B. Stebbins and Richard P. Stebbins. *Bad Boy of Music* (Doubleday) is the title chosen by George Antheil for his recollections.

The 19th century painter, William Sidney Mount, is studied by Bartlett Cowdrey and Hermann W. Williams, Jr. (Columbia Univ. Press). E. A. Burbank and Ernest Royce have collaborated in writing in *Burbank Among the Indians* (Caxton), the painter's life and adventures.

INFORMAL PORTRAITS

This type of writing continues to be popular and incidentally furnishes sidelights on various corners of American life. We can include here *Party Line* (Whittlesey) small town life by Louise Baker. *Jam Yesterday* (Morrow), Kathleen Cannell's story of family life in the '90's. Also, with Pennsylvania as the scene, *God Bless Our Aunts* (Whittlesey) by Rachel Meisenhelder. *The Egg and I* (Lippincott) amusingly reveals life on a Washington poultry ranch, by Betty MacDonald. A picture of an inventor-father and his family is *Wheels in His Head* (Whittlesey) by M. M. Musselman. A Maine sea captain and "character" is vividly drawn in *Uncle 'Lish* (Knopf) by Ralph Frye. Rather more serious is *Country Chronicle* (Duell), the reminiscences of a rural postmaster, Herman Petersen.

FOREIGNERS IN AMERICA

A very early comer from Russia was Demetrius Gallitzin, who arrived in 1792, became a missionary priest in western Pennsylvania, and the subject of a book by Daniel Sargent (Longmans). In 1889 came from Lithuania, Goldie Stone, whose *My Caravan of Years* (Bloch) recalls her philanthropic activities. *This, Too, Shall Pass Away* (Creative Age) is the story of George Rony's flight from Russia and his life here. A pleasant volume is *Anything Can Happen Here* (Harper), the rather informal memories of George and Helen Papashvily, the former an immigrant from Russia. *I Ask You, Ladies and Gentlemen* (Dutton) is the sometimes tragic, sometimes whimsical career of Leon Z. Surmelian, of Armenian origin. Joseph Wechsberg's, *Looking for a Bluebird* (Houghton Mifflin) is a series of sketches descriptive of the author's life in his native Prague and as a new American citizen. In *My American Adventure* (Ives Washburn), Erna Barshack relates her impressions of us since her arrival from Berlin.

MISCELLANEOUS SUBJECTS

The 18th century Pennsylvania frontier is the setting for Paul A. W. Wallace's *Conrad Weiser: Friend of Colonist and Mohawk* (Univ. of Pennsylvania Press). Another bit of Americana is found in *Three Bricks and Three Brothers* (Nantucket Whaling Museum), the story of Joseph Starbuck of the whaling days, written by Will Gardner. North Carolina life from the '50's to the '80's is the background for Kemp P. Battle's *Memoirs of an Old-Time Tar Heel* (Univ. of North Carolina Press). *The Builders of the Bridge* (Harcourt) by D. B. Steinman, concerns John and Washington Roebling. The pioneer of American labor, William Sylvis, is studied by Jonathan Grossman (Columbia Univ. Press). In *Seaman A. Knapp* (Columbia Univ. Press), Joseph C. Barley portrays the 19th century agriculturist educator.

Two figures from the sports are found in Col. Matt J. Winn's reminiscent *Down the Stretch* (Smith & Durrell), and in Margery Miller's *Joe Louis: American* (Current Books).

Pictures on My Wall: A Lifetime in Kansas (Univ. of Kansas Press) is by Florence L. Snow. Life in the Ozarks is pleasantly told by Charlie May Simon in *Straw in the Sun* (Ozarks). Memories of Southern life are well set down in Martha Byrd Porter's *Straight down a Crooked Lane* (Dietz). *Guerrilla Wife* (Crowell) is the narrative of the war years in the Philippines, by Louise R. Spencer. Wanderings as salesman of linotypes are chronicled in Reginald Orcutt's *Merchant of Alphabets* (Doubleday). *No Man Knows My History* (Knopf) by Fawn M. Brodie, is the life of Joseph Smith, the Mormon prophet. *Under Orders* (R. R. Smith) is the spiritual pilgrimage of William

L. Sullivan, formerly a Catholic. Colorful wanderings are narrated by Harry Miller in his *Footloose Fiddler* (Whittlesey). The group concludes with the recollections of a fashionable hair dresser, *Antoine* (Prentice-Hall).

FOREIGN

Milton Waldman's *Elizabeth and Leicester* (Houghton Mifflin) surveys these two individuals and their relationship. The *Life of Edmund Spenser* (Johns Hopkins Univ. Press) is by Alexander C. Judson. Biographical and critical is George Kahrl's *Tobias Smollett, Traveler-Novelist* (University of North Carolina Press). *A Fellow of Infinite Jest* (Prentice-Hall) by Thomas Yoseleff, deals with Lawrence Sterne.

Teresa, or Her Demon Lover (Scribner) is the title which Austin K. Gray chose for his book on Byron's mistress, Countess Guiccioli. A considerably revised edition of Newman I. Whites' *Portrait of Shelley* is published by Knopf, and Robert Metcalf Smith has produced a scholarly book, *The Shelley Tradition* (Scribner). *The Lambs* (Knopf), by Katherine Anthony, tells of Charles and Mary. A needed work is *The Trollopes* (Columbia Univ. Press) by Lucy P. Stebbins and Richard P. Stebbins.

Life and Work of John Tyndall (Macmillan) is by A. S. Eve and C. H. Creasey. Rhoda Truax is author of *Joseph Lister: Father of Modern Medicine* (Bobbs, Merrill). *Victoria through the Looking Glass* (Simon and Schuster), by Florence B. Lennon, is concerned with the versatile Charles Dodgson. *John Henry Newman* (Sheed) is by John Moody. *William Ernest Henley* (Princeton Univ. Press) is by Jerome H. Buckley.

The *Lives of Winston Churchill* is an anecdotal work by John Davenport and C. J. V. Murphy. *This Man from Lebanon* (Knopf) by Barbara Young is the picture of the Syrian mystic poet Gibran. Phil Stong has found a vivid figure in *Marta of Muscovy* (Doubleday), wife of Peter the Great.

Two excellent works are Alfred Einstein's *Mozart, His Character, His Work* (Oxford), and Robert Haven Schauffler's *Florestan* (Holt) which is about Robert Schumann. *William the Silent, Prince of Orange* (Yale) is presented by C. F. Wedgwood. *Voltaire: Man of Justice* (Howell) is by Adolph Meyer.

The Life of the Heart (Harper) is by the popular Frances Winwar, and deals with George Sand and her times. Two other French subjects are found in *Baudelaire* (Princeton Univ. Press) by Joseph D. Bennett, and *The Career of Victor Hugo* (Harvard Univ. Press) by Eliot M. Grant.

The Brazilian crusader for freedom, Ruy Barbosa, is recalled by Charles W. Turner (Abingdon). Two works on Pius XII have appeared, one by Charles H. Doyle (Didier), the other by Kees Van Holk (Philosophical Library). A reverent and well received writing by John Erskine is *The Human Life of Jesus* (Morrow).

TRAVEL

By Kathrine Oliver Murra

General Reference and Bibliography Division, Library of Congress

---

INTRODUCTORY

The wartime trickle of travel books was showing signs of becoming a fair-sized stream by the end of 1945. The major output dealt with regions and waterways of the United States. Several standard series, such as the Rivers of America, added one or more new titles or new editions, and a number of cities were sketched in words or pictures. Many of the books, listed under the subject, "War Books"—Cedric Emanuel's *Southwest Pacific Sketch Book* (Prentice-Hall), for example—might just as correctly have been included here.

NEW ENGLAND

Six different approaches to this region bear witness to its unending charm and rich history. George Marlowe cracks the whip for a present-day journey over the old coaching roads, from Portsmouth to New York, and fills each inn and tavern along the way with folk-lore, history, legend, and anecdote (*Coaching Roads of Old New England,* Macmillan). The lighthouses which dot the coast have yielded Edward Snow a wealth of stories which he shares in *Famous New England Lighthouses* (Yankee Publishing Co.). The heritage of American democracy is traced in another of Erskine Caldwell's series of American Folkways, *Town Meeting Country* (Duell, Sloan, and Pearce) by Clarence Webster.

Three volumes to lure the traveler and the settler to Maine are the humorous, well-written experiences of Helen Hamlin in the deep woods near Churchill (*Nine Mile Bridge,* Norton); the beautiful photographs in *The Nature of Maine* by Marion J. Bradshaw; and a collection of gravure illustrations, *Land of Enchantment; the Penobscot Bay-Mount Desert Region of Maine* (Sugar Ball Press).

MIDDLE ATLANTIC STATES

Two excellent photographic studies of New York City are Weegee's *Naked City* (Essential Books) which portrays the seamier side of "the four million," and Andreas Feininger's *New York* (Ziff-Davis), a well-balanced selection.

According to the enthusiastic author of *Jersey Genesis* (Rutgers Univ. Press) the Mullica River about which he writes is "the most wonderful of the unrecognized rivers of America."

Two books of old houses which are largely pictorial are the volume sponsored by the American Institute of Decorators on *Georgetown Houses of the Federal Period, Washington, D.C., 1780-1830* (Architectural Book Publishing Company) and *Old Dutch Houses of Brooklyn* by Maud Esther Dilliard (R. R. Smith).

THE SOUTH

Two epics from this region have been added to the distinguished Rivers of America series. Blair Niles has revised and enlarged her work on *The James River* published in 1939 to include the Piedmont and Valley regions as well as the Tidewater (*The James from Iron Gate to the Sea,* Farrar & Rinehart). Julia Davis has given the Series the long, thrilling saga of an inland valley in *The Shenandoah* (Farrar & Rinehart).

Further travel in Virginia includes *Mansions of Virginia* (University of North Carolina), and the scholarly *Colonial Churches of Tidewater Virginia* (Whitlet and Shepperson) by George Carrington Mason.

A third edition of Samuel Gaillard Stoney's *Plantations of the Carolina Low Country* (Carolina Art Association), with many fine plates, is more complete for the period 1686-1878 than the first edition published in 1938.

Eldon Roark, columnist of the *Memphis Press-Scimitar,* has brought together in *Memphis Bragabouts* (Whittlesey House) some of the sketches of whimsical, colorful local characters which have adorned his reporting for many years.

Louisiana's lush folklore and history is the subject of two particularly notable volumes. Hartnett T. Kane, who has recorded many aspects of Louisiana life (*Louisiana Hayride*), reconstructs around the crumbling country mansions the life of the grand antebellum days that once were theirs in *Plantation Parade* (Morrow). Lyle Saxon (*La Fitte, the Pirate*) under the auspices of the Louisiana Writers' Program has brought together a truly marvelous collection of folk tales in *Gumbo Ya-Ya* (Houghton Mifflin).

MIDDLE WEST

The major contributions to the descriptive materials of this area are two new titles in The American Lakes Series published by Bobbs-Merrill and edited by Milo M. Quaife. The smallest of the Great Lakes, the poorest in commerce, and the richest in history is Lake Ontario, whose story is ably written for the Series by Arthur Pound. Prof. Harlan Hatcher of Ohio State University gives a scholarly presentation of the history and environs of Lake Erie in another volume for this Series.

The tenth volume in the series, The American Scene, is an anecdotal history, from pioneer times to the present, of the states of Wisconsin and Minnesota entitled *Pine, Stream & Prairie* (Knopf) by James Gray.

The last volume in Rivers of America series is Stanley Vestal's *The Missouri* (Farrar & Rinehart), which captures both the turbulence of the river and the tumult of its valley's history.

A book candidly labeled "a success story," but nonetheless informative and interesting, is Carl Crow's *The City of Flint Grows* (Harper).

The Chicago Tribune columnist, Marguerite Lyon, while describing many local customs in the Ozark Mountains in *Fresh from the Hills* (Bobbs-Merrill), reminds one somewhat of a professional "slummer."

THE WEST

Volume three of the American Mountain Series, edited by Roderick Peattie, is *The Rocky Mountains* (Vanguard) written by Wallace W. Atwood, distinguished geographer and president of Clark University. Another mountain range, whose story is well told by Robert Ormand Case and Victoria Case, is *Last Mountains, the Story of the Cascades* (Doubleday, Doran).

A new edition of the American Guide Series volume for New Mexico has been published by the University of New Mexico Press, the first edition having been published in 1940 by Hastings House.

A delightful travelogue of a state about which there has been too little information is *This Is the Place, Utah* (Knopf) by Maurine Whipple.

Ladd Haystead is a discerning romantic when it comes to the "golden west" of which he writes in *If the Prospect Pleases, the West the Guidebooks Never Mention* (University of Oklahoma Press).

There are three contributions of note for California: Anne B. Fisher's *The Salinas, Upside-down River* (Farrar & Rinehart, the Rivers of America); Gertrude Atherton's *Golden Gate Country* (Duell, Sloan, and Pearce), in Folkways; and Julia Altrocchis *The Old California Trail* (Caxton).

CANADA AND ALASKA

Louisa W. Peat presents a very satisfactory travelogue of wartime Canada in *Canada, New World Power* (McBride).

By all standards the best of a number of travel books on Alaska issued in 1945 is Henry Varnum Poor's *Air Artist Sees Alaska* (Viking) with its beautiful prose and vivid illustrations. The remainder of the Alaska crop is well represented by: Helen Wheaton's *Prekaska's Wife, a Year in the Aleutians* (Dodd, Mead); George Sundborg, *Opportunity in Alaska* (Macmillan); Constance Helmericks, *We Live in Alaska* (Garden City); George L. Hall's *Sometime Again* (Superior Publishing Co.).

THE BRITISH ISLES

Two volumes of more than ordinary importance have been written about parts of Ireland. Robin Flower, distinguished cataloguer of Irish manuscripts in the British Museum, has described the outskirts of Irish culture and folklore in *The Western Island, or the Great Blasket* (Oxford Univ. Press).

In *Lovely Is the Lee* (Dutton), by Robert Gibbings, the folklore, birdlore, fishing spots, and the Galway and Aran Isles are beautifully sketched in prose and drawings.

Travel in wartime England is intermingled with the happy memoir of the philosopher, J. Frank Dobie, in *A Texan in England* (Little, Brown). Fine colored plates illustrate the compilation of six essays on different aspects of country life written by six well-known British authors and edited by W. G. Turner (*A Panorama of Rural England,* Hastings House).

CONTINENTAL EUROPE

Noel Busch (*What Manner of Man,* and *My Unconsidered Judgment*), a correspondent for *Life,* has given a preview of early post-war travel in western Europe and England in *Lost Continent* (Harper).

Of four books on France two collections of photographs are the most satisfactory. The first is Andre Kertesz, *Day of Paris* (Augustin), with wonderful camera studies, and the second is Alexander Frenkley's photographic review of architectural monuments in *Stones of Glory, Stones of France* (International Universities Press). The story of the present-day city of Lourdes is told by Don Sharkey in *After Bernadette* (Bruce). Florence Gilliam, an American who has lived in France for the past 20 years, characterizes the Frenchman and the cultural heritage he offers all other peoples (*France,* Dutton).

Maurice Hindus has added another volume to his long list of discerning portraits of aspects of Russian life and Russian people in *The Cossacks* (Doubleday, Doran).

AFRICA AND THE FAR EAST

André Cauvin, the Belgian photographer who illustrates John Latouche's *Congo* (Duell, Sloan, and Pearce), has done for it an unusually fine piece of work. Eslanda Goode Robeson, wife of Paul Robeson, describes her experiences in South Africa, Kenya, Uganda, and the Congo in 1936 when she undertook to explore the primitive minds of members of her race in their native habitat (*African Journey,* Day). The prolific Attilio Gatti has this year written *South of the Sahara* (McBride). Another of J. J. Augustin's fine books in *Egypt,* a tour of the antiquities of the country, by George Steindorff with photographs by Hoyningen-Huene.

Santha Rama Rau, a young American-educated Brahman girl, charmingly and penetratingly tells of rediscovering her native land in *Home to India* (Harper). A little handbook intended to interpret India to outsiders is *The Land and the People of India* by Manorama R. Modak (Lippincott). Ernest Rathenau has photographed many peoples of the Far East, and Horst edited a collection of these photographs in *Orientals* (Augustin).

ISLANDS OF THE PACIFIC

A North American edition of R. W. Robson's valuable *Pacific Islands Handbook* has been published by Macmillan and represents a complete revision of the Australian editions.

The distinguished anthropologist, Felix M. Keesing, in revising his *The South Seas in the Modern World* (Day), has given particular attention to the effect of Japanese and Allied occupations of the Islands. Another anthropologist, Fay-Cooper Cole, has written *The Peoples of Malaysia* (Van Nostrand) which, in addition to scientific data, contains much on the life and customs of the natives today.

Stanley D. Portens describes the people, natural phenomena, and current problems of Hawaii in *Calabashes and Kings* (Pacific Books Publisher).

SOUTH AMERICA

Roland Hall Sharp has mingled politics and travel rather well in *South America Uncensored* (Longmans, Green) which he calls "a continent in search of frontiers." Peter Masten Dunne, of the University of San Francisco, stresses the importance of a knowledge of the Catholic tradition in Latin America for a better understanding of its problems in *A Padre Views South America* (Bruce). *Hasta la Vista* (Greenberg) is the brief record of a tour of 20,000 miles on the continent, including the major cities.

Botanical wanderings through the "orchid of the tropics" is the subject for a fascinating book with many fine plates by Milford and Racine Foster (*Brazil,* Cattell). Alice Rogers Hager, well-known newspaperwoman, and Jackie Martin, the photographer, have also told the story of *Brazil, Giant to the South* (Macmillan).

An amusing and detailed sketch of family life and customs in Venezuela is Olga Briceño's *Cocks and Bulls in Caracas* (Houghton, Mifflin).

BERMUDA AND CUBA

The eighth edition of the standard guide to Bermuda, *Beautiful Bermuda* (Bell), has just been published. Thomas Barbour, Custodian of the Harvard Biological Station and Botanical Garden at Soledad, Cuba, has interspersed general impressions of the scenery with more detailed information on the flowers, birds and animals in *A Naturalist in Cuba* (Little, Brown).

MEXICO

Frances Toor has combined material from her two earlier guides and brought all the information up to date as of 1944 in *New Guide to Mexico* (Crown). A photographic tour is provided by Fritz Heule in *Mexico* (Ziff-Davis). Cora M. Oneal describes *Gardens and Homes of Mexico* (Banks, Upshaw). How to set up housekeeping in Ajijic is delightfully told by Dane Chandos in *Village in the Sun* (Putnam). Maurice Hudson tells, without verve or sparkle, of *Mexico, Yesterday, Today, Tomorrow* (Dorrance).

CRITICISM AND BELLES LETTRES

By May Lamberton Becker
New York Herald Tribune

THE BRONTËS

Late in the year came an unexpected and distinguished contribution to our literary criticism, *Charlotte and Emily: The Brontës,* by Laura L. Hinkley, which with searching discernment marshalled before students of Brontë literature and the wider public of those who have invariably found anything about the Brontës exciting, all the evidence, conflicting as it has been, tending to establish a connection between the inner and outer lives of the four Brontës and the literature they left behind them. In this much needed assessment anything even approaching surmise is plainly so stated; this is the sort of vital scholarship greatly needed, especially in the case of the Brontë family genius.

SANTAYANA

George Santayana's *The Middle Span,* second volume of his autobiography begun in *Persons and Places* in 1944, covers his years in Germany as a student, his early visits to his beloved England, his returns to Spain as a young man, and his 30 years as teacher at Harvard. Figuring in these reminiscences are finely drawn portraits of personages in the academic world and in that of American literature.

HENRY JAMES

The recrudescence of interest in Henry James was heartily maintained. Critical discussion as in *Henry James: the Major Phase,* by Francis Otto Matthiessen, a monograph published late in 1944, gathered momentum in 1945, and the documentation of the movement was increased by *The Question of Henry James,* edited by F. W. Dupee, 26 of the most respected critical opinions of this widely discussed writer, including essays by T. S. Eliot, Van Wyck Brooks, Edmund Wilson, Max Beerbohm, André Gide, Joseph Conrad, and 20 others, and forming an excellent adjunct to the process of reappraisal now going on. A chronological selection of the *Short Stories of Henry James* from 1877 to 1909, was edited by Clifton Fadiman.

SCHUMANN

Robert Haven Schauffler's *Florestan* did for the music of Robert Schumann much the same sort of work of grace that Miss Hinkley did for the Brontës, in blending it so completely with his life that it can not fall out of his biography.

SCIENCE

A Grammar of Motives, by Kenneth Burke, approached the re-examination of semantics with fresh vitality, considering the subject in terms of drama rather than those of science by a method he calls "dramatism." The crash of the atomic bomb into world consciousness and the conscience of the world brought out one of the year's most distinguished editorials in the *Saturday Review of Literature,* "Modern Man is Obsolete," by Norman Cousins, later enlarged and published in book form.

BARZUN AND RILKE

Teacher in America, by Jacques Barzun, leaped the barriers of educational literature and gave the nation a thorough-going treatise on teaching as conducted in this country. Its wit, sagacity, and general brilliance put it in a class by itself. *The Letters of Rainer Maria Rilke, 1892-1910* was translated by Jane Bannard Green and M. D. Herter Norton.

THACKERAY AND TROLLOPE

The first two of a four-volume set of *The Letters and Private Papers of William Makepeace Thackeray,* edited by Gordon L. Ray, came out in a beautiful edition with reproductions of Thackeray's drawings and manuscripts. Lucy Poate Stebbins and Richard Poate Stebbins, a mother-and-son combination of biographers, brought off a group treatment of all writers, important and otherwise, of a noted writing family, in *The Trollopes.*

SHELLEY

The Shelley Legend, by Robert Metcalf Smith in collaboration with Martha M. Schlegel, T. G. Ehrsam and L. A. Waters, came as a carefully documented effort to do away with the reputation of Shelley as a "Victorian angel"—a reputation that some may think not so firmly entrenched as to require so much energy for its dislodgment.

EMILY DICKINSON

The major sensation in poetry, not only of the year but for some years past, was provided by the emergence from the guardianship of Mabel Loomis Todd and her daughter, Millicent Todd Bingham, of more than 650 hitherto unpublished poems by Emily Dickinson, gathered as *Bolts of Melody,* together with Mrs. Bingham's account in *Ancestors' Brocades* of the complicated and little-known conditions of "the literary debut of Emily Dickinson."

WAR-EXPERIENCE LITERATURE

The distinctive literature of war-experience belongs rather to history than to the department of literature, but in the cartoons of William Henry Mauldin, created, with his interpretative text, in *Up Front,* a link between *belles lettres* and the public whose reading is chiefly accomplished through the newspapers is admirably accomplished; nothing that the war has given us in reports from actual participation, save the heartfelt, homely letters home to the American heart written by Ernie Pyle, has made quite the impression on the country at large than the drawings, so bitter and so loving, of Mauldin's disillusioned dogface heroes Joe and Willie.

MENCKEN AND CARL VAN DOREN

A major event was the appearance of *Supplement One to the American Language,* Henry L. Mencken's rich, witty, widely welcome contribution to a subject to which he has devoted his talents and his time over a long period. A monumental work of scholarship was accomplished by Carl Van Doren in the editing of *Benjamin Franklin's Autobiographical Writings* beyond the familiar *Autobiography,* so as to tell the whole story of his versatile life.

HISTORICAL RESEARCH FIELD

In the field of historical research a distinguished contribution was also made to *belles lettres* by the presentation, in *My Heart and My Head* by Helen Dupuy Bullock, of the "little history of Thomas Jefferson and

Maria Cosway," based on hitherto unpublished letters of Jefferson to the beautiful, devout, and married musician, composer, and artist whose pictures and portraits adorn the volume. These 25 missing letters, breathing a devotion of the utmost propriety, were found in the estate of the attorney of Jefferson's grandson and executor, and here are woven into the narrative of that long friendship, one that was distant only in the geographical sense.

NATURAL HISTORY

As usual, natural history contributed to pure literature more than one example, the outstanding ones being *The Lost Woods,* adventures of Edwin Way Teale with many different creatures in many different places and with the changes nature makes in her own scenery—a text of which the photographs of Teale form an integral part—and a centennial tribute to Henry D. Thoreau by George F. Whicher, *Walden Revisited,* a full-length critical portrait in pages as few as Thoreau himself would have preferred for terseness, and the opening comment that though Walden Pond is preserved as a state reservation, it is no longer a refuge of the spirit.

ENGLISH LANGUAGE AND LITERATURE

By Donald Nelson Koster
Department of English, University of Pennsylvania

GENERAL

The year 1945 saw the cessation of hostilities in both Europe and the Far East, and thus many shortages that had existed for American civilians were either eased or eliminated. Paper and newsprint, however, continued to be in short supply, with the result that many manuscripts which otherwise would have been printed have remained on publishers' shelves or on authors' desks. Nevertheless, the year was, from the standpoint of published scholarly works in the field of English Language and Literature, more productive than the preceding year, and 1944 was not what might be termed a "slim" year.

The survey here presented is, like its predecessors, necessarily limited by the demands of space; therefore, many brief or extremely technical items are not mentioned. A complete list of such contributions will be found in due time in the Supplement to the *Publications of the Modern Language Association (PMLA).** The present article furthermore is mainly restricted to a consideration of work which has been published in the United States.

ENGLISH LANGUAGE

Linguistic Bibliography.—S. N. Trevino prepared a bibliography of phonetics (*AS*) and Joseph Jones did likewise for present-day English (*AS*). Elliott V. K. Dobbie continued his "General and Historical Studies" (*AS*), while Kemp Malone in "Some Linguistic Studies of 1941-1944" (*MLN*) commented critically upon important work in the field.

American English.—The year saw the publication of *The American Language: Supplement I,* by H. L. Mencken (Knopf). The first in a proposed series of supplements to the author's monumental work, *The American Language,* this volume is in itself a 739-page compendium of timely information on the state of the Union's language. Ramon F. Adams' *Western Words* (Oklahoma), a sequel to the same writer's *Cowboy Lingo,* may be best described as a dictionary of the range, cow camp, and trail. In "Du Pratz's *History of Louisiana* (1763), A Source of Americanisms, Especially of Those Attributed to Imlay" (*AS*), John T. Krumpelmann produces evidence that the third edition of Imlay's *Topographical Description* borrowed freely from the anonymous English translation of du Pratz's *Histoire,* which thus gives earlier occurrences of Imlay's words than those cited in the DAE. Steven T. Byington contributed the third in his series of "Mr. Byington's Brief Case" (*AS*), considering miscellaneous matters connected with American English, and A. R. Dunlap's "Observations on American Colloquial Idiom" (*AS*) discusses *any more, at all, off of,* and other idioms.

---

* Periodicals are cited under the following abbreviations, the reference being always to the volume for the year covered by this review: PMLA, *Publications of the Modern Language Association of America;* JEGP, *Journal of English and Germanic Philology;* ELH, *English Literary History;* HLQ, *Huntington Library Quarterly;* MLQ, *Modern Language Quarterly;* MLN, *Modern Language Notes;* JHI, *Journal of the History of Ideas;* AS, *American Speech;* ASch, *The American Scholar;* KR, *The Kenyon Review,* CW, *The Catholic World;* CE, *College English;* SRL, *The Saturday Review of Literature.* Titles of books are followed by the name of the publisher or press printing the book.

Words and Terms.—Ivor Brown's *A Word in Your Ear and Just Another Word* (Dutton) is a delightful little volume, combining Brown's earlier anthology of words that interest him with his more recent one. The effect of maritime phrases on the landsman's language is traced by Joanna Carver Colcord in an interesting study entitled *Sea Language Comes Ashore* (Cornell Maritime Press). In "The Word Harvest of '44" (*SRL*) Walker Allen Read provides a colorful inventory of the words and expressions born in 1944, and I. Willis Russell browses "Among the New Words" (*AS*). Robert H. Welker in "G. I. Jargon: Its Perils and Pitfalls" (*SRL*) issues a warning to authors to examine carefully the language the soldiers thought and wrote in so that their novels, poems, and plays may be authentic, while Eric H. Partridge examines the slang of the R.A.F. in "Words Get Their Wings" (*CE*).

Basic English.—The year brought the publication of two new books on this subject: *Learning Basic English* (Norton) by I. A. Richards and Christine Gibson, and *Handbook of Basic English* (Appleton-Century) by Tom Burns Haber. The first is a practical handbook for English-speaking people and takes up the various important uses to which Basic English can be put; it is, on the whole, an excellent exposition of the subject. The second is a workmanlike attempt to present a complete condensed description of Basic. A third book which dealt in part with the topic was Winston S. Churchill's *The Dawn of Liberation* (Little, Brown), a collection of the former Prime Minister's speeches, messages, and broadcasts for 1944. Included is Churchill's statement to the House of Commons on March 9, 1944, concerning Basic English. In it Churchill indicates the steps taken by the British Government to develop Basic English as "an auxiliary international and administrative language."

Vocabulary.—J. H. Neumann contributes two items, "The Dutch Element in the Vocabulary of American English" (*JEGP*), and "American Newspaper Interest in English Language Problems" (*AS*), while James B. McMillan in "New American Lexical Evidence" (*AS*) lists 95 words and combinations "intended to supplement the evidence provided in the DAE."

OLD ENGLISH

Although numerous minor items were contributed, particularly to *MLN*, there was little work of substantial dimensions published in the Old English field in 1945. Noteworthy were two *PMLA* papers by Sherman M. Kuhn and W. H. French. In "*E* and *AE* in Farman's Mercian Glosses," Kuhn presented the evidence relating to Farman's uses of *e* and *ae* in accented syllables and a sampling of the uses in unaccented syllables; he then endeavored to explain each usage in the light of modern scholarship. French, in "*Widsith* and the Scop," advanced the theory that the *Widsith*-poet was a scop, whose "ultimate aim in composing the poem or in reciting it subsequently was to interest a patron in supporting him."

MIDDLE ENGLISH

The year 1945 saw the second printing of a work that had appeared first ten years earlier: the modern English rendition by Henry W. Wells of William Langland's *The Vision of Piers Plowman* (Sheed and Ward). Coolidge Otis Chapman concluded, in his "Virgil and the *Gawain*-Poet" (*PMLA*), that the author of *Sir Gawain and the Green Knight* was a reader of the *Aeneid.*

There were several Chaucer items. Margaret Galway in "Chaucer's Hopeless Love" (*MLN*) argued in support of the identification of the lady alluded to in the poem to the *Book of the Duchess* with Joan of Kent. B. J. Whiting in "'By My Fader Soule' (*CT,* II (B), 1178)" (*JEGP*) cited numerous parallels to the oath in the Man of Law's end-link to show: (1) that "while it was more common to swear by the soul of a dead parent, it was possible to swear by that of one still living," and (2) that in the two centuries after Chaucer "it was reserved for comic scenes and was used only by low, vulgar or rustic characters." In "Action at Actium—An Alliterative Crux in Chaucer (*He poureth pesen upon the haches slidere—LGW* 648)" (*JEGP*), Roland M. Smith suggested "either that (1) Chaucer misread *peires, peres,* or *pieres* (= "stones") in his MS. source as *peises,* or that (2) he found already in his source the form *peises* (= "weights"), which he understood as the analogical *S*—plural equivalent to the more usual *pesen,* and thereupon changed it to *pesen.*" Johnstone Parr presented evidence in "The Date and Revision of Chaucer's *Knight's Tale*" (*PMLA*) that there was much more revision of the tale than has been hitherto acknowledged and that the date of this revision was probably after the middle of 1390. In "Alice Chaucer and Her Husbands" (*PMLA*), Marjorie Anderson added weight to the theory that Alice Chaucer was the granddaughter of the celebrated Geoffrey.

FIFTEENTH CENTURY

Francis Lee Utley's "When Nettles in Winter Bring Forth Roses Red" (*PMLA*) traces the evolution of the fifteenth-century lying-song which advises us to trust women only when nettles bear roses and other wild impossibilities come to pass. Marshall W. Stearns continued his work on the Scottish Chaucerian, Robert Henryson, with the publication of *A Modernization of Robert Henryson's "Testament of Cresseid," with an Introduction and Notes* (Indiana) and "Henryson and Chaucer" (*MLQ*), a detailed study of the relationship of Henryson's *Testament of Cresseid* to *Troilus and Criseyde.*

EARLY TUDOR

Vernon Hall's *Renaissance Literary Criticism: A Study of Its Social Content* (Columbia) is an exposition of the belief that Renaissance literary theory and criticism were upper-class and dictated chiefly by socio-political motives. In "More Sources of Rastell's *Interlude of the Four Elements*" (*PMLA*), *Johnstone Parr* examines further source-material for Rastell's cosmology, natural history, and geography. Elizabeth T. Hastings provides a collation of the printed text of a 1549 sermon of Bishop Latimer with a newly discovered translation of it in "A Sixteenth Century Manuscript Translation of Latimer's *First Sermon Before Edward*" (*PMLA*).

AGE OF ELIZABETH

George Chapman's view of man as "split by the Platonic dichotomy between sense and intellect" is derived from Hellenistic philosophy rather than from Christian orthodoxy, according to Roy W. Battenhouse's "Chapman and the Nature of Man" (*ELH*). "Marlowe's 'Imperiall Heaven'" (*ELH*), by Francis R. Johnson, explores Renaissance ideas of cosmology underlying the dramatist's use of this phrase, while Allan Holaday's "Robert Browne and the Date of Heywood's *Lucrece*" (*JEGP*) sets forth the viewpoint that the play was written in 1594 and later revised. Eugene M. Waith's "A Tragicomedy of Humors: Fletcher's *The Loyal Subject"* (*MLQ*) treats of Fletcher's use and modification of the Jonsonian principle of "humors" in character delineation, and Johnstone Parr's "The Horoscope in Webster's *The Duchess of Malfi"* (*PLMA*) concludes that the playwright produced a purely hypothetical horoscope to suit the dramatic purposes of his play. A. Philip McMahon's "Francis Bacon's Essay *Of Beauty"* (*PMLA*) is an attempt to clarify the meaning of the essay through a close study of its sources.

A minute examination of the poetry of Ben Jonson was made by George B. Johnston in his *Ben Jonson: Poet* (Columbia Univ. Studies in English and Comparative Literature #162), and Herbert H. Umbach undertook a full analysis of the "metaphysical" devices used by John Donne in his sermons, concluding in "The Merit of Metaphysical Style in Donne's Easter Sermons" (*ELH*) that Donne, "considered in the context of his times," was not an extremist in this regard. In "The Murdered Substitute Tale" (*MLQ*), Ernest G. Mathews traced the seventeenth century history of the source of the substitute bride episode in *The Changeling*, while Herbert Weissinger in "The Seventeenth-Century Reputation of the Elizabethans" (*MLQ*) found "a continuous tradition of appreciation of the work of the Elizabethans."

SPENSER

The most considerable work of 1945 on Spenser was Alexander C. Judson's biography of the poet, *The Life of Edmund Spenser* (Johns Hopkins). There were several articles. Mark Eccles wrote "Elizabethan Edmund Spenser" (*MLQ*), in which he listed all known bearers of the name and concluded that the poet is in all probability the Edmund Spenser who married Machabyas Chylde on Oct. 27, 1579. That Spenser's treatment of savages illustrates his idea that the good life can be achieved only by man's realizing fully one's own nature as a rational animal is the thesis of Roy H. Pearce in "Primitivistic Ideas in the *Faerie Queene"* (*JEGP*). John E. Hankins in "Spenser and the Revelation of St. John" (*PMLA*) illustrates the biblical influences on Book I of Spenser's great work, and Kerby Neill in "Spenser's Acrasia and Mary, Queen of Scots" (*PMLA*) provides further evidence that the poet may have represented Mary Stuart allegorically in the character of Acrasia.

SHAKESPEARE

The year was productive of several books dealing with Shakespearian scholarship: *Shakespearian Comedy and Other Studies* (Oxford) by George Gordon, a collection of essays by the late Professor Gordon originally delivered as lectures at Oxford and Cambridge; *Shakespeare and the Popular Dramatic Tradition* (Duke) by S. L. Bethell; *Shakespeare and Johnson* (Chicago) by Gerald Eades Bentley; and *The True Text of "King Lear"* (Johns Hopkins) by Leo Kirschbaum. The latter author also wrote "The Origin of the Bad Quartos" (*PMLA*), in which he advanced the theory that the bad texts were produced by memorizing the good texts in theatrical manuscripts rather than by memorizing performance.

Robert Adger Law in *"Richard the Third:* A Study in Shakespeare's Composition" (*PMLA*) suggests the probability that the first act was conceived after most of the plot had been planned and shaped up, while Fred Manning Smith in "The Relation of *Macbeth* to *Richard the Third"* (*PMLA*) believes that Shakespeare used not only Holinshed but also his own earlier play in evolving his *Macbeth.* In "Shakespeare and Apleius" (*PMLA*) D. T. Starnes reveals the influence of Shakespeare's reading of *The Golden Ass* upon his work. Dorothy Bethurum, in "Shakespeare's Comment on Medieval Romance in *A Midsummer Night's Dream"* (*MLN*), contends that the play "was conceived in the spirit of parody on medieval romance" and that the influence of Chaucer's *The Knight's Tale* is greater than is usually supposed. Brents Stirling, in "Shakespeare's Mob Scenes: A Reinterpretation" (*HLQ*), studies these scenes against the background of anti-popular propaganda to be found in the popular literature, official documents, and published sermons of the times. Willa McClung Evans' "Shakespeare's 'Harke Harke Ye Larke'" (*PMLA*) introduces a variant of the song-text, while John W. Draper studies "The Tempo of Shylock's Speech" (*JEGP*). Articles growing out of recent Shakespearian productions are Paul Robeson's "Some Reflections on *Othello* and the Nature of Our Time" (*ASch*) and Oscar J. Campbell's analysis of "Miss Webster and *The Tempest*" (*ASch*).

Rupert Taylor's "Shakespeare's Cousin, Thomas Greene, and His Kin: Possible Light on the Shakespeare Family Background" (*PMLA*) suggests a kinship between the dramatist and Thomas Greene, solicitor, steward, and town clerk of Stratford-on-Avon from 1603 to 1617.

SEVENTEENTH CENTURY

An early text, recently discovered, of the Lovelace sonnet beginning "When I by thy faire shape did sweare" is analyzed by Willa McClung Evans in "An Early Lovelace Text" (*PMLA*), while Allen R. Benham in "Sir John Suckling, *A Sessions of the Poets: Some Notes and Queries*" (*MLQ*) speculates on possible candidates for the laureateship mentioned and not mentioned by Suckling. Michael F. Moloney's "Richard Crashaw" (*CW*) is an appreciation of Crashaw's poetry, and John L. Lievsay's "Tuvill's Advancement of Bacon's Learning" (*HLQ*) reveals the indebtedness of Tuvill's essays to Bacon. In "Winstanley's *Lives:* An Appraisal" (*MLQ*) William R. Parker shows that, although Winstanley made free use of Phillips's *Theatrum Poetarum,* his own contributions were by no means negligible.

In a critical essay entitled "Restoration Comedy (Reconsiderations II)" (*KR*) Julian Symons advanced opinions that Eric R. Bentley felt obliged to protest in "The Views of Mr. Symons" (*KR*), printed in the columns of the same journal. Lucyle Hook, in "James Bridges Drops in at the Theatre" (*HLQ*), probes the diary of the future Duke of Chandos for information, particularly concerning the Betterton Group's playhouse in Lincoln's Inn Fields for the years 1697-1701.

MILTON

Miltonic research produced several articles and two books, Douglas Rush's *Paradise Lost in Our Time* (Cornell) and Sr. M. Irma Corcoran's *Milton's Paradise with Reference to the Hexameral Background* (Catholic U.). Among the articles were "*Skriften om Paradis* and Milton" (*JEGP*) by W. G. Johnson, on Spegel's Swedish version of *Paradise Lost,* and Roland M. Smith's "Spenser and Milton: An Early Analogue" (*MLN*), which calls attention to parallels between the verse-letter from Spenser to Gabriel Harvey, published in 1580, and Milton's famous sonnet: "How soon hath time the subtle thief of Youth." John E. Hardy's "Reconsiderations: I—*Lycidas*" (*KR*) is a critical essay on the poem, and William Haller's "'For the Liberty of Unlicenc'd Printing'" (*ASch*) discusses the *Areopagitica.* John S. Diekhoff argues in "Eve, the Devil, and *Areopagitica*" (*MLQ*) that there is no inconsistency in Milton's thought in *Paradise Lost* (IX, 322-41) in which Eve paraphrases a passage from *Areopagitica.* Joshua H. Neumann's "Milton's Prose Vocabulary" (*PMLA*) reveals, in the matter of prose vocabulary, the number and variety of Milton's permanent contributions to the English language.

EIGHTEENTH CENTURY POETS AND DRAMATISTS

"Arabesque in Verse (Reconsiderations III)" (*KR*) by Wylie Sypher is a critical estimate of Alexander Pope. H. W. Starr considers "Gray's Revisions of his Friends' Poetry" (*JEGP*), and Wallace C. Brown in "Churchill's Mastery of the Heroic Couplet" (*JEGP*) contends that "at his best . . . Churchill is one of the masters of the heroic couplet and the last great neo-classic satirist." Roy H. Pearce's "The Eighteenth-Century Scottish Primitivists: Some Reconsiderations" (*ELH*) treats of the discussions of original genius, the noble savage, etc., and Robert A. Aubin's "John Auther, Philomusus" in the *Journal of the Rutgers University Library* renders a brief account of Auther's *Poems on Various Occasions* (1777).

Lawrence M. Price gives an account of "The Works of Oliver Goldsmith on the German Stage, 1776-1795" (*MLQ*), while Edward H. Weatherly in "Foote's Revenge on Churchill and Lloyd" (*HLQ*) interprets the revised version of Foote's play *Taste* (1761) as satire on Churchill and Lloyd in reply to their attacks on Foote in *The Rosciad* and *The Actor*. The argument that the concept of "sentimentalism" as defined by Bernbaum and other scholars is not applicable to Lillo's *The London Merchant* is proposed by George B. Rodman in "Sentimentalism in Lillo's *The London Merchant*" (*ELH*). Raymond D. Havens takes issue with Rodman in "The Sentimentalism of *The London Merchant*" (*ELH*).

EIGHTEENTH CENTURY PROSE WRITERS

Swift.—The year was productive of several noteworthy items concerning Jonathan Swift, the most ambitious being Arthur E. Case's *Four Essays on "Gulliver's Travels"* (Princeton). Articles dealing with Gulliver were "Lilliput and Leprecan: Gulliver and the Irish Tradition" (*ELH*) by Margaret R. Grennan, which suggests that the Irish imagination influenced Swift more strongly than has been thought, and "Gulliver and the Moons of Mars" (*JHI*) by J. H. Gould, which contends that Swift's account of the moons of Mars was neither "inspiration nor a happy guess, but rather it was his failure to comprehend certain implications in Newton's *Principia* that led him into unintentional absurdity." Godfrey Davies' "A New Edition of Swift's *The Story of the Injured Lady*" (*HLQ*) attributes to Charles Lucas the "Preface, by A. Freeman," added to a newly discovered edition of 1749. Arthur E. Case in "Swift and Sir William Temple—A Conjecture" (*MLN*) suggests 1687 as the year in which Swift consumed the "surfeit of fruit" which induced his life-long tendency to giddiness. A detailed study of Swift's attitudes toward the relief of the underprivileged may be found in "Jonathan Swift and Charity" (*JEGP*) by Louis A. Landa.

Defoe, Sterne, Smollett.—"Defoe and *Robert Drury's Journal*" (*JEGP*) by Arthur W. Secord finds evidence that the imaginary elements in the *Journal* are bound in a more substantial framework of fact than has formerly been supposed. A second Defoe item, "Defoe and His Northern Printers" (*PMLA*), by Charles Eaton Burch, shows that Defoe, to extend his journalistic activities in Scotland and northern England, found it expedient to work in close collaboration with his Northern printers. *A Fellow of Infinite Jest* (Prentice-Hall) by Thomas Yoseloff is a biography of Lawrence Sterne with an examination of his writings, and *The Profane Virtues* (Viking) by Peter Quennell contains an ably drawn portrait of Sterne as well as studies of Boswell, Gibbon, and John Wilkes. A real contribution to an understanding of Smollett's sources is George M. Kahrl's *Tobias Smollett, Traveler-Novelist* (Chicago), a book which shows the influence of Smollett's travels and his reading of travel literature upon his prose fiction.

Johnson, the Lambs, and Others.—"Dr. Johnson and War" (*ELH*) by H. R. Kilbourne deals with Johnson's interest in military and naval matters. Katherine Anthony's *The Lambs* (Knopf) is a biographical study of Charles and Mary Lamb, indeed, a portrait of their entire circle. Mary is stressed in this account, and the author analyzes the tragedy of Mary's insanity, which led to the killing of her mother and the subsequent close connection of brother and sister. "Horace Walpole Reread" is an evaluation of Walpole in the *Atlantic Monthly* by Wilmarth S. Lewis, foremost American collector of Walpole data. Alfred Owen Aldridge's "Shaftesbury and the Test of Truth" (*PMLA*) attests that Shaftesbury did not, in his *Characteristics,* represent ridicule as a means of discovering new truth. In "Mr. and Mrs. Garrick: Some Unpublished Correspondence" (*PMLA*), Harry W. Pedicord reveals the existence of six hitherto unpublished letters to or by the Garricks.

THE ROMANTIC POETS

General Works.—Before consideration of the individual poets is undertaken, two general works of significance should be mentioned: Charles F. Harrold's "The Romantic Movement: A Selective and Critical Bibliography for the Year 1944" (*ELH*) and William S. Ward's "Some Aspects of the Conservative Attitude Toward Poetry in English Criticism, 1798-1820" (*PMLA*), which analyzes the forces of reaction that the Romantic Poets had to cope with.

Wordsworth.—In *Strange Seas of Thought* (Duke), Newton P. Stallknecht endeavors to show that Wordsworth's "pantheistic theory of imagination" came from the seventeenth-century German mystic, Jakob Behmen (or Boehme). The *Letters of Dora Wordsworth* (Packard), edited by Howard P. Vincent, cast interesting sidelights on Wordsworth as seen through his daughter's eyes and revealed in her letters to Maria Jane Jewsbury. "Wordsworth and Railways in 1844-1845" (*MLQ*), by John E. Wells, deals with the letters and pamphlets written by the poet in opposition to the proposed railway along Lake Windermere.

Coleridge.—Considerable Coleridge scholarship found expression in 1945. Elizabeth Schneider's "The 'Dream' of *Kubla Khan*" (*PMLA*) dissented from any belief in the dream-composition "or any other extremely remarkable form of automatic composition of *Kubla Khan,*" and Charles S. Bouslog's "The Symbol of the Sod-Seat in Coleridge" (*PMLA*) endeavored to establish the fact that the poet used well defined personal symbolism. R. Florence Brinkley contributed some notes concerning Coleridge material at the Huntington Library in "Some Unpublished Coleridge Marginalia: Richter and Reimarus" (*JEGP*) and in "Coleridge on John Petoin and John Locke" (*HLQ*) printed Coleridge marginalia from a copy of Petoin's *Letters Concerning Mind.* In "The Gloss to *The Rime of the Ancient Mariner*" (*MLQ*), Huntington Brown expressed his belief that the gloss "serves to emphasize the remoteness of the story and its teller" and is in effect choric in its function. Earl L. Griggs in "Robert Southey's Estimate of Samuel Taylor Coleridge: A Study in Human Relations" (*HLQ*) contended that a study of Southey's letters reflects his changing attitudes toward Coleridge.

Byron.—Two books which afford studies in Byron's *Don Juan* are Paul Graham Trueblood's *The Flowering of Byron's Genius* (Stanford) and Elizabeth French Boyd's *Byron's "Don Juan"* (Rutgers).

Keats.—Stephen de Ullmann's "Romanticism and Synaesthesia" (*PMLA*) was a comparative study of sense transfer in Keats and Byron. Harold E. Briggs analyzed "Keats's Conscious and Unconscious Reactions to Criticism of *Endymion*" (*PMLA*) and concluded that Keats was greatly and adversely affected by the contemptuous reviews. In "Keats and Chaucer" (*MLQ*), F. E. L. Priestly revealed that Keats in 1818-19 was brought from a sentimental interest in Chaucer to a careful study of Chaucer's narrative by the demands of his own art and by the suggestions in Hazlitt's lectures. Allen Tate offered the first part of a critical evaluation of Keat's poetry in his "A Reading of Keats" (*ASch*).

Shelley.—Shelley was the most written about of the romantic poets in 1945. Newman Ivey White's *Portrait of Shelley* (Knopf) heads the list. The book is a shortened edition of Dr. White's two-volume *Shelley* published in 1940 but is by no means a mere condensation of the original study. The appendices and footnotes of the original have been omitted, and the result is an eminently readable volume. *The Letters of Mary W. Shelley* (Oklahoma), edited by Frederick L. Jones, contains in its two volumes almost 700 letters assembled from widely scattered sources. About half are printed for the first time, and the bulk of them are to Claire Clairmont, J. H. Payne, Sir Timothy Shelley's lawyers, and various publishers. In *A Stage Version of Shelley's "Cenci"* (Caxton Printers), Arthur C. Hicks and R. Milton Clarke provide an introductory essay and an acting version of the poet's blank-verse drama. "The Stage History of Shelley's *The Cenci*" (*PMLA*), by Kenneth N. Cameron and Horst Frenz, provides further evidence that the play is not closet drama but a great acting play. Two other articles by Cameron are "Shelley's Use of Source Material in *Charles I*" (*MLQ*), revealing that Shelley took materials from the histories by Clarendon, Bulstrode, Whitelocke, Hume, and Mrs. Catherine Macaulay, and "Shelley and the Reformers" (*ELH*), dealing with the extent and significance of Shelley's interest in the movement for Parliamentary reform. Richard H. Fogle's "Romantic Bards and Metaphysical Reviewers" (*ELH*) is a reply to the "new" critics—T. S. Eliot, John Crowe Ransom *et al.*—who have deprecated Shelley.

NINETEENTH CENTURY ESSAYISTS

"Thomas De Quincey, Symptomatologist" (*PMLA*), by Cecilia Hennel Hendricks, establishes De Quincey's ability as a clinical reporter of facts. R. H. Super discusses the date of Walter Savage Landor's separation from his wife in "When Landor Left Home" (*MLQ*). "Hazlitt and Malthus" (*MLN*), by William P. Albrecht, is on the *Reply to the Essay on Population.* There are two Carlyle items: "The Premature Death of Thomas Carlyle (1795-1945). An Obituary and a Footnote" (*ASch*) by Eric R. Bentley, an analysis of Carlyle's reputation today, and "Thomas Carlyle, Prophet of Fascism" by J. Selwyn Schapiro in the *Journal of Modern History,* in which the author claims that Carlyle's views "are revealed to be those of a fascist in their essential implications."

Hill Shine and Charles E. Whitmore write on John Stuart Mill, the former doing "J. S. Mill and an Open Letter on the Saint-Simonian Society in 1832" (*JHI*) and the latter "Mill and Mathematics: An Historical Note" (*JHI*). In "Borrow's Translation of the *Walpurgisnacht*" (*JEGP*), Lillian E. Reed prints the text from a manuscript now in the library of Yale University, and J. D. Kern, E. Schneider, and I. Griggs provide in "Lockhart to Croker on the *Quarterly*" (*PMLA*) a list of titles and authors of articles in the *Quarterly.*

NINETEENTH CENTURY FICTION AND POETRY

One of the year's most important books was *The Letters and Private Papers of William Makepeace Thackeray* (Harvard), edited by Gordon N. Ray. Although it has been 83 years since the death of the great novelist, this is the first comprehensive collection of his letters. Lucy Poate Stebbins and Richard Poate Stebbins wrote *The Trollopes* (Columbia), the story of the four principal members of the family: Frances and Thomas Anthony, the parents; Thomas Adolphus, the eldest son, and Anthony, the novelist, upon whom the book eventually centers.

Dickens items included "Dickens' *Christmas Carol* after a Hundred Years: A Study in Bibliographical Evidence" by Philo Calhoun and Howell J. Heaney in the *Papers of the Bibliographical Society of America,* a bibliographical study of the first edition, and "Contributions of Early American Journals to the Study of Charles Dickens" (*MLQ*) by Carolyn W. and Laurence H. Houtchens, in which new facts are gleaned from the New York *Mirror,* the *Knickerbocker,* the Bunker-Hill *Aurora,* and the *New World.*

Emerson Grant Sutcliffe's "Unique and Repeated Situations and Themes in Reade's Fiction" (*PMLA*) showed that Reade too often sought fame as a novelist through the multiplication of startling incidents, while Wayne Burns' "Pre-Raphaelitism in Charles Reade's Early Fiction" (*PMLA*) was an examination of what Reade had to say about art and artists in his novel *Christie Johnstone.*

In "The Note-Books of Samuel Butler" (*PMLA*), Lee Elbert Holt attempted to present a picture of the original note-books as they were before Henry Festing Jones edited them. *Victoria Through the Looking Glass* (Simon and Schuster), by Florence Becker Lennon, is a biography of Charles Dodgson (Lewis Carroll) in which the creator of Alice was interpreted in somewhat Freudian terms. Edgar W. Smith in *Baker Street Inventory* (The Pamphlet House) did a bibliography of Sherlock Holmes materials.

Three Browning items are worthy of mention. James A. McPeek's "The Shaping of *Saul*" (*JEGP*) was on Browning's indebtedness to Sir Thomas Wyatt's *Seven Penitential Psalms,* and Stewart W. Holmes's "Browning: Semantic Stutterer" (*PMLA*) contended that when the poet wrote as a prophet or metaphysician, he lost his ability to write meaningfully. C. N. Wenger, in "Clio's Rights in Poetry: Browning's *Cristina and Monaldeschi*" (*PMLA*), re-examined Browning's poem and raised several questions about it.

In *Francis Thompson: In His Paths* (Bruce), Terence L. Connolly, America's foremost authority on Thompson, wrote a combined travelogue, biography, and literary appreciation of the poet. Jerome H. Buckley's *William Ernest Henley: A Study in the "Counter-Decadence" of the 'Nineties* (Princeton) is a biography which made Henley out to be a rectifier of the decadent tendencies of his era—a balance against such as Oscar Wilde.

CONTEMPORARY LITERATURE

H. T. Webster, in "Joseph Conrad: A Reinterpretation of Five Novels" (*CE*), states that, judged on the basis of his best work, Conrad "has every claim to belong in the small company of really great writers of prose fiction." James T. Farrell contributed two articles on James Joyce to the *New York Times Book Review.* In the first, "Joyce and His First Self-Portrait," he discusses Joyce and *The Portrait of the Artist as a Young Man* in relation to its Irish setting and historical background. The second, "Joyce and the Tradition of the European Novel," is an examination of the relation of *The Portrait* to the tradition of the European novel. Vivienne Koch Macleod, in "The Influence of Ibsen on Joyce" (*PMLA*), discusses the considerable effect of the Norwegian dramatist on the Irish novelist, and Ernest Bernbaum in "The Crucial Question Regarding *"Finnegan's Wake"* (*CE*) answers negatively the question whether or not Joyce's vision of life is true and important.

Joan Bennett's *Virginia Woolf: Her Art as a Novelist* (Harcourt, Brace) is an analysis of Mrs. Woolf's novels, with much reference to the text of the books. Harry Slochower's *No Voice Is Wholly Lost* (Creative Age) offers interpretations of the thought of a host of writers, including D. H. Lawrence. James E. Tobin wrote "On Laughing in Graveyards: The Essays of D. B. Wyndham Lewis" (*CW*), and Eric R. Bentley did an analysis of "The Theory and Practice of Shavian Drama" for *Accent.*

John V. Kelleher examined "Irish Literature Today" in the columns of the *Atlantic Monthly,* and A. J. Reilly wrote on "The Religious Verse of Joseph Campbell" (*CW*). Robert Horan was the author of "In Defense of Dylan Thomas" (*KR*), and there were two Yeats items: W. Y. Tindall's "The Symbolism of W. B. Yeats" in *Accent* and James A. Notopoulos's *"Sailing to Byzantium"* in the *Classical Journal.* Robert W. Stallman's "Annotated Bibliography of A. E. Housman: A Critical Study" (*PMLA*) brought together for the first time all evaluations of Housman's poetry and poetic theory done between 1920 and 1945. Genevieve W. Foster studied "The Archetypal Imagery of T. S. Eliot" (*PMLA*), and Richard Chase, in "The Sense of the Present" (*KR*), wrote a critical essay largely on Eliot. "Obscurity in Modern Literature" (*ASch*) was a symposium contributed to by Marc Friedlander, William V. O'Connor, F. W. Dupee, and W. Y. Tindall, dealing with such figures as Gerald Manly Hopkins, James Joyce, T. S. Eliot, and others.

MISCELLANEOUS

Books and articles impossible to classify according to period include several important works. Charles Morgan's *Reflections in a Mirror* (Macmillan) is a book of mature critical essays, among which are excellent evaluations of Thomas Hardy and Emily Brontë. Sir Arthur Quiller-Couch's *Memories and Opinions by Q* (Macmillan) contains the early chapters of the autobiography the auther was writing when death intervened. It is a most attractive little volume, in which Q's opinions on books and authors are of interest. *A Foreword to Literature* (Appleton Century) by Ernest Earnest is an attempt to explain some of the fundamentals of literary criticism. A. L. Rowse's *The English Spirit* (Macmillan) contains essays on Thomas More, John Pym, Horace Walpole, Sir Walter Raleigh, George Herbert, Winston Churchill, and others whom Rowse feels reflect the spirit of England, at the core of which is "happiness." *The Dynamics of Literature* (Columbia) is by Nathan C. Starr and *The Basis of Criticism in the Arts* (Harvard) by Stephen C. Pepper. Marjorie Farber treats "Subjectivity in Modern Fiction" (*KR*), and Eric R. Bentley comments on "The Drama at Ebb" (*KR*). Thomas H. Uzzell's "Modern Innovations" (*CE*) deals with the technique of the novel.

GERMANIC LANGUAGES AND LITERATURES

By RICHARD JENTE
HEAD OF DEPARTMENT OF GERMANIC LANGUAGES AND LITERATURES,
UNIVERSITY OF NORTH CAROLINA

BIBLIOGRAPHY

The most comprehensive and reliable bibliography for the Germanic languages and literatures is that compiled annually by Henry W. Nordmeyer for the *PMLA*[*] Supplement. While this includes only writings of Americans, that by J. G. Kunstmann, "Recent Literature of the Renaissance: D. Germanic Languages," *SP*, records the productions of foreign scholars as well. The *GR* lists books received, while the *MfdU* annually lists alphabetically the members of the departments of German at our colleges and universities and their publications. The *AGR* contains interesting and illuminating travel diaries of early German settlers in America and also biographies of prominent Americans of German origin who have contributed abundantly to our American civilization. It also occasionally brings a bibliography of German-Americana. The *ASR* covers similar achievements of Americans of Scandinavian origin, with emphasis on Scandinavian-Americana.

ANNIVERSARY PUBLICATIONS

While 1945 does not stand out as an anniversary year in German literature, 1944 does and thus marks a revival of interest in several authors. The outstanding work here is E. H. Zeydel's excellent reproduction into English verse of *The Ship of Fools by Sebastian Brant*, thus marking the 450th year of its first appearance. Rev. Francis Roth has remembered the picturesque Augustinian preacher and writer "Pater Abraham a Sancta Clara 1644-1709" (*MfdU*, 36, 288-303). Highly to be commended is the summary by Martin Schütze of "Johann Gottfried Herder, August 25, 1744-

---

[*] Abbreviations: *AGR — American-German Review, ASR—American Scandinavian Review, GQ—German Quarterly, GR—Germanic Review, JEGP—Journal of English and Germanic Philology, MfdU—Monatshefte für deutschen Unterricht, MLN—Modern Language Notes, MLQ—Modern Language Quarterly, PMLA—Publications of the Modern Language Association, SP—Studies in Philology.*

December 18, 1803: His Significance in the History of Thought" (*MfdU,* 36, 425-445). D. W. Schumann has supplied a good interpretation and evaluation of "Detlev von Liliencron, 1844-1909" (*MfdU,* 36, 385-408 and 37, 65-87). A sort of anniversary publication is that of W. A. Reichart, "Fifty Years of Hauptmann Study in America" (*MfdU,* 37, 1-31).

LITERARY CRITICISM

The most important articles in this field to be noted are the following: Karl Viëtor, "Deutsche Literatur als Geistesgeschichte, ein Rückblick" (*PMLA,* 60, 899-916); A. C. Gorr, "Theories of Some German Neoclassicists" (*GR,* 20, 138-146); H. Henel, "Friedrich Schlegel und die Grundlagen der modernen literarischen Kritik" (*GR,* 20, 81-93); Leo Spitzer, "Deutsche Literaturforschung in Amerika" (*MfdU,* 37, 475-480). D. W. Schumann has contributed two extensive and stimulating articles: "Observations on Enumerative Style in Modern German Poetry" (*PMLA,* 59, 1111-1155), and "Conjunctive and Disjunctive Enumeration in Recent German Poetry" (*PMLA,* 60, 517-566).

EARLY LITERATURE AND LANGUAGE

Under this category is found a wide range of articles from the earliest Old High German period to the beginnings of the seventeenth century: D. A. McKenzie, "Otfridiana" (*MLQ,* 6, 345-348); W. G. Moulton, "Scribe g of the Old High German Tatian Translation" (*PMLA,* 59, 307-334). Two scholars are interested in Hrotsvitha, the literary nun of Gandersheim: Z. Haraszti, *The Works of Hroswitha,* in *More Books,* and E. H. Zeydel who has published several articles which open up entirely new vistas: "Ekkehard's Influence upon Hrotsvitha, a Study in Literary Integrity" (*MLQ,* 6, 333-339); "Knowledge of Hrotsvitha's Works Prior to 1500" (*MLN,* 59, 382-385); "On the Two Minor Poems in the Hrotsvitha Codex" (*MLN,* 60, 373-376). Several articles deal with the language and literature of the fifteenth century: C. F. Bühler and Carl Selmer, "An Unpublished Middle High German *Banntaiding*" (*PMLA,* 60, 325-339); C. F. Bayerschmidt, "Johannes Veghe, a Low German Preacher of the Fifteenth Century" (*GR,* 20, 3-20); C. H. Bell and E. G. Gudde, *The Poems of Lupold Hornburg* (Univ. of Cal. Publ. in Modern Philology); W. I. Schreiber, "The *Depositio Cornuti* at Wittenberg University" (*GR,* 20, 21-32), an interesting and hitherto unmentioned description of student life and initiation at the beginning of the fifteenth century; Sister M. Alvarita Rajewski, *Sebastian Brant: Studies in Religious Aspects in His Life and Work with Special Reference to the "Varia Carmina"* (The Catholic Univ. of America Studies in German). Two noteworthy seventeenth century articles are: C. G. Loomis, "Martin Opitz in Seventeenth Century England" (*MLQ,* 6, 341-344); C. F. Melz, *An Evaluation of the Earliest Translation of "Don Quixote" "Juncker Harnisch aus Fleckenland"* (Univ. of Cal. Publ. in Modern Philology).

EIGHTEENTH CENTURY

The number of publications here is not numerous, but the few here noted are of high quality and are real contributions to our knowledge of the period: Henry C. Hatfield, *Winckelmann and His German Critics, 1755-1781: A Prelude to the Classical Age* (Columbia Univ. Germanic Studies); F. J. Schmitz, *The Problem of Individualism and the Crises in the Lives of Lessing and Hamann* (Univ. of Cal. Publ. in Modern Philology); C. C. D. Vail, "Pastor Lessing's Knowledge of English" (*GR,* 20, 33-46).

GOETHE AND SCHILLER

Karl Viëtor, in an article "Goethes Gedicht auf Schillers Schädel" (*PMLA,* 59, 142-183) started a controversy as to the application of the words: "Ist fortzusetzen," which are obviously misplaced in the last edition that Goethe saw through the press. Discussion and replies by F. H. Mautner, E. Feise, and Karl Viëtor are found in *PMLA,* 59, 1156-1172. A. R. Hohlfeld continues with a different interpretation: "Zur Frage einer Fortsetzung von Goethes *Wilhelm Meisters Wanderjahre*" (*PMLA,* 60, 399-420). Cf. Viëtor's reply, *Ibid.* 421-426. Other outstanding articles and monographs on Goethe are: A. R. Hohlfeld, "Reue in Goethes *Faust*" (*MfdU,* 37, 72-80); W. J. Mulloy, *The German Catholic Estimate of Goethe (1790-1939), a Contribution to the Study of the Relation of German Catholicism to Secular Culture* (Univ. of Cal. Publ. in Modern Philology); Carl Hammer, *Goethes Dichtung und Wahrheit; 7. Buch, Literaturgeschichte oder Bildungserlebnis? Versuch einer kritischen Wertung* (Univ. of Ill. Press); G. Ehrlich, "Goethe, Freiheit und Sturm und Drang," (*PMLA,* 59, 792-812); A. Scholz, "Ueber Goethes Gestalten" (*GQ,* 18, 76-85); W. A. Nitze, "Goethe and Ronsard" (*PMLA,* 59, 486-490); P. Matenko, "The Goethe, Schiller, and Byron Translations of the Saaling Album" (*MLQ,* 6, 53-69); Leo Spitzer, "Nochmals: zur Interpretation von *Wanderers Sturmlied*" (*GR,* 20, 161-165).

NINETEENTH CENTURY

Several noteworthy monographs and articles on authors of this period are: L. M. Price, *The Vogue of Marmontel on the German Stage* (Univ. of Cal. Publ. in Modern Philology); E. Brewer, *The New England Interest in Jean Paul Friedrich Richter* (*Ibid.*); Heinrich Heine, *Germany, A Winter's Tale,* English Version by Herman Salinger, Introduction by Herman Kesten (N. Y. 1944). New light on the Heine-Menzel feud is given by C. Colditz, "Ueber den Denunzianten" (*MLQ,* 6, 131-147). Mörike as a supreme artist is shown by F. H. Mautner, "Morikes *Mozart auf der Reise nach Prag*" (*PMLA,* 60, 199-220). A fine article in contrast is that by Ada M. Klett, "Doom and Fortitude—a Study of Poetic Metaphor in Annette von Droste-Hülshoff (1797-1848) and Emily Dickinson (1830-1886)" (*MfdU,* 37, 37-54). Introspective processes are investigated in the following: Walter Silz, "Otto Ludwig and the Process of Poetic Creation" (*PMLA,* 60, 860-878), and F. E. Coenen, "Theodor Storm's Personifications" (*SP,* 42, 654-662).

CONTEMPORARY LITERATURE

An excellent survey of the various currents of German literature through the past seven decades that will appeal to the average reader as well as the student of German literature is Victor Lange, *Modern German Literature, 1870-1940* (Cornell Univ. Press, Ithaca, 1945).

Of the contemporary writers, Thomas Mann has received the most attention. A recent bibliography of articles, translations, and essays by Americans or German emigrés living in America, as well as the writings and speeches of Thomas Mann published since his arrival in the United States, to the number of 473 items, has been accumulated by Walter A. Reichart (*MfdU,* 37, 389-408). The most comprehensive article is that of Bernhard Blume, "Thomas Manns Goethebild" (*PMLA,* 59, 261-290; 556-584; 851-868). The same subject is treated by Ernst Cassirer, the German philosopher who recently died in this country (*GR,* 20, 166-194). Some further essays are: G. Loose, *Thomas Mann and the Problem of Decadence* (Univ. of Col. Studies); A. von Gronicka, "Thomas Mann and Russia" (*GR,* 20, 105-137); W. F. Michael, "Thomas Mann's *Joseph der Ernährer*" (*MfdU,* 37, 32-36); Elizabeth E. Bohning, "The 'Hintergrundsgestalten' in *The Magic Mountain*" (*GQ,* 18, 189-202).

Rainer Maria Rilke is also a favorite theme for American scholars and translators. Two volumes of his poems in translation are those of Carl Niemeyer and Jessie Lemont, respectively. His letters have been translated by Jane B. Greene and M. D. Herter Norton (N. Y., 1945). Two illuminating articles are: H. W. Hewett-Thayer, "Rilke and the Boscoreale Frescoes" (*GR,* 20, 47-53); O. S. Fleissner, "Rilke and van Gogh" (*GR,* 20, 94-104).

Franz Werfel also occupies the center of interest. Here only a few articles can be mentioned: A. D. Klarmann, "Allegory in Werfel's *Das Opfer* and *Jakobowsky and the Colonel*" (*GR,* 20, 195-217); W. A. Willebrand, "Franz Werfel's *In einer Nacht, Eine blassblaue Frauenschrift* and *Jakobowsky*" (*MfdU,* 37, 146-158); Wilma Brun, *Franz Werfel* (Univ. of Col. Studies).

Numerous articles have appeared on Hugo von Hofmannsthal: W. Naumann, "Das Visuelle und das Plastische bei Hofmannsthal" (*MfdU,* 37, 159-169); Herbert Steiner, "Hugo von Hofmannsthals 'Notizen zu einem Grillparzervortrag'" (*MfdU,* 37, 170-175); E. Feise, "Philosophische Motive im Werk des jungen Hofmannsthal" (*MfdU,* 37, 31-39). Other contemporaries have been treated in the following essays: A. von Gronicka, *Henry von Heiseler, a Russo-German Writer* (Columbia Univ. Germanic Studies); K. S. Weimar, *The Concept of Love in the Works of Hermann Stehr* (Univ. of Penn. Diss. Philadelphia, 1945); F. W. J. Heuser, "Gerhart Hauptmann and Frank Wedekind" (*GR,* 20, 54-68); Erich Hofacker, "Zu Kolbenheyers *Paracelsus*" (*MfdU,* 37, 129-145).

GERMANS IN AMERICA

As noted above under "Bibliography" the *AGR* is particularly dedicated to this field. Outstanding articles appearing elsewhere are here listed: A. H. Moehlenbrock, "The German Drama on the New Orleans Stage" (*Louisiana Historical Quarterly* 26, 361-627); A. E. Zucker, "The History of the German Theater in Baltimore" (*GR,* 18, 123-135); H. W. Pfund, *A History of the German Society of Pennsylvania, Founded 1764* (Philadelphia, 1944); A. E. Zucker, "A Monument to Robert Reitzel" (*GR,* 20, 147-152); A. J. Prahl, "Bayard Taylor in Germany" (*GQ,* 18, 16-25); Carl Wittke, "Karl Heinzens Literary Ambitions" (*MfdU,* 37, 88-98); Dieter Cunz, "Carl Heinrich Schnauffers literarische Versuche" (*PMLA,* 59, 524-539). The twenty-sixth report of the Society for the History of the Germans in Maryland (Baltimore, 1945) contains a number of articles preliminary to the ambition of the Society to publish a definitive *History of the Germans in Maryland.*

SCANDINAVIAN LANGUAGES AND LITERATURES

The American-Scandinavian Foundation (New York) has sponsored several recent publications: *Icelandic Poems and Stories,* edited by Richard Bek; *Scandinavian Plays of the 20th Century,* First Series: *Swedish Plays,* Second Series: *Norwegian and Danish Plays,* edited by Alrik Gustavson and others; *The Vatndaler's Saga,* translated by Gwyn Jones; *The Skalds, a Selection of Their Poems,* by Lee M. Hollander; *Twelve Stories by Steen Steenson Blicher,* translated from the Danish by Hanna Astrup Larsen, with an introduction by Sigrid Undset. Halldór Hermannsson has edited *The Vinland Saga* and *The Saga of Thorgils and Haflid* (*Islandica* 30 and 31), as well as a *Second Supplement to the Catalogue of the Islandic Collection Bequeathed by Willard Fiske,* all three of these works from the Cornell University Press.

ROMANCE LANGUAGES AND LITERATURES

By Madaline Wallis Nichols
Assistant Professor, Duke University

GENERAL

In 1944 the main interest in the Romance language field was in the teaching of the spoken language for practical use in the war emergency. In 1945 that interest in the spoken language was still reflected in the professional periodicals, possibly owing in part to a publication lag, in part to a sober professional evaluation of the claims made for the Army Specialized Training Program, with consideration of the extent to which its best features might be incorporated in the rigidity of academic schedules. Changes already effected in modern language teaching as a result of the war experience were noted in the *Croft's Modern Language News* (December): an increased emphasis on the oral approach; a frequent increase in the number of class hours in the elementary courses to allow for increased oral work; a widespread use of extra class periods for laboratory work; and an increased use of the phonograph. Twenty-nine regional conferences were sponsored by the National Education Association to ascertain the place of languages in American education and to consider the need for improved instruction and materials.

New general trends of interest, however, were more noteworthy than any preoccupation with pedagogical techniques. It was obvious that the war's end loosed a flood of information about modern French literature—the publication of the war years of literary isolation. Incidentally, this increased emphasis on modern French seems to have been extended during the war to include the literature of French Canada. At the year's end Spanish appeared to be the literature most affected by a continuing isolation.

Again, as the war swirled away from Latin America, literary attention also seemed to turn aside. Quite possibly this will mean a higher caliber of scholarship found in articles that are no longer written by the "new Christians" of the war years. Certainly, if the 1945 section of articles on the Latin American theater furnishes any standard for judgment, the new articles may prove to be better, in general, than those of recent years.

The literature of Brazil—even more, that of Portugal—continued to be neglected in the scholarly research of the United States, despite all the emphasis of recent years on the value of Portuguese study in this country. Possibly it is as yet too early for the elementary work, now increasingly offered in our colleges and universities, to find its reflection in creative scholarship. Again, the general lack of such scholarship may be a sad commentary on the inadequacy of present university programs of Portuguese instruction. Such study of Portuguese as there was during the year turned almost exclusively to Brazil.

Among the year's many considerations of a necessary improvement in inter-American relationships, cultural and otherwise, are J. C. Patterson's "Inter American Cultural Relations and Language Teaching" (*Hisp.*,[1] 27-32), with its emphasis upon the value of language in any intelligent contact with foreign lands, and the general survey of "Cultural Relations," published by M. W. Nichols in the annual volume on *Inter-American Affairs*, edited by A. Whitaker (Columbia). H. G. Doyle's "A Realistic Approach to Practical Inter-Americanism" (*Hisp*, 208-209) was one of the best articles printed on this topic to date.

BIBLIOGRAPHIES

General.—The standard bibliographical work in the field is the "American Bibliography for 1944" appearing in the annual Supplement of the *PMLA*, with sections on French by H. C. Lancaster, and on Italian, Spanish, and Portuguese by E. B. Williams. General bibliographical studies which contained sections on the work in the Romance field were: "Recent Literature of the Renaissance" (*SP*, 271-377), in which S. F. Will covered French literature, J. G. Fucilla, the Italian, and L. L. Barrett and S. E. Leavitt, the sections on Spanish and Portuguese; J. J. Parry's "A Bibliography of Critical Arthurian Literature for the Year 1944" (*MLQ*, 219-223); and "English Literature, 1660-

---

[1] Abbreviations used for periodicals are: *BA*, *Books Abroad; FR*, *French Review; Hisp*, *Hispania; HR*, *Hispanic Review; Ital*, *Italica; L*, *Language; MLJ*, *Modern Language Journal; MLN*, *Modern Language Notes; MLQ*, *Modern Language Quarterly*, *MP*, *Modern Philology; PMLA*, *Publications of the Modern Language Association; PQ*, *Philological Quarterly; RFH*, *Revista de Filología Hispánica; RHM*, *Revista Hispánica Moderna; RI*, *Revista iberoamericana; RR*, *Romanic Review; S*, *Speculum; SP*, *Studies in Philology*. University presses are indicated by the name of the institution alone.

1800: A Current Bibliography" by A. Friedman and L. A. Landa (*PQ,* 123-168), with a section on "Continental Background." W. Rice published an "Annotated Bibliography of Modern Language Methodology: July 1943-December 1944" (*MLJ,* 431-458).

French.—A bibliography of note in the field of comparative literature was "Anglo-French and Franco-American Studies: A Current Bibliography" by D. F. Bond and J. M. Carrière (*RR,* 161-190), with an annotated survey of 1944 materials covering "culture and literary history from the sixteenth century to the present day." R. P. Rosenberg, *et al.,* published a similar bibliography of "Franco-German Studies" (*RR,* 191-199).

Bibliographies of new French literature were: H. Bokanowsky's "French Literature in Algiers" (*BA,* 125-130), with a note on books and reviews published since 1939; L. and A. Gaudin's "Aspects. 1944" (*FR,* 249-265), listing the principal works on France and the war; an interesting bibliographical article by P. Rhodes on "How the French Writers Kept Going" (*Va. Quarterly Rev.,* 535-552); and the timely and useful "Post-liberation Publishing in France" by H. C. Rice (*FR,* 327-333).

The French Book Review Committee, under D. M. Dougherty, printed a "French book list" of "titles published for the most part in New York and Montreal" (*MLJ,* 524-528), while G. and H. Kurz printed a useful "Bibliography of French Textbooks Published in the United States from 1940-1945" (*FR,* 368-389). A more specialized bibliographical study of the Utopias of the late seventeenth and early eighteenth centuries was M. E. Storer's "Bibliographical Observations on Foigny, Lahontan and Tyssot de Patot" (*MLN,* 143-156).

Italian.—The excellent annotated "Bibliography of Italian Studies in America" by C. S. Singleton and V. Luciani appeared in the numbers of *Italia.* A. Borselli described a collection of materials in the University of Illinois in "I manoscritti della Collezione Cavagna relativi alla famiglia Lampugnani di Parma" (*Ital,* 109-117), while in "Italian Culture in Eighteenth-century American Magazines" (*Ital,* 21-31), H. R. Marraro surveyed some 90 American papers and reviews to determine to what extent Italian culture was known in America.

Latin American.—Regular annual bibliographical studies of Latin American language and literatures appear in the *RHM,* with parallel sections on Spain and Portugal in the *RFH.* The 1945 *Handbook of Latin American Studies* (Harvard) contained excellent bibliographies of the literary work of 1942 by S. E. Leavitt, I. A. Leonard, F. Aguilera, and S. Putnam. Extensive bibliographies also appeared in the *Handbook on the Teaching of Spanish and Portuguese* (Heath). Perhaps the outstanding bibliographical work of the year, however, was the annotated bibliography of *Latin American Periodicals Currently Received in the Library of Congress and in the Library of the Department of Agriculture* (Government Printing Office), edited by C. Shelby. The third edition of the *Who's Who in Latin America* began with a volume on Central America (Stanford).

Among the more specialized bibliographies, L. L. Barrett published "Theses Dealing with Hispano-American Language and Literature—1944" (*Hisp,* 210-211); in "Círculos literarios de Iberoamérica" (*RI,* 297-323), José Sánchez gave a valuable account of the work of the many literary societies in Spanish America and Brazil, with a note on leading personalities and the reviews published; S. E. Leavitt surveyed "Latin American Literature in the United States: Retrospect and Prospect" (*SP,* 716-722); W. K. Jones published "Latin America Through Drama in English: A Bibliography" (*Hisp,* 220-227); the second and third parts of J. E. Englekirk's valuable "Obras norteamericanas en traducción española" (*RI,* 125-166) covered work in the social and natural sciences, completing the author's earlier bibliography of literary works. A final bibliographical study of a Mexican short story writer was R. Rosaldo's

"Notas bibliográficas sobre la obra poética de D. José María Roa Bárcena" (*RI*, 381-389).

LANGUAGE

General.—In "Reflections on the Origin of the Romance Languages" (*RR*, 235-239), M. A. Pei concluded that "the big linguistic changes that mark the Romance world are apparently of a . . . date that seems to come close to their actual appearance in recorded form." E. D. Seeber gave an interesting historical account of the interest in artificial language as manifested in the works of authors of imaginary voyages and Utopias, in his "Ideal Languages in the French and English Imaginary Voyage" (*PMLA*, 586-597). W. Rice sought a basis for the use of the subjunctive in his "The Psychology of the Subjunctive in French and Spanish" (*MLJ*, 26-36). W. M. Day narrated "The History of *Studies in Philology*" (*SP*, 381-384).

French.—Among the year's studies in grammar were: H. C. Lancaster's "*Avant de* plus the Infinitive" (*MLN*, 401-404); J. C. Palamountain's "Notes on the Interrogative" (*MLJ*, 117-126) with its survey of a number of modern plays and novels to determine the order of words in questions in contemporary French; C. S. Parker's "Notes on French Usage (IV). Partitive Construction with Adjective before Noun" (*MLJ*, 529-532); and the "Notes sur la traduction du pronom personnel anglais sujet de la troisième personne" by R. Hardé and M. K. Hooke (*FR*, 11-23).

L. C. Yedlicka studied *Expressions of the Linguistic Area of Repentance and Remorse in Old French* (Catholic University). R. H. Hall described the grammatical inflection of substantives in "Colloquial French Substantive Inflection" (*FR*, 42-51); P. Delattre studied "Prononciation graphique et prononciation phonétique" (*FR*, 219-226, 285-296); while H. Phillips considered "Vowels of Louisiana 'Cajun' French" (*FR*, 159-162).

"French the Chief Source of English Military Words" was a study by A. M. Thompson (*FR*, 146-152). Among studies of individual words were F. M. Chambers' "Old Provençal *bederesc*" (*MLN*, 475-477); three studies by C. H. Livingston—"Old French *esverré*" (*MLN*, 319-321), "Old French *Herluïn*" (*MLN*, 178-180), and "Old French *raqueer, recoier, recoi*" (*MLN*, 522-525); and H. F. Williams' "Multiple *armes*" (*PMLA*, 598-602), with its consideration of the word *paire* as found in the expression *paire d'armes*. L. Spitzer published the following studies: "Anglo-French Etymologies" (*PQ*, 20-32 and *MLN*, 503-521); "French *mièvre*" (*MLN*, 52-54); "Un *hapax* ne peut être expliqué par la linguistique seule: *espaciun* dans *Gormont et Isembart*" (*MP*, 133-136), and "Nom de Dieu!" (*MLQ*, 243-261).

Italian.—M. A. Pei analyzed "Etruscan and Indo-European Case Endings" (*Ital*, 73-77). A. Hoare edited a *Short Italian Dictionary* (Macmillan). G. Bonfante published "Neo-grammarians and Neo-linguists: Italian *guglia*" (*RR*, 240-243) and, with A. Foulet, "Il nome di *Pantelería*" (*Ital*, 118-123). R. Levy added "Encore un mot sur l'italien *carapignarsi*" (*SP*, 764-768).

Portuguese.—A useful *Graded Word Book of Brazilian Portuguese* was published by C. B. Brown, *et al.* (Crofts), while M. Merryman published in Brazil his *Portuguese, A Portrait of the Language of Brazil*, which has been described as "a treatise on linguistics that you can actually use for bedtime reading—with more than one chuckle as you read." L. L. Barrett studied the "Position of the Brazilian Pronoun Object of the Infinitive" (*HR*, 340-346), and R. A. Hall, Jr. considered "Brazilian Portuguese Inflection" (*HR*, 231-242). L. Spitzer commented upon "Portuguese *iguaria*" (*L*, 98-99).

Spanish.—C. E. Kany's *American Spanish Syntax* (Chicago) was a valuable work of the year. Among other studies of grammar were: D. L. Bolinger's "Neuter *todo*, substantive" (*Hisp*, 78-80); R. K. Spaulding's "Is Accusative 'le' only Castilian or Northern too?" (*HR*, 336-340); and F. S. Spurr's "Further Reflections on *ser* and *estar*" (*Hisp,* 379-382). In a scholarly article M. Romera-Navarro studied "Ortografía Graciana" (*HR,* 125-144).

Among the word studies were C. E. Kany's "American Spanish *recién*" (*HR,* 169-173) and his "American Spanish *no más*" (*HR,* 72-79); L. B. Kiddle's *Spanish word 'jícara'* (*Tulane*); and three studies by Y. Malkiel —"The Etymology of Old Spanish 'apesgar' 'to Catch, to Press, to Weigh'" (*MLQ,* 149-160); "Old Spanish *nadi(e), otri(e)*" (*HR,* 204-230); and *The Derivation of Hispanic 'fealdad(e),' 'fieldad(e),' and 'frialdad(e)': Development of the Latin Suffixes '-antia' and '-entia' in the Romance Languages with Special Regard to Ibero-Romance* (California). L. Spitzer published "Enaziado, anaciado" (*RFH,* 160-162) and "*Lerdo* 'pesado, torpe en el andar' (Bestias), 'tardo y torpe para comprender'" (*RFH,* 43-44). Two more general studies were "I Heard It in Mexico" (*Hisp,* 228-230) by J. Adams, and T. L. Tatum's *Pan American Business Spanish* (Appleton-Century).

FRENCH LITERATURE

General.—A. G. Engstrom published a brief historical account of "The Formal Short Story in France and Its Development before 1850" (*SP,* 627-639). Two studies indicative of rising interest in French Canada and its literature were: M. Leland's "French Canada: An Example of what America Is Learning" (*MLJ,* 389-402) and the excellent *Two Solitudes* (Duell, Sloan, and Pearce) by H. MacLennan.

Three Roland studies were: "Ganelon and Roland" (*MLQ,* 263-269) by R. A. Hall, Jr.; "An Immortal Character in French literature" (*FR,* 189-195) by M. Pei; and R. N. Walpole's "The Source MS of *Charlemagne and Roland* and the Auchinleck Bookshop" (*MLN,* 22-26). F. M. Chambers wrote about the "Completion of a Text of Raïmbaut D'Aurenga" (*MLN,* 404-406), while A. Foulet sought "The Archtype of Joinville's *Vie de Saint Louis*" (*MLQ,* 77-81).

Sixteenth Century.—I. Silver published "a cursory review" of "Du Bellay and Hellenic Poetry" (*PMLA,* 66-80, 356-363, 670-681), with a study of the poet's Hellenizing program and his translations from Homer; his allusions to, and imitations of, the nonlyric poets of Greece; and his knowledge of the theory and methodology of the Greek ode. In "Du Bellay's *Olive* CXII and the *Rime diverse*" (*MLN,* 527-530), R. V. Merrill noted the poet's Italian sources and "imitations." R. J. Clements noted 12 hitherto undetected plagiarisms from Petrarch in "Desportes and Petrarch" (*RR,* 103-112). "Un symbole de l'église catholique: *Luna*" (*PMLA,* 59-65), by M. Françon, presented an explanation of certain texts of the sixteenth century, in view of the use of the moon as a symbol of the Church. J. C. Lapp published an interesting article on "An Explorer-Poet: Jean Parmentier" (*MLQ,* 83-92), who was "the first to express, in French poetry, the curiosity and enterprise, the interest in new lands, the zeal for discovery, of Renaissance man."

Seventeenth and Eighteenth Centuries.—Two studies by H. C. Lancaster were: "The Château de Richelieu and Desmaretz's *Visionnaires*" (*MLN,* 167-172), in which he concluded that the French author described his patron's real château in the play, and the valuable *Sunset, a History of Parisian Drama in the Last Years of Louis XIV, 1701-1715* (Johns Hopkins). The *Oeuvres de Charles-Michel Campion, Poète Marseillais du Dix-huitième Siècle* were published by E. D. Seeber and H. Remak (Indiana). J. Carnus considered "La conception de la nature humaine au dix-huitième siècle chez les écrivains français" (*FR,* 24-31), and E. D. Seeber published "Diderot and Chief Logan's Speech (*Frontières de Virginie*)" (*MLN,* 176-178).

Nineteenth Century.—R. Guthrie and G. E. Diller edited *French Literature and Thought Since the Revolution* (Harcourt, Brace). In an article on "Tocqueville's Later Years—A Reaffirmation of Faith" (*RR,* 113-121), S. J. Copans studied Tocqueville's faith in liberty. "Quelques lettres inédites de la période romantique" (*RR*, 32-37), published by André Delattre, were letters, mostly addressed to Sainte-Beuve, from George Sand, Royer-Collard, Molé, Mme. Desbordes-Valmore, Michelet, Lamennais, and Stendhal. E. Czoniczer noted Stendhal's plagiarisms in "Stendhal, Joinville et un conte arabe" (*MLN*, 525-527), while J. Seznec studied "Flaubert historien des hérésies, dans la *Tentation*" (*RR*, 200-221). Two studies of Daudet were: B. G. Carter's "Alphonse Daudet and Darwinism" (*MLQ*, 93-98) with a note of Darwin's influence on the French author's work; and A. R. Favreau's "Alphonse Daudet and Anselme Mathieu: Some Unedited Letters" (*RR*, 38-42), which showed evidence of Daudet's fine friendship for the Provençal poet.

G. M. Fess published "Maupassant Borrows from Himself" (*MLN*, 530-533), and A. Herman studied "Maupassant as a Source of Estaunié's Conception of Solitude". (*FR*, 141-145). In "Direct Echoes of French Poetry in Stefan George's Works" (*MLN*, 461-468), W. Vordtriede noted the influence of Baudelaire and Mallarmé, while M. Françon described the influence of Poe on Baudelaire in "Poe et Baudelaire" (*PMLA*, 841-859). B. J. Whiting's interesting article on "The English proverbs of Stéphane Mallarmé" (*RR*, 134-141) showed the poet's use of proverbs in the exercises illustrative of rules of grammar which he used in the drab business of teaching the English language.

R. P. Grant compared "The Poetry of François Coppée and Gutiérrez Nájera" (*HR*, 67-71), and S. A. Rhodes published a "Note on Gérard de Nerval's *Octavie*" (*MLN*, 172-176). Three articles by F. Baldensperger were: "L'opposition française à l'esthétique de Taine" (*RR*, 122-133); "Une nouvelle française peu connue sur le machinisme menaçant" (*MLN*, 321-323), with a note of *Mes Petites-Maisons* by Charles Barbara; and "Notes sur deux noms propres de la *Comédie Humaine*" (*MLN*, 50-52). Still another article on Balzac was J. M. Carrière's "Unnoticed Translations of Balzac in American Periodicals" (*MLN*, 234-241), which called attention to translations printed in the *New York Mirror* and the *Democratic Review*. R. G. Mahieu published *Sainte-Beuve aux Etats-Unis* (Princeton), and in "Sainte-Beuve and America" (*PMLA*, 427-436), L. MacClintock found that Sainte-Beuve's interest in America was relatively slight.

Twentieth Century.—J. Axelrad published *Anatole France. A Life Without Illusions* (Harpers). In "Le Bergsonisme de Paul Claudel" (*PMLA*, 437-462), F. Vial presented a detailed analysis of the reflection of Bergson's philosophical ideas in the work of Claudel. J. Romains wrote a "Hommage à Romain Rolland" (*FR*, 317-318), while F. Lehner wrote on "André Chamson" (*FR*, 153-158) and on "André Spire" (*BA*, 13-17). "A Recent French Adaptation of *La estrella de Sevilla*" (*RR*, 222-234), by H. L. Johnson, called attention to A. Ollivier's *L'étoile de Seville*. Two studies of Marcel Proust were the very interesting character study, "Marcel Proust ou l'angoisse créatrice" (*MP*, 212-230), by R. Vigneron, and *Proust and Painting*, by M. E. Chernowitz (International University, N. Y.).

Among the more general articles on the modern period were A. Balakian's "The Metaphysical Gamut of Surrealism" (*FR*, 202-208); E. E. Pell's "Gide and the Present Crisis" (*FR*, 213-218) as reflected in *Les Interviews Imaginaires;* and "La Sorbonne pendant l'occupation allemande" (*FR*, 7-10) by D. Mornet.

ITALIAN LITERATURE

Renaissance.—Among the Dante studies of the year were: H. D. Austin's "Dante's Metals" (*PQ*, 83-85) and "Dante's Precious Stones and Those of the Heavenly City" (*Ital*, 62-68); G. Bonfante's study of allegorical interpretation of Dante in "Ancora le tre fiere" (*Ital*, 69-72); W. P. Friederich's account of "Switzerland's Contribution to the International Appreciation of Dante Alighieri" (*SP*, 452-464); A. H. Gilbert's "Can Dante's Inferno be Exactly Charted?" (*PMLA*, 287-306); "A Classical Reference in the *Divina Commedia*" (*Ital,* 59-61) by E. W. Palm; the explanation of Love's words to the poet in a vision, given by C. S. Singleton in "Vita Nuova XII: Love's Obscure Words" (*RR,* 89-102); and, finally, the eloquent appreciation of the poet and his work in "The Living Dante" (*Ital,* 49-58), by E. H. Wilkins.

A. Lipari replied to C. S. Singleton's refutation of his thesis in "The Structure and Real Significance of the *Decameron*" (*Ital,* XXI, 117-124) in a new article "On *meaning* in the *Decameron*" (Ital, 101-108). The absentmindedness of Ariosto and resultant contradictions found in his work were noted in G. Natali's "Le distrazioni di Ludovico Ariosto" (*Ital,* 97-100). G. Giovanni studied "Agnolo Segni and a Renaissance Definition of Poetry" (*MLQ,* 167-173).

Other Studies.—F. P. Magoun, Jr. published the text of a curious pamphlet on football, "The Long-lost *Instruzione del modo del giuocare il calcio a i giovani nobili fiorentini* of 1739" (*Ital,* 14-20), and the equally strange codification of "all human actions" in the novel *Tizio o sia le vicende dell'umanitá* by Filippo de Jorio was described in "A Juridical Didactic Novel" (*PMLA,* 157-160) by F. Reichmann. In "Michele Leoni's *Venezia Salvata,* the first Italian translation of Otway's tragedy" (*Ital,* 1-13), J. Fellheimer compared the Italian translation with the original *Venice Preserved* and with the French adaptation of the play by P. A. de La Place. Two studies of Leopardi were L. A. Cotten's "Leopardi and *The City of Dreadful Night*" (*SP,* 675-689), and B. M. Woodbridge's "Leopardi and Impressionism" (*Ital,* 32-33). Y. E. Di Silvestro published *La Vita e i Romanzi di Grazia Deledda* (Pennsylvania). Finally, a study of *Pioneer Italian Teachers of Italian in the United States* was privately published by the author, H. R. Marraro.

PORTUGUESE (BRAZILIAN) LITERATURE

Manoel da S. S. Cardozo enthusiastically recommended the new periodical, *Atlântico,* in "The New Luso-Brazilian Review" (*BA,* 20-22). "There is no better means of getting a picture of the intellectual life of Brazil and Portugal." In "Pan Iberia or Pan-Lusitania?" (*BA,* 8-12), J. O. de Oliveira considered Portugal's spiritual separation from Spain and her need to improve the "intellectual and affective relationships" with Brazil. The only article to deal specifically with the literature of Portugal was A. H. Krappe's study of the influence of Schiller on the Portuguese poet Guerra Junqueiro in "O sôpro de Deus" (*MLN,* 472-475).

E. Veríssimo's brief history of *Brazilian Literature* was published by Macmillan, while two translations of Brazilian literature were S. Putnam's translation of J. Amado's *The Violent Land* (Knopf) and H. Chamberlain's translation of *Inocência,* by A. d'Escragnolle Taunay (Macmillan). A scholarly study of the work of the man who "taught the first course in Portuguese at an American (*i.e.,* U. S.) university and wrote the first Portuguese grammar published in the United States" is to be found in R. C. Smith's "A Pioneer Teacher: Father Peter Babad and His Portuguese Grammar" (*Hisp,* 330-363).

Among the studies of individual authors was D. F. Brown's "Azevedo's naturalistic version of Gautier's *La morte amoureuse*" (*HR,* 252-257), with its analysis of the way Aluízio Azevedo, in his *A Mortalha de Alzira,* transformed the plot of the Gautier story into a naturalistic novel. P. Serpa published a study of the "initiator of the naturalist novel in Brazil" in his "Manuel Antônio de Almeida" (*RI,* 325-356). In "*Os romances da Bahia,* de Jorge Amado" (*RI,* 79-83), E. E. Stowell gave an analysis of the six novels of a series reflecting life in Bahia.

SPANISH LITERATURE

Early Period.—O. K. Hauptmann noted a relationship between "The *General Estoria* of Alfonso el Sabio and Escorial Biblical Manuscript I.j.8" (*HR,* 45-59). S. G. Morley's "Chronological List of Early Spanish Ballads" (*HR,* 273-287) arranged all the earliest Spanish *romances* known, up to the year 1511, "according to the dates at which they are actually extant." In a study of "Aljamiado texts: Legal and Religious" (*HR*, 102-124), J. N. Lincoln gave an account of these MSS written in the Spanish language but in Arabic characters, and included Spanish transcriptions, with commentaries, notes, and glossary; the texts considered were four marriage contracts and three religious legends. D. C. Clarke's "Notes on Villasandino's Versification" (*HR*, 185-196) described the poet's verse as of note because it marked "the transition of Castilian versification from the Galician-Portuguese." S. Gilman published "El tiempo y el género literario en la *Celestina*" (*RFH*, 147-159).

Golden Age.—In "Deceit in Cervantes' *Novelas ejemplares*" (*HR*, 244-252), R. Frank studied the relation of deceit, as a literary device, to the form of the novels and its possible use as a clue to Cervantes' system of values at the time the stories were written. F. Aguilera described "The Kebler Addition to the Don Quixote Collection" (*Hisp*, 390-395) in the Library of Congress. Four articles on Lope de Vega were: H. L. Johnson's "A Recent French Adaptation of *La estrella de Sevilla*" (*RR*, 222-234); W. L. Fichter's "The Date of Lope de Vega's *Santiago el Verde*" (*HR*, 243-244); S. G. Morley's interpretation of the meaning of the play "El acero de Madrid" (*HR*, 166-169); and J. G. Fucilla's "A Classical Theme in Lope de Vega and G. B. Marino" (*MLN*, 287-290), with its note of the "Cupid and Bee" theme which Marino borrowed from Lope. In "Some Baroque Aspects of Tirso de Molina" (*RR*, 43-69), M. A. Peyton found Tirso to be "Baroque" because "the dramatic problem of his plays consists of principal conflicting attitudes." R. L. Kennedy studied "Contemporary Satire Against Ruiz de Alarcón as Lover" (*HR*, 145-165). In "'El Bernardo' of Balbuena: A Baroque Fantasy" (*HR*, 1-23), F. Pierce concluded: "The recent welcome change of attitude toward the literary style of the Spanish Baroque now makes it possible to mitigate much that has been said to the detriment of Balbuena and his fellow poets of the Golden Age." C. B. Beall described Mesa as "among the first Spanish poets to make translations . . . from Tasso's *Rime*" in his "Cristóbal de Mesa and Tasso's *Rime*" (*MLN*, 469-472). In a study of "Some Poetic Favorites of Salas Barbadillo" (*HR*, 24-44), G. G. LaGrone discussed the author's effective use of poetic quotation.

Modern Period.—N. B. Adams published "Notes on Dramatic Criticism in Madrid: 1828-1833" (*SP*, 609-616), calling attention to an increasing conflict between neo-classicism and romanticism as seen through criticism of numerous foreign works appearing in translation and, especially, in plays. In a study of "Emilia Pardo Bazán as a dramatist" (*MLQ*, 161-166), J. H. Nunemaker concluded that her plays well deserved the oblivion to which they have been consigned.

In "El carácter tradicional de *El Afrancesado* de Alarcón" (*RFH*, 162-163), W. L. Fichter noted as the source of the story an episode in the *Guerras civiles* by the Roman historian, Apiano. H. Sáenz studied the "Ideario Galdosiano" (*Hisp*, 364-369), and R. F. Brown's "The Romantic Novel in Catalonia" (*HR*, 294-323) begged a "sympathetic consideration" of three novels—*Los Terremotos de Orihuela*, by Estanislao de Cosca Vayo and Juan Cortada's *Lorenzo* and *El Templario y la Villana*. J. Jiménez Rueda studied the work of "Enrique Díez-Canedo" (*RI*, 391-392) and called attention to his friendship for Hispanic America.

In poetry, J. K. Leslie's "Towards the Vindication of Zorrilla: The Dumas—Zorrilla Question Again" (*HR*, 288-293) presented evidence in an attempt to indicate "that Zorrilla should be credited with the one great romantic, religious innovation of the nineteenth century in the Don Juan theme." Two studies of modern Spanish poets were C. Clavería's "Notas sobre la poética de Antonio Machado" (*Hisp*, 166-183), and H. Brickell's "A Spanish Poet in New York" (*Va. Quart. Rev.*, No. 3), with its personal memories of Federico García Lorca. A notable work in translation was E. L. Turnbull's *Contemporary Spanish Poetry: Selections from Ten Poets* (Johns Hopkins).

SPANISH AMERICAN LITERATURE

The outstanding book of the year and one of the most valuable in the Romance field was P. Henríquez Ureña's *Literary Currents in Hispanic America* (Harvard). W. Berrien's "A Significant Anniversary" (*Hisp,* 5-8) called attention to Joaquín García Monge's 25-year editorship of the *Repertorio Americano.* Letters evaluating the work of the famous Mexican were published in a symposium, "Our Alfonso Reyes" (*BA,* 111-14). R. W. Stallman published a fascinating account of "Robert Cunninghame Graham's South American Sketches" (*Hisp,* 69-75), while R. J. Niess noted "Federico Gamboa: The Novelist as Autobiographer" (*HR,* 346-351) with especial reference to the novel, *Reconquista.* A study of the literary work of Ricardo Palma and Abraham Valdelomar was published by E. Núñez in "A los 25 años de la desaparición de dos grandes escritores peruanos" (*RI,* 287-296), and F. Díez de Medina studied a creation myth of the Andes in "El tiempo mítico" (*RI,* 25-31). R. E. Warner noted "Mexican Pseudonyms and Initials" (*HR,* 324-335). Translations of Spanish American prose published during the year were: R. Palma's *Knights of the Cape,* by H. de Onís (Knopf); R. Rojas' *San Martín, Knight of the Andes,* by H. Brickell and C. Videla (Doubleday, Doran); and A. Costa du Rels' *Bewitched Lands,* by S. E. Grummon (Knopf).

In poetry, the best work of the year was the English translation of Ercilla's *La Araucana,* by C. M. Lancaster and P. T. Manchester (Vanderbilt). Three studies of Andrés Bello were: P. Grases' "Don Andrés Bello y el Poema del Cid" (*RI,* 243-286); W. H. Bohning's article on "Andrés Bello's Imitations of Victor Hugo" (*HR,* 60-67); and M. Romera-Navarro's "Un soneto de Heredia atribuído a Bello" (*HR,* 197-203). C. Carpio's "Ideas estéticas en las Antologías de Carlos García Prada" (*RI,* 209-215) is a study of particular value because of its survey of García Prada's analysis of the Colombian poetry he knows so well. Studies of two individual Colombian poets were J. Arango Ferrer's "Germán Pardo García, o El poeta de la desolación" (*RI,* 33-44), and N. Bayona Posada's "Rafael Pombo" (*RI,* 217-241). A valuable little anthology of "22 Poemas" by A. Torres Ríoseco was published (*RI,* 173-200), with an excellent introductory study of the personality and poetic work of the Chilean poet by C. García Prada (*RI,* 167-172). J. Mallo wrote of "Las relaciones personales y literarias entre Darío y Unamuno" (*RI,* 61-72), and E. Santandreu Morales published an interpretive study of the Uruguayan poetess in her "Delmira Agustini, Ala y llama" (*RI,* 45-59). J. B. Rael's "Un cantar hallado en Tucumán" (*RI,* 73-77) compared versions found in New Mexico and Colorado with that of Argentina.

There was a rather notable increase of interest in 1945 in the Spanish American theatre. H. Kurz made a valuable contribution to the study of the Argentine theatre in his "The *Cuadernos* of the Instituto Nacional de Estudios de Teatro" (*Hisp,* 212-219). Equally valuable were "Notes on Puppetry in Mexico" (*Hisp,* 199-207), by A. M. Coe, and J. K. Leslie's "Italian Plays and Players in Montevideo (1835-1845)" (*Ital,* 124-132). A critical article, long needed because of its sober consideration of the weakness as well as of the strength in the work of the dramatist, was J. P. Echagüe's "Florencio Sânchez" (*RI,* 9-24), and T. Apstein wrote of "Samuel Eichelbaum, Argentine Playwright" (*BA,* 237241), giving the plots of several plays.

COMPARATIVE LITERATURE

"Comparative Literature; Past and Future, American Colleges and Universities" (*SP,* 440-451), with its account of the scientific approach to the comparative study of literature and a brief history of such study in the United States, was published by U. T. Holmes, Jr. R. H. Cline studied "The Influence of Romances on Tournaments of the Middle Ages" (*S*, 204-211), while E. G. Mathews followed "The Murdered Substitute Tale" (*MLQ*, 187-195) through different literatures. "Perceval's Father and Welsh Tradition" (*RR*, 3-31), by H. Newstead, and two articles by R. S. Loomis—"The Combat at the Ford in *Dido Perceval* (*MP*, 63-71) and "Morgain la Fée and the Celtic goddesses" (*S*, 183-203)—were studies of the important contribution of Welsh legend to the shaping of Arthurian romance. Two studies of the influence of French literature on Chaucer were: J. Parr's "Chaucer and *Partonope of Blois*" (*MLN*, 486-487) and R. M. Smith's "Chaucer's 'Castle in Spain' (HF 1117)" (*MLN*, 39-40). G. Fellheimer noted the influence of Guicciardini on Holinshed by way of Fenton's translation of the Italian *Storia d'Italia*, in his "Geoffrey Fenton's *Historie of Guicciardini* and Holinshed's *Chronicles* of 1587" (*MLQ*, 285-298). Two other studies of literary influence were: "The *Manuel des Péchés* and an English Episcopal Decree" (*MLN*, 439-447), by D. W. Robertson, Jr., and B. J. Whiting's comparison of *La farce du raporteur* with *Gammer Gurton's Needle* in "Diccon's French cousin" (*SP*, 31-40). D. F. Atkinson identified "One R. P." (*MLQ*, 3-12) as a Robert Parke, author of a series of Elizabethan translations from the Spanish. In "Pope and Malebranche: A Note on the *Essay on Criticism*" (*PQ*, 65-70), V. M. Hamm called attention to Pope's indebtedness to the French author, and, in the modern period, S. Ezban's "Maurice Baring et la France" (*PMLA*, 503-516) noted the enthusiastic appreciation of the French language and literature of that English author.

LATIN LITERATURE*

By GEORGE DEPUE HADZSITS

PROFESSOR, UNIVERSITY OF PENNSYLVANIA AND JOHNS HOPKINS UNIVERSITY

INTRODUCTORY

The vitality of classical scholarship was strikingly illustrated by the highly successful meetings of the American Philological Association and of the American Archaeological Institute, held in Cincinnati Dec. 27-29, the first regular meetings of these societies since the war.

The fate of the "Liberal Arts College", is still the concern of all thoughtful people, and that fate is closely associated with the future of "classical" studies.

Mark van Doren's *Liberal Education* will, no doubt, be quoted frequently, and the Harvard Report on *General Education in a Free Society* (*C J*. 41, 87-89) will exert a wide influence. *An Analytic Definition of Liberal Education*, by N. B. Johnson (*C J*. 41, 12-15) deserves a wide reading because of its emphasis on the perspectives that a liberal education must have. Without these, our "Liberal Arts College" shall be lost.

Although appearing before 1945, special mention should be made of Ralph Turner's *The Great Cultural*

---

* Periodicals are abbreviated as follows: A H R, *American Historical Rev.*; A J A, *American Journal of Archaeology*; A J P, *American Journal of Philology*; C B, *Classical Bulletin*; C J, *Classical Journal*; C O, *Classical Outlook*; C P, *Classical Philology*; C Q, *Classical Quarterly*; C R, *Classical Rev.*; C W, *Classical Weekly*; H S C P, *Harvard Studies in Classical Philology*; H Th R, *Harvard Theological Rev.*; Is., *Isis*; J H I, *Journal of History of Ideas*; J R S, *Journal of Roman Studies*; Lang., *Language*; Ph Q, *Philological Quarterly*; Spec., *Speculum*; P A P A, *Proceedings of the American Philological Association*; T A P A, *Transactions* of the same; Verg., *Vergilius*; Y C S, *Yale Classical Studies* (all references are to 1942).

Biographical information will be found in lists of "Recent Publications," appearing in *C W*, and in "Recent Books," listed in *C J*, as well as under "Classical Articles in Non-Classical Periodicals" which *C J* also publishes.

Traditions (McGraw-Hill), which has been called "the most provocative and stimulating work" since Benjamin Farrington's *Science and Politics in the Ancient World (cf,* rev., *C.J.* 40, 234-238.)

Henry Harmon Chamberlin writes in spirited fashion in defense of classical and cultural education *(C.J.* 40, 321-330), leaving us only two alternatives, "Classics or Chaos." Another stirring defense is that of Dorothy Thompson (*C.O.* 22, 65-66), entitled "The Classics in American Education."

"Classicism as a Contemporary Guide," by Prof. W. R. Agard *(C.J.* 40, 387-397) is a valuable contribution to the literature on the importance of maintenance of classical studies, written by the author of *Medical Latin and Greek* (P. B. Hoeber, N. Y.) and of *What Democracy Meant to the Greeks* (Univ. of North Carolina Press).

The topic of "Latin as an International Auxiliary Language" is ably discussed (*C.O.* 22, 49-50) by Norman J. DeWitt, and a brilliant article on the same subject (*C.O.* 22, 85-86) is by that accomplished Latinist, Goodwin B. Beach, who has demonstrated the practical and the possible use of Latin in Colloquial speech.

LITERATURE

H. Fränkel's *Ovid, A Poet Between Two Worlds* (Univ. of California Press) is a brilliant book that will go far in creating a proper estimate of that extraordinary poet about whom successive centuries have held widely divergent views. It is a great achievement to assess his value for the twentieth century *(cf.,* also, E. K. Rand, *Ovid and His Influence,* Longmans, Green).

Prof. E. Adelaide Hahn writes on "The Characters in the *Eclogues*" (*TAPA* 75, 196-241) and argues that Octavian is the *iuvenis* of *Eclogue 1,* that Julia is the *puer* of *Eclogue 4,* that Daphnis in *5* is Julius, that Silenus in *6* is Siro, while a number of characters are thought to represent Vigil. Professor Hahn writes, as usual, with remarkable learning, this time, on topics often discussed before, but with well-fortified conclusions of her own about these problems and also about the chronology of the Eclogues. For another very important discussion of some of these problems, see Prof. E. L. Highbarger, "Notes on Vergil's *Bucolics*" (*C.P.* 40, 43-45).

Agnes Kirsopp Lake Michels writes on "The Golden Bough of Plato" (*A.J.P.* 66, 59-63), arguing for her theory that the golden bough of Virgil's Sixth *Aeneid* is not a bit of folklore at all, but a literary allusion, whereby she maintains that Virgil used Plato and the device of a myth as a means of indicating Aeneas' journey to Hades, a mere dream.

"The *Bucolics* and the Medieval Poetical Debate," by Betty Nye Hedberg (*TAPA* 75, 47-67), argues, convincingly, that "contrary to general assumption, the pastoral singing contest and the medieval debate have only a superficial similarity." Such studies as this are exhibitions of the most critical scholarship that undertakes, in this case, to trace the literary lineage of an important medieval practice and relate it to the proper classical antecedent of poetical debate in the rhetorical schools.

As stated in THE AMERICAN YEAR BOOK (1944, p. 915), W. C. Greene prepared a most timely article on "Some Ancient Attitudes toward War and Peace." In his study of "War in the *Aeneid*" (*C.J.* 40, 261-273), W. H. Alexander also reminds us of some valuable lessons to be learned from ancient sources, going so far as to claim that the *Aeneid* is an excellent commentary on Napoleon's testimony on war! It will surprise the nonclassical reader to learn that Virgil pays heed to diplomatic and political maneuvers, to propaganda, to the questions of industry and warfare, to the medical corps (cf., also, "Virgil and War in the *Aeneid*," *C.J.* 41, 104-107), by George E. Duckworth, who argues the point that Virgil was, however, not a militarist, but a lover of peace.

"Some Sound-Effects in Virgil," by S. Whateley, in *Greece and Rome*

(14, 17-28), establishes the thesis that the poet was abnormally sensitive to sounds and sensitively aware of the *discors concordia* of Nature.

"We Want a Vergilian Peace," by B. L. Ullman (*C.J.* 41, 1-3), is the ringing title of a stimulating essay.

R. C. Trevelyan, in *Translation* of *Virgil: Eclogues* and *Georgics* (Cambridge Univ. Press), demonstrates that he is at once a fine classical scholar and distinguished translator.

The Death of Virgil, by Herman Broch (Pantheon Books, New York), translated by Jean Starr Untermeyer, is a memorable account of Virgil's broodings on life and death in the last 24 hours of his life.

In his "What are *teretis plagas* (Horace, *Odes* 1.1.28)," Dr. William Hardy Alexander (*TAPA* 75, 15-19) boldly suggests a new interpretation of a well-known passage in Horace. It will be necessary in the future to include among older interpretations the suggestion that *teretis* means "bulging," because of Dr. Alexander's keen and incisive study of a group of words concerned with an exciting moment in boar-hunting.

H. B. Jaffee, *Horace: An Essay in Poetic Therapy* (Univ. of Chicago Diss.), (*C.P.* 40, 50-52) is concerned with Horace, as artist and moralist (a critical rev. appears in the *C.W.* 38, 132).

W. H. Alexander continues his *Seneca's Dialogues* (Univ. of California Press)—*The Text Emended and Explained* (*C.W.* 38, 195-196, *cf.* also, his illuminating "Seneca's *ad Polybium de Consolatione*; a Reappraisal," *Trans. of the Royal Society of Canada,* 37, 33-35).

J. M. K. Martin *Greece and Rome* (14, 64-71) discusses "Seneca the Satirist" and, in particular, analyzes the meaning of the baffling essay *Apocolocyntosis.*

An excellent literary article on "Poets and Philosophers" by O. J. Todd (*C.J.* 41, 49-71) discusses, among other interesting topics, poets and their own prophecies of renown. O. J. Todd also writes on "Charon, the *Portitor*" (*C.P.* 40, 243), an interesting exposition of the semasiological development of the word *portitor,* the boatman, and the toll-gatherer.

"Notes on Tacitus," *i.e.,* his style, by G. B. A. Fletcher (*A.J.P.* 66, 13-33), is penetrating and thought-provoking.

Latin Pseudepigrapha—A Study in Literary Attributions, by Evelyn Holst Clift, is a remarkable achievement. It is a study of a great number and variety of literary productions, from the Plautine period into the Augustan Age, undertaken to prove the authenticity or the false attribution of these works to authors associated with them, and to clarify the reasons for such association (Furst, Baltimore).

"Notes on the Style and Vocabulary of Cassiodorus' *Institutiones*" (*C.P.* 40, 24-31) is an important analysis of the literary technique of the man who transformed the monastery into a theological school, by Prof. L. W. Jones, the well-known medievalist (*cf.* "Where are the Prickings?"—later, in this review).

In "The Library of the Angevin Kings at Naples," Cornelia C. Coulter (*TAPA* 75, 141-155) discusses the significance of the books and other materials in the Neapolitan library for the years A.D. 1280-1342, for our knowledge of the intellectual interests of the time. This was the period of the finest Neapolitan culture in the Middle Ages. Her most interesting discussion of many acquisitions includes devotional and liturgical books, and theological works; involves references to eminent personalities, as Thomas Aquinas and Marco Polo; records the relatively few classical texts available there; and suggests, also, the possible influence of this library upon the early life of Boccaccio.

HISTORY

Another *History of the Roman World* has appeared. Every year witnesses the production of such works, which are the best possible proof of the recognized need of knowledge of the historical development of the ancient world—for our present world. The author is E. T. Salmon, who traces that history from 30 B. C. to A. D. 138 (the sixth volume in the notable *Macmillan History of the Greek and Roman World Series;* rev., in *C.W.* 38, 164-166). Mention should be made here of *Modern Problems in the Ancient World* (Univ. of Texas Press), by F. B. Marsh (*A.J.P.* 66, 69-70).

Prof. W. L. Westermann's brilliant "Between Slavery and Freedom" (*A.H.R.* 50, 213-227), analyzes definitions of these terms and their application to economics, politics, etc. (*cf.*, also, his "Slave Maintenance and Slave Revolts," in *C.P.* 40, 1-10).

Elias J. Bickerman's fascinating "An Oath of Hannibal" (*TAPA* 75, 87-102) is an examination of the Greek text of this Oath, as it appears in Polybius, with a view to proving that the text we have is an official translation from the Punic. The great importance of this observation will be evident to all, and Dr. Bickerman proposes to discuss later the diplomatic and religious features of the Oath. His "*Bellum Philippicum:* Causes of the Second Macedonian War" (*C.P.* 40, 137-148) is particularly valuable for giving both Greek and Roman views.

G. C. Richards' "Polybius of Megalopolis, the great Admirer of Rome" (*C.J.* 40, 274-291) admirably sets forth the importance of the Greek historian, as the first and greatest apologist of Rome who tried to reconcile Greece to her fate.

Prof. Eva M. Sanford contributes a learned article on "Roman Business Men in the Provinces," which is of first importance for all students of economic history (*C.O.* 22, 33-35).

In the journal, *Greece and Rome,* the distinguished classical scholar, F. E. Adcock, author of *The Roman Art of War, under the Republic,* discusses a theme of perennial interest, "Women in Roman Life and Letters," (*G. and R.* 14, 1-11).

Currency in Roman and Byzantine Egypt, by L. C. West and A. C. Johnson, is another production of the Princeton University Press, in the *Princeton University Studies in Papyrology.*

C. H. V. Sutherland, "*Aerarium* and *Fiscus* during the Early Empire, Augustus to Trajan" (*A.J.P.* 66, 151-170) is another important study of imperial finances.

"Comment and Conjecture on Military Topics" (*C.W.* 38, 188-191) includes the interesting article of Prof. S. L. Mohler, on "Caesar and Channel Tides."

"Picturesque Ways of Estimating and Suggesting the Size of Huge Armies" is both informing and entertaining, as is all of the work of Dr. Eugene S. McCartney (*C.J.* 40, 358-364).

Alfred Powers, *Hannibal's Elephants* (Longmans, Green), is significant for students of warfare.

Walter Allen's "Cicero's House and *Libertas*" (*TAPA* 75, 1-9) is an exceedingly interesting discussion of the bitter feud between Cicero and Clodius which had resulted in Cicero's banishment in 58 B.C. Dr. Allen analyzes the motives that led Clodius to erect a shrine to *libertas* on part of the site of Cicero's appropriated Palatine home and likewise explains Cicero's motives in seeking to recover and rebuild his home and remove the sting involved in the charges against his reputed tyrannical procedure.

In her scholarly study of "The Learned Professions in the Theodosian Code," E. M. Sanford adds to her reputation as an historical student and adds to our knowledge of the provisions that were made for state physicians, grammarians, teachers, and students who came to Rome. It is especially interesting to observe that at the University in Constantinople a full classical curriculum was preserved by a Christian Emperor (*C.J.* 40, 544-552). Prof. Clyde Pharr writes with authority on "The Text and Interpretation of the Theodosian Code" (*A.J.P.* 66, 50-58), and on "The Text of Gratian's *Decretum*" (*A.J.P.* 66, 255-265).

"Sparsiones" is the title of a brilliant study of an institution in ancient Rome, not sufficiently well-known even by scholars. Hugh Nibley discusses the practices and the actors of this symbolic ceremony, which was a heritage of the Golden Age and which has counterparts in many later Christian ceremonies (*C.J.* 40, 515-543).

PAPYRI

C. W. Keyes, H. Liebesny, and W. L. Westermann's *Columbia Papyri* (Columbia Univ. Press) is praised as of the "highest quality" (*C.J.* 40, 367-369), as is *Currency in Roman and Byzantine Egypt* (mentioned previously), by West and Johnson (another work in papyrology).

Papyri and Ostraca from Karanis (vol. vi of the *Michigan Papyri,* Un. of Michigan Press), by H. C. Youtie and O. M. Pearl, maintains the high standard of these well-known scholars.

"Evidences of Christianity in Egypt during the Roman Period" H. I. Bell, argues for the existence of a Christian community at Alexandria in the first century, which is much earlier than had been previously supposed. The author cites Biblical and theological texts on papyri as evidence of the earlier development of Christian minorities, however small, which prepared the way for the predominantly Christian population of the fourth century (*H. Th. R.* 37, 185-208).

RELIGION AND PHILOSOPHY

Prof. Eugene Tavenner presents a valuable study of "Roman Religion with Especial Relation to Vergil" (*C.J.* 40, 198-220). As all students of Roman Religion know, the religious experience of the Romans developed through manifold phases from primitivism to a highly developed form of belief and cult. Dr. Tavenner's article clarifies the religion of the Romans, as reflected in Virgil's poetry, in the light of that long experience.

The excellent review, by D. M. Robinson, of R. Lattimore's *Themes in Greek and Latin Epitaphs* (*C.J.* 41, 38-41) is as illuminating as the book itself and both should be read for the interpretations of Death and the attitudes toward Death, as reflected in the ancient inscriptions. The subject is one of prime interest to the student of Christian thought.

Prof. Ruth Ellis Messenger adds to her reputation as a foremost scholar in the field of hymnology by her article, "The Mozarabic Hymnal" (*TAPA* 75, 103-126), which presents a study of Latin hymns used in medieval Spain before A.D. 1085. The importance of this fine study lies in a revelation of the culture and historical environment these hymns offer and, consequently, the light they throw upon a period of the "Dark Ages."

"Comment and Conjecture on Virgil" (*C.W.* 38, 170-172) includes a brief but significant discussion of "Piety in the Character of Aeneas." J. W. Hritzu argues for development in degree of piety (or, devotion to deity) of the hero, Aeneas.

Margaret Bieber's interesting article, "Honos and Virtus" (*A.J.A.* 49, 25-34) discusses the two figures guiding the horses of the quadriga in the procession, represented in the famous and beautiful reliefs of the Arch of Titus.

LINGUISTIC AND ARCHAEOLOGICAL

"Ictus, Accent, and Statistics in Latin Dramatic Verse" raises some questions and offers some tentative answers about problems that are very troublesome to students of Latin verse. Among other conclusions, Prof. Kenneth M. Abbott rejects the theory of stress ictus in Latin verse. Yet ictus variations from the position of the word accent are recognized in a paper that is humorous, provocative, and scholarly (*TAPA* 75, 127-140), (*cf.,* his equally learned paper on "The Grammarians and the Latin Accent" in the *Oldfather Studies,* noticed in The American Year Book, 1944, p. 917).

Meriwether Stuart discusses "A Faience of Augustus" (*A.J.A.* 48, 171-175). It is regarded as an unmistakable portrait of Augustus, found in Egypt, now in the Metropolitan Museum of Art.

A most timely and, likewise, valuable article is that of Miss R. L. Deutsch, "The Ancient and Modern Atom" (*C.J.* 41, 97-103). It well illustrates the need of our knowing the history of science in order to realize the proper relation between scientific progress and social progress (*cf.* K. C. Bailey, *The Elder Pliny's Chapters on Chemical Subjects,* London, Arnold).

Bruno Meinecke's "The Medical Conceptions of a Roman Layman" is an extremely interesting study of Cicero's knowledge of and attitude toward current medical knowledge and practices (*C.J.* 41, 113-118).

"Where are the Prickings?" is the title of Dr. Leslie Webber Jones' article (*TAPA* 75, 71-86), which calls attention to the importance of these "prickings" for palaeographers in order to determine the dates of manuscripts all the way from *ca.* 300 to *ca.* 1300 A.D.; the country the manuscripts came from; the *scriptorium;* and even the scribe. Dr. Jones raises a study of these punctures in the manuscript page to the level of a severe science and, in doing so, follows the lead of the late Edward Kennard Rand.

BRIEF MENTION

"Laudatores Temporis Acti," in Latin literature by Edmund Hunt (*C.J.* 40, 221-233). J. N. Hough, "The *Numquid Vis* Formula in Roman Comedy" (*A.J.P.* 66, 282-302). "The Meaning and Use of *Sed Enim*", by Prof. Joseph Fontenrose (*TAPA* 75, 168-195). "The Genitive Absolute in Latin," E. L. Bassett (*C.P.* 40, 108-114). Christopher M. Dawson, *Romano-Campanian Mythological Landscape Painting* (Yale Classical Studies, IX). F. W. Beare, "Books and Publication in the Ancient World" (*University of Toronto Quarterly* 14, 150-167). *Documents of Dying Paganism: Textiles of Late Antiquity in Washington, New York, and Leningrad,* by Paul Friedländer (Univ. of California Press—for an excellent review of this important study, see *J.R.S.* 35, 132-133). N. W. DeWitt writes an illuminating essay in the *University of Toronto Quarterly* (14, 250-255) on "Epicureanism and Christianity." H. Mattingly, "The First Age of Roman Coinage" (*J.R.S.* 35, 65-77) is authoritative and interesting.

It is a pleasure to announce the appearance of a new Classical periodical: *Traditio: Studies in Ancient and Medieval History, Thought, and Religion,* (for description, *cf.* *C.P.* 40, 57-58).

GREEK LITERATURE

By Royal Case Nemiah
Professor, Dartmouth College

GENERAL

The year 1945 saw a further decline in both the quantity and quality of the work in the field of Greek studies. Owing to the blighting effect of war, the "raw materials" for investigation have been cut off, as is particularly apparent in the field of archaeology. The impossibility of international cooperation among scholars has been a serious barrier in the way of progress in research in Greek studies as well as in other areas of advanced study, though, on the credit side of the account should be mentioned the increased number of foreign scholars now engaged in investigation in this country. As evidence of the small volume of production in this field may be mentioned the fact that only one new volume appeared in the Loeb Library (Greek Series No. 373): the third volume of *Isocrates* by L. Van Hook. With the end of the war, the increased facilities in communication, and the release of many scholars from war duties, we may look forward hopefully to an increased volume of significant contributions to Greek scholarship.*

LITERATURE AND LITERARY CRITICISM

Critical investigation of the manuscript tradition of an author is always an important event in classical philology. Following up his fine work on Aeschylus (*cf.* THE AMERICAN YEAR BOOK, 1944, 918), A. Turyn contributes "The Manuscripts of Sophocles" to *Traditio* (2, 1), a sound contribution to Sophoclean scholarship. He has also published a critical edition of Pindar, *Pindari Epinicia* (*Polish Institute Series, No. 5*). A contribution to the ultimate solving of the riddle of the Minoan language is A. E. Kober's "Evidence of Inflection in the 'Chariot' tablets from Knossos" (*AJA* 49, 143).

HOMER

A distinguished addition to the long line of translations of Homer is Smith and Miller's *Iliad of Homer* (Macmillan, 1944), a line-for-line version in dactylic hexameters. G. M. Bolling in "Movable *Nu* at the End of Homeric Verses" (*CP,* 40, 181), shows that ancient usage in this matter was varied; that Ptolemaic scribes used *Nu* to indicate a pause at the end of a verse. J. A. Scott in "Homer and Hector" (*AJP,* 66, 187) maintains that Hector did not belong to the pre-Homeric tradition but was a creation of Homer. P. C. Wilson (*CP,* 40, 45) comments on *Iliad I,* 116ff.

LYRIC AND DRAMATIC POETRY

W. C. McDermott (*CJ,* 40, 168) comments on Simonides frg. 92, the epigram on the Spartans who died at Thermopylae, and on Cicero's translation of it. R. A. Lattimore (*CP,* 40, 121f.) has a note on the interpretation of Pindar's *Nemean Ode 7* (70-74). A noteworthy publication in this field is G. Norwood's *Pindar* (Univ. of Calif. Press, 1945). An excellent book on the whole field of ancient drama, both Greek and Latin, is P. W. Harsh's *A Handbook of Classical Drama* (Stanford Univ. Press, 1944). H. W. Miller, in an interesting article entitled "Medical Terminology in Tragedy" (*TAPA,* 75, 156), notes the influence of medical vocabulary on that of tragedy. R. A. Lattimore (*AJP,* 66, 313) has two notes on the text of the *Agamemnon* of Aeschylus, (vv. 555-557 and 575-579). P. H. Epps in "Sophocles: Mere Conservative or True See-R?" (*SPUNC,* 42, 427) discusses Sophocles from the point of view of Matthew Arnold's criticism. H. W. Miller has a note on "Conversational Idiom in Aristophanes" (*CW,* 38, 162), and W. A. Clebsch (*ibid.* 163) an emendation of A's *Lysistrata* (1174).

MISCELLANEOUS AUTHORS

S. Wilcox again (*cf.* THE AMERICAN YEAR BOOK, 1944, 918) comes to the defense of the rhetoricians in his "Isocrates' Fellow Rhetoricians" (*AJP,* 66, 171). The rhetoricians' chief aim, he says, was not to give instruction in writing forensic speeches but to produce statesmen, writers, and gentlemen of culture. They were not teachers of chicanery and deceit. E. H. Haight continues her work in ancient fiction in *More Essays on Greek Romances* (Longmans, Green, 1945), in which she treats of early fiction, the Alexandrian romance, and Boccaccio's debt to Apuleius. P. A. Clement (*AJP,* 66, 192) tries to fill up a lacuna in Plutarch's version of Aesop's fable of the *Fox and the Crane.* (Plutarch's *Moralia,* 614E). F. W. Lenz, in "The Monkeys of Archilochus" (*AJP,* 66, 34), attempts to explain an obscure passage in Aristides (II, 397, 3ff. ed. Dindorf) by use of the scholia and a reference to Aesop. R. Mandra in "Theocritean Resemblances" (*PAPA,* xxvi) makes a study of Theocritus (1-15) and indicates survivals from his time to present day Sicily.

LITERARY STUDIES

A most distinguished work in this field is W. C. Greene's *Moira: Fate, Good, and Evil in Greek Thought* (Harvard Univ. Press, 1944), in which he traces these spiritual forces throughout Greek literature and philosophy. O. J. Todd, in "Poets and Philosophers" (*CJ*, 41, 49), studies the relationship of philosophy and poetry in Greek and Latin literature. C. M. Dawson and A. E. Raubitschek, in "A Greek Folksong Copied for Lord Byron" (*Hes.* 14, 35), give the original text, translation, and Byron's first draft of his *Translation of the Romaic Song, etc.,* together with introduction and commentary; also the original Greek text of his *Translation of a Romaic Love Song.*

PHILOSOPHY

As is natural, the major portion of the work in Greek philosophy is to be found in studies in Plato and Aristotle. It is to be hoped that in the near future, without slighting these fields, more attention will be devoted to Presocratic philosophy and the post-Aristotelian schools. In this latter field is to be noted a paper by K. von Fritz, "Nous and Noein and Their Derivatives in Presocratic Philosophy (excluding Anaxagoras). Part I, From the Beginnings to Parmenides (Xenophanes, Heraclitus, Parmenides)" (*CP*, 40, 223). This is a continuation of a similar treatment of "Nous and Noein in the Homeric Poems" (*cf.* THE AMERICAN YEAR BOOK, 1943, 894).

A very interesting article on "Pythagorean Communism" by E. L. Minar, Jr. (*TAPA*, 75, 34) should be noted. The first part of L. Spitzer's "Classical and Christian Ideas of World Harmony" (*Trad.* 2, 409) and R. Allers' "Microcosmus from Anaximandros to Paracelsus" (*Ibid.* 319) should be included here.

Notable work in the field of Plato and Aristotle has been done by H. F. Cherniss in two books: *Aristotle's Criticism of Plato and the Academy* (Baltimore, Johns Hopkins Press, 1944) and *The Riddle of the Early Academy* (Univ. of Cal. Press, 1945). In "Plato and Poetry" (*CJ*, 40, 481), T. S. Duncan writes on Plato's views as to the nature of poetry and its value (or lack of value) to the state. Noteworthy is the two-volume work of Hugo Perls: *Platon: Sa Conception du Kosmos* (Editions de la Maison Française, N. Y., 1945). R. G. Hoerber in *The Theme of Plato's Republic* (Diss. Washington Univ., St. Louis, 1944) tries to prove, but not too effectively, that the Republic deals with the effect of justice and injustice on the soul and that the state is used merely as an example. C. J. Treacy in "Body or Lower Soul?" (*PAPA,* 75, xxvii) holds that by "lower soul" Plato means a mean proportional between the "higher soul" and the body. In *Soul and Sieve* (Univ. of Cal. Publications in Class. Phil.), I. M. Linforth studies Plato's views on the nature of the soul in relation to Orphic mysticism, eschatology, and the myth of the Danaids. The problem of eastern origins is treated in Coomaraswamy's article, "Recollection, Indian and Platonic" (Supp. to *Jour. of Amer. Oriental Soc.,* No. 3, 1944). F. Steckerl in "Plato, Hippocrates and the Menon Papyrus" (*CP,* 40, 166), by a comparison of Plato's *Phaedrus* (270c ff.) and the treatise *On Ancient Medicine,* shows that the latter is by Hippocrates. J. D. Wild in *Plato's Theory of Man* (Harvard Univ. Press, 1945) stresses the relevance of Plato's philosophy to modern issues. J. A. Notopoulos continues his study of the influence of Plato on Shelley (*cf.* THE AMERICAN YEAR BOOK, 1943, 894, and 1944, 920) in "A Shelleyan Symbol" (*CJ,* 40, 170) discussing Shelley's use of the serpent as a symbol of eternity. The same author in "Aristophron, or Platonism and the Poetic Mind" (*CJ,* 40, 129) continues his former studies in the same field (*cf.* THE AMERICAN YEAR BOOK, 1944, 920).

F. W. Householder, Jr., in "The First Chapter of the Poetics" (*AJP,* 66, 266), takes issue with an article by Pitcher on the same chapter in the same journal (65, 340). In an article, "Definitive Note on the Enthymeme" (*AJP,* 66, 303), S. Simonson sums up: "The Aristotelian idea of the enthymeme, therefore, retains consistency with its four main classes of probabilities, infallible and fallible signs, and example." In "Aristotle's Good and Just Heroes" (*Philological Quarterly,* 24, 1), S. M. Pitcher gives a new interpretation of Aristotle's Poetics. Philip Merlan, in "The Successor of Speusippus" (*PAPA,* 75, xxvl), shows that, at the death of Speusippus, the members of the Academy thought of electing Aristotle as their head, indicating that at that time they saw nothing in his views incompatible with those of the Academy. N. W. DeWitt has a good article entitled "Epicurus and Leucippus" (*CW,* 38, 19), dealing with the attitudes of recent critics toward Epicurus.

HISTORY AND CIVILIZATION

In this field a rather wide variety of subjects was treated during the year. S. Smith, in "Middle Minoan I-II and Babylonian Chronology" (*AJA,* 49, 1), states that "Babylonian chronology can not be fixed without consideration of evidence from Crete." J. P. Harland, in "The Date of the Hellenic Alphabet" (*SPUNC,* 42, 413), states that "the Hellenes *in the eastern Mediterranean area* had begun to adopt the Phoenician letters and to devise the first true alphabet with vowels and consonants as early as *ca.* 900 B. C. if not in the latter part of the tenth century."

An important contribution to Greek legal history is G. E. Calhoun's *Introduction to Greek Legal Science* (ed. F. Zulueta, Oxford, Clarendon Press, 1944), which traces Greek legal thought through five periods from Homer to the Hellenistic Age. "Administration of Justice in Boeotia," by R. J. Bonner and G. Smith (*CP,* 40, 11), treats the subject from the earliest times to the first century B. C. C. A. Forbes, in "Expanded uses of the Greek Gymnasium" (*CP,* 40, 32), shows that Greek gymnasiums, though originally intended for sports and exercise, were later used for lectures, schools, libraries, military training, concentration camps, public feasts, courts, public meetings, religious festivals, burial places, and even massacres. W. L. Westermann, in "Slave Maintenance and Slave Revolts" (*CP,* 40, 1), discusses standards of slave maintenance and the first Sicilian slave revolt in 135-132 B. C. He also shows from inscriptions from Delphi that slaves were freed by sale to the god.

C. A. Robinson, Jr., in an interesting article, "Athenian Politics 510-486 B. C." (*AJP,* 66, 243), shows that the supporters of Peisistratus also supported Cleisthenes, as both were leftist politicians. He also shows that the Athenian government was lenient to tyrannists until Marathon. K. von Fritz (*ibid.* 196) has an interesting note: "Gerousia—Gerochia." J. G. Milne has an article, "The Economic Policy of Solon" (*Hes.* 14, 230), dealing chiefly with currency reform. Hermann Fraenkel in "The Immigrant's Bath" (*UCPCP,* 12, 293) notes the ceremonial bath that was a part of an immigrant's taking up residence in a new locality.

H. J. Wolff has an article on "Marriage Law and Family Organization in Ancient Athens" (*Trad.* 2, 43). The matter of the tribute lists is again discussed by H. T. Wade-Gery in "The Question of Tribute in 449/8 B. C." (*Hes.* 14, 212). In "Pericles and His Colleagues" (*AJP,* 66, 113) V., Ehrenberg discusses the method of selection of the Athenian strategoi, with sidelights on the democracy of Athens in the Fifth Century. R. Schlatter in his "Thomas Hobbes and Thucydides" (*Journal of the History of Ideas,* 6, 350) attributes many of Hobbes' fundamental political ideas to the fact that as a young man he translated Thucydides. J. A. O. Larsen's (*CP,* 40, 65) "Representation and Democracy in Hellenistic Federalism" discusses Hellenistic federal institutions, particularly of the second century. G. C. Richards has a good article, "Polybius of Megalopolis, the Greek Admirer of Rome," (*CJ,* 40, 274).

E. J. Bickerman in "An Oath of Hannibal" (*TAPA,* 75, 87) maintains that Polybius (7, 9) in his quotation of Hannibal's oath confirming his alliance with Philip V of Macedon, is using an official translation from Punic into Greek prepared by Hannibal's chancellery. The same author in "Bellum Philippicum" (*CP,* 40, 137) studies the causes of the Second Macedonian War as given by ancient historians, in order to throw light on Roman imperialism and Greco-Roman historiography.

C. Roebuck's "A Note on Messenian Economy and Population" (*CP,* 40, 149) is an important contribution, dealing chiefly with the Hellenistic period. F. Solmsen in "Comanus 'Of the First Friends'" (*CP,* 40, 115) supports Hubbell (*CP,* 1933) in believing that Comanus, the statesman under Ptolemy Philometor, and Comanus, the philologist contemporary with Aristarchus, were the same person, basing his conclusions on a papyrus in the Columbia University collection published by Westermann in 1938. "Note on the Alexandrian Calendar" (*AJP,* 66, 189) by D. Macnaughton deals with the relationship between the Alexandrian and Egyptian calendars. A significant contribution to the history of ancient law is R. Taubenschlag's *The Law of Greco-Roman Egypt in the Light of the Papyri 332 B. C.—640 A. D.* (N. Y. Herald Square Press, 1944). Another important work on this period is *"Currency in Roman and Byzantine Egypt* (Princeton Univ. Pr. 1944) by L. C. West and A. C. Johnson.

RELIGION

The dividing line between religion and philosophy is difficult to draw. In this section will be included material on religion from the historical, mythological, and artistic point of view. Religion, considered from the speculative angle, is included in the section on Philosophy. G. E. Mylonas (*CW* 38, 180) shows the importance of the Homeric Hymn to Demeter as a source for an understanding of Demeter worship and of the Eleusinian Mysteries in his article "Hymn to Demeter." In "The Thracian Pig Dance" (*CP,* 40, 98), L. L. Lawler and A. E. Kober discuss the nature of the Thracian "kolabrismos." They conclude that it must have been a fertility rite of a spirited and probably orgiastic nature. Another paper by L. L. Lawler, "The Dance of the Ancient Mariners," appears in *TAPA* (75, 20). It deals with the dances performed in Delos by sailors whose course lay near the island. They were of remote antiquity and of several varieties, several being of Minoan origin and showing evidences of fertility ritual and the ritual of the "Sacred tree."

R. G. Hoerber, in "Divine Communication in Thucydides" (*PAPA,* 75, xxv), notes two types of this phenomenon in the historian, one religious in the form of oracles and frontier sacrifices and the other superstitious: earthquakes, eclipses, etc. J. Fontenrose presents a study in comparative mythology in *Philemon Lot, and Lycaon* (U. of Cal. Pubs. in Cl. Phil. Vol. 13. No. 4). An interesting article is M. P. Nilsson's "Pagan Divine Service in Late Antiquity" (*HTR,* 38, 63). N. points out the similarity between ancient pagan ritual (*e. g.* at Epidaurus) and Christian ritual. Animal sacrifices began to die out in the Hellenistic age largely on account of expense, and daily offerings of a less pretentious nature were substituted. Incense and the burning of lamps were popular with the Greeks and were adopted by the Christians. Hymns were chanted and choruses were established in pagan ritual and adopted by the Christians. To the hymns were added speeches, hence the sermon. Many temples had daily services. The cult of Asclepius had different hymns at different hours, hence the "horae canonicae" of Christian liturgy.

ART AND ARCHAEOLOGY

This branch of Greek studies has probably suffered more than any other as a result of war conditions. There has appeared, however, *The Excavations at Dura-Europos Conducted by Yale University and the French Academy of Inscriptions and Letters. Preliminary Report of the Ninth Season of Work* (1935-36. Ed. by M. I. Rostovtzeff, A. R. Bellinger, F. E. Brown, C. B. Welles: Part I: *The Agora and*

Bazaar (Yale Univ. Pr. 1944, illustrated). The prehistoric period still receives deserved attention in V. Mueller's "Development of the 'Megaron' in Prehistoric Greece" (*AJA,* 48, 342) and in C. W. Blegen's "The Roof of the Mycenenaean Megaron" (*AJA,* 49, 35). H. E. Searls and W. B. Dinsmore in "The Date of the Olympia Heraeum" (*Ibid.* 62) place that temple in the sixth century. In "Notes on the Interior of the Hephaisteion" (*Hes.* 14, 246), O. Broneer discusses two problems in connection with that temple: I. "The Interior Colonnade" and II. "Treatment of Wall Surfaces."

G. M. A. Richter continues her important work in this field with *"Archaic Attic Gravestones* (Harvard Univ. Press, 1944); *Greek Painting: The Development of Pictorial Representation from Archaic to Greco-Roman Times* (N. Y. Met. Mus. of Art, 1944); and an illustrated article on "Polychromy in Greek Sculpture with Special Reference to the Archaic Attic Gravestones in the Metropolitan Museum" (*AJA,* 48, 321). On this last subject see also L. F. Hull's article, "Notes on the Colors Preserved on the Archaic Gravestones in the Metropolitan Museum" (*ibid.* 334).

A chemical study of ancient pigments may be found in E. B. Caley's "Ancient Greek Pigments from the Agora" (*Hes.* 14, 152). C. A. Robinson, Jr. (*AJA,* 49, 121) identifies the statue of Zeus found off Cape Artemision in 1926 as the Zeus Ithomatas of Ageladas (*cf.* THE AMERICAN YEAR BOOK, 1944, 922). In *Early Hellenic Pottery of Crete* (Princeton Monographs in Art and Archaeology, xxiii, Princeton Univ. Press, 1945), D. Levi shows that there was a well defined geometrical school in Cretan pottery and that Crete, with Cyprus and Rhodes, formed a bridge to western Greece (*Early Hellenic Pottery of Crete,* Princeton Monographs in Art and Archaeology XXIII, Princeton University Press, 1945). H. R. W. Smith in *The Hearst Hydria* (Univ. of Calif. Pubs. in Classical Philology, Vol. 1, No. 10) deals with the style and date of this hydria and also with the data derived from archaeology as throwing light on the date of the Kypselids.

In "Graeco-Egyptian Masks and Portraits in the Royal Ontario Museum" (*AJA,* 49, 52), M. McCrimmon shows that Egyptian elements had disappeared from such work and that they had become entirely Graeco-Roman. O. Broneer in his paper, "The Tent of Xerxes and the Greek Theater" (Univ. of Calif. Pubs. in Class. Arch.), tries to show the influence of this tent on the Greek stage. In his dissertation, *Documents of Dying Paganism* (Univ. of Calif., 1945), P. Friedlaender deals with ancient textiles. E. T. Newell is the author of a monograh entitled *The Byzantine Hoard at Lagbe* (Numismatic Notes and Monographs, No. 105 of the American Numismatic Society, N. Y., 1945). A. R. Bellinger, in "King Antiochus in 151/0 B. C." (*Hesp.* 14, 58), disagrees with Heichelheim in his paper on a Hellenistic coin (*Hesp.* 13, 362) and thinks it was not minted at Antioch.

INSCRIPTIONS AND PAPYRI

As a humanistic introduction to this section should be mentioned the article by W. and C. Buckler entitled "The Bearing of Inscriptions on Classical Literature" (*CJ,* 40, 148). This deals with the light thrown by inscriptions on classical writers and on their works and includes both Greek and Latin literature. A. E. Raubitschek discusses *IG* 1 .20) on the relations between Athens and Halikyai and dates it 427/6 B. C. (*TAPA* 75, 10). V. B. Schuman in "Two Greek Ostraka" (*TAPA* 75, 68) describes two ostraka given him in Egypt in 1927-31. One, a description of a piece of land, he dates at the middle of the second half of the second century A. D. The second, a receipt for a payment of a beer tax, he dates 211 A. D.

B. D. Meritt continues his valuable work in the field of inscriptions in "Attic Inscriptions of the Fifth Century" (*Hes.* 14, 61) and "The Argives at Tanagra" (*ibid.* 134). Both are illustrated and indexed. Some are new fragments of inscriptions already published. See also (*ibid.* 147) E. Vanderpool, "Two Inscriptions near Athens," illustrated and indexed. For further work of Meritt see "Three Attic Inscriptions" (*AJP* 66, 234), in which he discusses the nature and dates of three inscriptions already published in *IG*. F. Jacoby has an article (*Hes.* 14, 157) entitled "Some Athenian Epigrams from the Persian Wars," a discussion of a fragment of stone discovered by American excavators in 1932, published by J. H. Oliver (*Hes.* 2, 480) and considered to be an addition to an inscription published by Rangabé in 1855 in Antiquités Helléniques (2, 597). Jacoby believes that this inscription is about Marathon, that it is not an epitaph but was on a war memorial and that it was not by Aeschylus or Simonides.

The University of Michigan continued its important work with *Papyri and Ostraca from Karanis* by H. C. Youtie and O. M. Pearl (vol. 6 of *Michigan Papyri* and vol. 47 of *Michigan Humanistic Series*). Progress in the fields of epigraphy and papyrology has been of relatively small amount, owing to wartime conditions.

HUMANITIES

The vast flood of writing on educational theory and practice deals to a large extent, either explicitly or implicitly, with the problem of the Humanities. There is the perennial problem of the "Quarrel of the Ancients and the Moderns." It is safe to predict that, with the atomic age upon us, there will be no decrease in talk about the Humanities. A few articles under this heading deserve mention here. In "An Analytic Definition of Liberal Education" (*CJ,* 41, 12), N. B. Johnson gives his views on the place of the Classics in a liberal education. Similarly, W. R. Agard, in "Classicism as a Contemporary Guide" (*CJ,* 40, 387) pays tribute to the value of the Classics and to Sir Gilbert Murray as an eminent representative of classical studies. B. L. Ullman has an interesting article entitled "Trends in Greek and Latin Studies" (*SPUNC,* 42, 403), in which he traces the history of classical scholarship from the time of the founding of the University of North Carolina in 1795 down to the present time. Basing his conclusions on the increased number of publications in the field of the Classics during the last 70 years, he indulges in what may seem to some an unwarranted optimism as to the future of classical studies. C. T. Murphy writes on "The Job of Classical Education in Colleges" (*CW,* 39, 10).

MISCELLANEOUS

The number of dissertations in the field of Greek scholarship naturally shows a considerable decline, as such work comes mostly from the age group engaged in war service. The *Classical Weekly's* (March 19, 1945) list of titles in the whole field of classical scholarship shows only 17 items, including six in the field of New Testament studies. E. S. McCartney (*CJ,* 40, 358) has an article entitled "Picturesque Ways of Estimating and Suggesting the Size of Huge Armies," with references to Homer, Aeschylus, Herodotus, and Latin and modern authors. A. Feldman contributes "Thoughts on Thales" (*CJ,* 41, 4). H. N. Couch in *Beauty and Parting* (Brown University Bookstore, 1945) presents translations from the Greek poets.

SEMITIC LANGUAGES AND LITERATURES

By Arthur Jeffery
Professor, Columbia University

ARCHAEOLOGY

Some material of strictly archaeological nature that has, nevertheless, a distinct bearing on important problems confronting Semitic scholars, should be recorded here. The papers on the significance of the Temple in the Ancient Near East, which began in the *Biblical Archaeologist* VII in 1944 with discussions by Harold H. Nelson on the Egyptian Temple and by A. Leo Oppenheim on the Mesopotamian temple, were continued in 1945 in papers by G. Ernest Wright on the Temple in Palestine and Syria, and by F. V. Filson on the Temple, the Synagogue, and the Church. Angelo Segre's "A Documentary Analysis of Ancient Palestinian Units of Measure," in the *JBL* for September (pp. 357-375), discusses Measures of Capacity; Jewish Measures of Weight; Syrian and Palestinian Measures of Length; Syrian and Palestinian Measures of Land; and the relation between the Jewish cubit, the Royal Egyptian cubit; and the Measures of Capacity in Egypt and Palestine. In *BASOR* No. 96 A. J. Sachs discusses certain related matters in his paper "Some Metrological Problems in Old Babylonian Mathematical Texts." Of even greater importance is the long discussion of O. Neugebauer in *JNES* for January (pp. 1-38) on the "History of Ancient Astronomy: Problems and Methods," for while it includes Greek and even Hindu astronomy, it is primarily a study of the Egyptian and Babylonian material, and makes clear from this material that astronomy did not, as so often asserted, grow out of astrology, but really sprang from problems of the Calendar. Another study which, though not in the Semitic field, is of considerable interest to Semitic studies is that by Hildegard Lewy on "The Genesis of the Faulty Persian Chronology," in *JAOS* for December 1944 (pp. 197-214).

SEMITIC PHILOLOGY

Several studies are perhaps classified better under this heading than under the individual languages. T. J. Meek's Presidential Address at the December 1944 meeting of the Society of Biblical Literature, on "The Syntax of the Sentence in Hebrew," was printed in the *JBL* for March (pp. 1-13), and is at pains to stress the importance of paying attention to sentence construction, *i.e.* to syntax, as well as to grammar and lexicon. In the *JAOS* for June Frank R. Blake continues his "Studies in Semitic Grammar," this being Study III, and discussing the problems of (i) *e* for *a* adjacent to a guttural in Akkadian; (ii) the supposed influence of preceding and following *i* in Akkadian. F. W. Geer's short study of "The Treatment of the Emphatics in Akkadian," in *JNES* for April, is in the interests of showing that the well-known unwillingness of Akkadian to keep two emphatic consonants in a tri-consonantal root is really a regular phenomenon so that a rule may be stated that in a root where in other Semitic languages there will be two emphatic consonants Akkadian will regularly change one of them to the nearest non-emphatic sound. A. S. Yahuda's attack on the genuineness of the Mesha' inscription is rebutted by F. W. Albright on general and on specifically linguistic grounds, in *JQR,* XXXV (pp. 247-250). In the same journal (pp. 281-301), Wm. Chomsky has a paper on "How the Study of Hebrew Grammar Began and Developed," giving some account of the theories and controversies of the early grammarians of Hebrew from Saadya up to the time of the earliest Christian Hebraists of the Reformation period.

SUMERO-AKKADIAN

In *BASOR* No. 96, S. N. Kramer has an article "Dilmun, the Land of the Living" in which, by a fresh examination of the early texts which speak of Dilmun, he sees reason to locate this Sumarian Elysium or Abode of the Blessed, which is in some sort a precursor of the Paradise story, not in the neighborhood of Bahrain in Arabia, as formerly thought, but in southwest Iran. He continues the study of this matter in the first of the Supplementary Studies of the *BASOR*, entitled "Enki and Ninhursag, a Sumerian Paradise Myth." This gives text and translation with full commentary, and facsimiles of the tablets, and corrects in innumerable places earlier translations of this material. The study contains also an excursus on Sumerian Lexicography calling attention to the fact that recent studies have so advanced our knowledge of this tongue that the existing lexicons, even that of Deimel, are hopelessly out of date and can be used only with the greatest care. In *JAOS* for December 1944, A. Leo Oppenheim has rendered important service by publishing several pages of emendations to the texts in Harper's *Assyrian and Babylonian Letters,* so commonly used in teaching Akkadian, emendations which have been made possible by advances in our knowledge of the language used in Neo-Assyrian and Neo-Babylonian documents.

In *Old Assyrian Letters and Business Documents,* issued by the Yale University Press, Ferris J. Stephens has published 84 plates making available new material from the James B. Nies Collection at Yale. A combined study by A. Leo Oppenheim and Louis F. Hartman on "The Domestic Animals of Ancient Mesopotamia" in *JNES* for July (pp. 152-177), gives us the text of a broken tablet in the Metropolitan Museum, which proves to be the XIIIth tablet of a Sumero-Akkadian Lexical Series, and on the basis of Hartman's edition of the text, Oppenheim reconstructs the entire tablet, with commentary and word indices, from all the available material. The list is extremely useful, as it gives long series of words used in connection with such domestic animals as the sheep, goat, ox, and donkey. Dr. Oppenheim has also contributed to the *JQR* for October a series of "Assyriological Notes to the Old Testament." A new contribution to the growing mass of Nuzi studies is Pierre M. Purves' "Commentary on Nuzi Real Property in the Light of Recent Studies," in *JNES* for April, (pp. 68-86), which elucidates a number of points important for the understanding of economic transactions in the Nuzi period.

EGYPTIAN

G. Steindorff who collaborated with K. Seele in the volume *When Egypt Ruled the East,* has now collaborated with Hoyningen-Huene to produce a volume called *Egypt,* to which he contributes the text and his collaborator the photographs, resulting in a volume of quite peculiar interest to all concerned not only with Egypt but with the Ancient East in general. In *JNES* for July (pp. 178-212), there is a long discussion on "The Songs of the Harper," by Miriam Lichtheim, who takes up the representations of the Harper in the Old, Middle, and New Kingdom, collects and translates with commentary the various "Harper Songs," relates them to the XVIIIth Dynasty "Orchestra Songs," and concludes that, contrary to earlier theory, these "Harper Songs" do not conform to one type, but that there are at least four distinct literary strata in their development.

UGARITIC

Practically the whole May number of the *Biblical Archaeologist* is given over to a paper on "Ugaritic Studies and the Bible," by H. L. Ginsberg, which has a map and illustrations, and provides an unusually lucid introduction to the whole field of Ugaritic studies, as well as indicating the importance of this material for the interpretation of the Hebrew Scriptures. The same author discusses the "North Canaanite Myth of Anath and Aqhat," in *BASOR* Nos. 97, 98, offering a goodly number of fresh interpretations of difficult passages. In the

JBL for September (pp. 319-337), Cullen I. K. Story has studied certain Ugaritic parallels in his paper on "The Book of Proverbs and North West Semitic Literature."

BIBLICAL

Perhaps the outstanding event of the year for the Semitist in this field has been the publication of the *Westminster Historical Atlas of the Bible,* edited by E. G. Wright and F. V. Filson, where the excellence of the maps produced by a new technique and made in conformity with the latest results of excavation, is rivaled by the excellence of the explanatory text which accompanies them, and makes the volume indispensable to all students of the Semitic East. Another comprehensive work is M. S. and J. L. Miller's *Encyclopaedia of Bible Life,* which though not by scholars has sought to profit by the work of scholarship and is admirably illustrated. O. R. Sellars' "Israel's Belief in Immortality," in the *Biblical Archaeologist* for February, is a useful assembly of material, setting the Old Testament statements against the Egyptian, Mesopotamian, and Old Canaanite burial customs.

In *JBL* for September Steven T. Byington's "Hebrew Marginalia III," continues his investigations into words and meanings in the Hebrew Bible. In a solid book *The Ark, the Ephod, and the Tent of Meeting,* published as Vol. II of the Krolik Memorial Publications, Julian Morgenstern assembles material that he had been publishing in the *Hebrew Union College Annual,* in which he discusses in great detail the Semitic material which may throw some light on the origins of the Ark of the Covenant. The same writer's "Divine Triad in Biblical Mythology" in *JBL* for March (pp. 15-37), discusses the names El, Elyon, and Shaddai in their relation to North Semitic religion and mythology. Alexander Sperber's "Biblical Exegesis," which also appears in the March number of *JBL* (pp. 39-140) perhaps also belongs here, for it is a continuation of his polemic against the historical and comparative method in Biblical studies, and an assembling of more evidence in favor of his own purely descriptive method.

Notice should also be taken of Rolland Emerson Wolfe's book *Meet Amos and Hosea, the Prophets of Israel,* which attempts to present afresh the significance of the early Prophetic movement. Frank Zimmermann pursues his quest for Aramaic origins of Old Testament documents by seeking, in an article in *JQR* for July (pp. 17-45), on "The Aramaic Provenance of Qoheleth," to demonstrate that the book of Ecclesiastes is a translation from an Aramaic original.

ARABIC

In "The Response to Nature in Arabic Poetry" in *JNES* for July (pp. 137-151), G. E. von Grüenbaum breaks new ground in the study of the literary forms and motifs of Arabic poetry, and another breaking of new ground is the volume on the little known subject of *Arab Archery* (Princeton University Press), the collaboration of R. P. Elmer and N. A. Faris. In this illustrated volume, a late mediaeval Arabic MS entitled "A Book on the Excellence of the Bow and Arrow, and the Description thereof," is translated and interpreted, Dr. Elmer providing the technical knowledge of archery, and Dr. Faris, whose native language is Arabic, handling the Arabic text. It is a distinct contribution to both Arabic and to Mediaeval studies.

An unusual study is one by A. S. Halkin in the *Proceedings of the American Academy for Jewish Research* XIV (pp. 25-145), on "Classical and Arabic Material in Ibn Aknin's Hygiene of the Soul." Joseph B. Judah Ibn Aqnin was a XIIIth Cent. disciple of Maimonides, and this article extracts from his as yet unpublished *Tibb an-Nufus* the almost 300 aphorisms, which he edits, and translates, and points to their analogues in Muslim and classical literature. In the same *Proceedings* (pp. 221-251), Wolf Leslau published some "Texts on Yemenite Folklore," gathered from a Yemenite Jew from San'a now resident in New York, which are an interesting and important contribution to our knowledge of the Judaeo-Arabic of South Arabia. The same writer deals with yet another dialect of Judaeo-Arabic in an article in *JQR* for July (pp. 61-78) on "Hebrew Elements in the Judaeo-Arabic Dialect of Fez," which is a grammatical study based on the recent French volumes of texts in the dialect used by the Moroccan Jews in Fez.

In the *JAOS* for March, H. Henry Spoer publishes another section of the Poems of Nimr ibn 'Adwan, which he and Elias M. Haddad collected in the environs of Damascus. The present group contains poems XXI-XXX in transliteration and translation with explicative notes. The paper "Islam's Conception of Human Destiny," by Wm. Thomson in the *Moslem World* for October offers much stimulating discussion of certain terms important in the earliest texts from Islam. In the same journal for April, Ilse Lichtenstädter, in an article on "Arabic and Islamic Historiography," traces the development of this branch of Arabic studies from the ancient genealogical lore and poetical glorification of the events in tribal life found among the Bedouin before Islam, through the collections of traditions and biographies and the Annals of the early Caliphate, to the really scientific study of history in the work of Ibn Khaldun.

It is well known that the Arabs collected the genealogical trees of their horses as well as their men, and a peculiarly interesting contribution to the study of Arabian Hippology is Carl R. Raswan's "Vocabulary of Bedouin Words Concerning Horses," published in *JNES* for April (pp. 97-129). Nelson Glueck's account of the "Wadi Sirhan in North Arabia," in *BASOR* No. 96, though it is for the most part a topographical account of the lifeline between the northern and southern parts of the Nabataean kingdom, has considerable interest for the early history of that Arab kingdom. The philologist, as well as the historian of art, will profit from the discussion by M. Aga Oghlu in his "Brief Note on Islamic Terminology for Bronze and Brass" in *JAOS* for December 1944.

ABYSSINIAN

Three studies of Wolf Leslau in this little developed field of Semitic studies call for special mention. His book *Gafat Documents: Records of a South-Ethiopic Language,* published as No. XXVIII of the American Oriental Series, gives a grammatical sketch, text, and comparative vocabulary of this now practically extinct dialect. Two articles of his in the *JAOS,* "The Verb in Tigré" in the March number (pp. 1-26), and "Grammatical Sketches in Tigre," in the September number (pp. 164-203), since they both deal with the Mensa dialect, together provide us with a convenient grammar of this most important of the Tigré dialects. In the first volume of the new Journal *Word,* Leslau has a paper (pp. 59-82), discussing the important question of the "Cushitic Influences on the Semitic Languages of Ethiopia: a Problem of Substratum."

SLAVIC LANGUAGES AND LITERATURES

By Anthony J. Klancar
Editor and Writer

GENERAL

No doubt the next decade will see a period of intensified activity in the study of Slavic languages and literatures. New departments of Slavic studies are being organized in many colleges and universities with grants from such institutions as the Rockefeller Foundation. Although the emphasis now primarily is on Russian, many students of Slavic are finding less-crowded fields in Polish, Czechoslovak, and Yugoslav, while Bulgarian, which in the early days of

Slavic philology received so much study, deserves more attention than it is getting. On the whole, interest in all branches of Slavic research has increased.

The biggest event for Slavic studies in the United States was the decision of Prof. Samuel H. Cross and his colleagues to continue publishing the *London Slavonic and East European Review.* Professor Cross is one of America's best known Slavicists, and his editorship promises to bring the best talent in the field to the pages of his review. Another great event was the news that a Russian Institute would be organized at Columbia University, with Prof. Ernest J. Simmons, new head of the Department of Slavic Languages and Literatures at that university, as one of its leading directors.

Of general interest is Prof. Arthur P. Coleman's "The Teaching of Area and Language Courses in the Field of Slavic and East European Studies: A Directory of U. S. Collegiate Institutions" *(*ASEER,* 185-208). One hundred fifty institutions of collegiate level offer courses dealing with the East European area, 81 in Russian and 12 in Polish.

A milestone in the history of Slavic studies in America is W. Chapin Huntington's announcement of "The Russian Translation Project of the American Council of Learned Societies" (*RR,* 40-48). Huntington discusses the kinds of books that are being translated, sets forth the qualifications of competent translators, and tells how these are chosen. It is hoped that the scope of the project will be extended to include other Slavic languages.

BIBLIOGRAPHY

The best general bibliography of work done in Slavic by American scholars is the one published in the *PMLA* annual supplement (March). The most complete bibliography on Russian is Katherine and Nikander Strelsky's list in the *Russian Review.* (Spring issue). Others available in pamphlet form are N. N. Martianoff's *Books Available in English by Russians and on Russia Published in the United States,* and W. B. Walsh's *Readers' Guide to Russia.* For a list of 1944 work on Russia see Strelsky's "Books and Articles on Russia" (*RR,* 104-119). *The American Review on the Soviet Union* publishes, throughout the year, annotated lists of books and articles.

Specialized bibliographies of non-Russian Slavic literature are issued periodically in mimeographed form by the American Association of Teachers of Slavic and East European Languages. Two such compilations by Marion M. Coleman have already appeared: *Material Available in English on Polish Drama and Theatre* and the same for *Czech Drama and Theatre.* Joseph Grass's "Libraries in Old Poland" (*PR,* No. 2, 8-9-14) contains some interesting lists of ancient Polish books that date back to the 10th Century. Reviews of current books on Slavic may also be found in the *American Slavic and East European Review, Ukrainian Quarterly,* and *Books Abroad.*

SLAVIC—GENERAL

One of the last things that Prof. John D. Prince wrote was a little note, "Universal Language?" (*BA,* 29), in which he suggests Slovak as a *lingua franca* along with English, Spanish, or Italian. Old Church Slavonic and its influence on Czech Slovak nationalism have finally found authoritative exposition in Roman Jakobson's "Beginnings of National Self-Determination in Europe" (*RP,* 29-42). Professor Jakobson examines the literary work of S. S. Cyril and Methodius and finds "Church Slavonic culture a perpetual source of inspiration for Czechs and most Slavic peoples." In "Kollar's Vision of Slav Brotherhood" (*SM,* No. 8, 7-18, 40), George Waskovich discusses the ideas contained in Jan Kollar's famous poem *Slavy Dcera.*

---

* Abbreviations used for periodicals are: *ARSU—American Review on the Soviet Union; ASEER—American Slavic and East European Review; At—Atlantic Monthly; BA—Books Abroad; NM—New Masses; PR—Polish Review; RP—Review of Politics; RR—Russian Review; Sci-Mo—Scientific Monthly; SM—Slavonic Monthly;* and *UQ—Ukrainian Quarterly.*

RUSSIAN LANGUAGE STUDIES

The popularity of Russian study increases each year as witnessed by M. H. Swadesh's *Talking Russian before You Know It* (Holt), E. Podbresky's *Short Cuts to Russian* (Padell), F. E. Sommer's *How to Read Russian* (Perkins), and D. Gurvitch and A. Herenroth's *Russians Say It This Way* (Intl. Univ. Press). T. E. Norton's "Poputchiki" (*At,* 131-2) gives an amusing picture of the difficulties a "fellow-traveler" has on the road to learning Russian. The best manual for self-teaching and even as a classroom text is N. N. Sergievsky's *Modern Russian* (Ungar).

To fulfill a need for increasing and testing a student's competent reading of Russian, which Professor Cross in his "Teaching College Russian" (*SR,* Vol. 27, No. 60, p. 48) defines as "the ability to read at sight any classic author . . . or any standard historical text . . ." A whole series of bilingual texts and readers were published in 1945. Among the former are Gogol's *Greatcoat* and Turgenev's *Mumu* (Transatlantic Arts), translated by Zlata Shoenberg and Jesse and John Domb. Uniform with these is Tolstoy's *Two Tales,* translated by P. T. Currall. Heath also began publication of a series of texts, beginning with Lermontov's *Tamn',* while Pitman brought out Tolstoy's *Family Happiness.*

RUSSIAN READERS

Several excellent Russian readers have appeared recently. Nikander Strelsky's *Russian Reader* (Longmans) includes material on general cultural subjects, the literature of classics, and articles on regions of the U. S. S. R. Rashelle Fastenberg's *Everybody's Russian Reader* (Lang. Stud. Press) highlights Russian literature from Pushkin to Simonov, based on texts used in primary and secondary schools of the U. S. S. R. There is also an excellent foreword by Prof. A. P. Coleman of Columbia University. Slanted toward students with a year or more of Russian, G. Z. Patrick's *Intermediate Russian Reader* (Pitman) covers about the same ground as the above. Nineteenth Century writers are featured in S. Konovalov's *Russian Prose Reader* (Intl. Univ. Press). Those wanting a complete topical phrase-book of value to travelers to U. S. S. R. will both enjoy and profit from N. E. Stepanoff's *Handbook of Modern Russian Conversation* (Dover). In *Advanced Conversation* (Heath), C. E. Kany and A. S. Kaun present a second booklet in a series of three Russian conversation manuals, designed to provide material for ten-minute conversations during each class period.

SCIENTIFIC RUSSIAN

Interest in scientific Russian keeps pace with Atomic Bomb research. J. Chaitkin's "Challenge of Scientific Russian" (*Sci. Mo.,* 301-6) deals with methods of teaching the Russian alphabet and gives some rules for pronunciation, while J. G. Tolpin in his authoritative "Teaching of Scientific Russian" (*ASEER,* 158-64) enumerates the basic requirements for successful teaching of scientific Russian: rudiments of grammar, accumulation of minimum vocabulary, coverage of fields of special interest, and practice in translation. So far we have only A. E. Chernukin's *English-Russian Technical Dictionary* (2nd ed. Intl. Univ. Press) to aid the student in his technical studies.

RUSSIAN LITERATURE

A great deal is being said today about Russian and Soviet literature. Tamara Motyleva discussing "Russian and World Literature" (*NM,* Nos. 9-10, 23-26, 23-25) points to Turgenev's and Dostoyevsky's influence on German, French, English, and American authors, and finds that "the true source of the greatness of Russian literature, however, was not in the backwardness of Old Russians but in the efforts to overcome this backwardness." Vera Alexandrova tells us in "The War in Soviet Literature" (*Common Sense,* 33-34) that Soviet writing itself is rooted in the great literature of the past decade. On the other hand "the Russian writer has this philosophy (necessary to a realistic novel) in dialectical materialism. He believes that men are motivated by forces and he also believes that men can shape these forces," Howard Fast points this out in his "Realism and the Soviet Novel" (*NM,* No. 10, pp. 15-16, 25-26). In a reminiscent mood Dorothy Brewster compares notes in "Appreciation of Alexei Tolstoy" (*NM,* No. 11, pp. 23-25) of her experiences in besieged Leningrad with similar scenes described in *Darkness and Dawn* and *Peter the Great.* The German in Tsarist days was a positive type in Russian literature, respected for his achievements in philosophy and science, but today he is a "bandit," a cold-blooded murderer. That is the opinion of Julia Sazonova, expressed in her study, "The German in Russian Literature" (*ASEER,* 51-79).

Perennial favorite of biographers, the older Tolstoy is again the subject of a keen analysis in Tikhon Polner's *Tolstoy and his Wife* (Norton). *The diaries of Tchaikovsky* (Norton) translated by Wladimir Lakond cover the years 1873 to 1891, a period of the Russian composer's greatest achievements. Slavic literature is rich in biography of general interest, but this form still begs for translators.

RUSSIAN THEATRE AND PLAYS

From Alexander Bakshy's "Latest Trends in the Soviet Theatre" (*RR,* 80-88) we learn that there is a tendency away from such political themes as the Five-Year Plan, the kulaks, or the achievements of the Red Army, and a return to the old favorites, such as Chekhov, Gorki, Gogol, Shakespeare, Goldoni, and Vega. Bakshy has also translated *Seven Plays* by M. Gorki (Yale Univ. Press), who more than any other writer gives complete expression to the "Rus" soul. In another volume, *The Plays of Anton Chekhov* (Caxton House), there are, among others, new versions of *The Sea Gull, Uncle Vanya, Three Sisters,* and *The Cherry Orchard.* Also worth mentioning is A. A. Shakhovskoi's "The New Sterne," a one-act play translated by Jeannette Eyre (*ASEER,* 80-92).

Howard Fast in the article mentioned above cites Konstantin Simonov as a type of Soviet realist and goes on to analyze the author's *Days and Nights* (Simon & Schuster) in that light. Simonov's best-selling novel is a non-political story of the personal fears, valor and idiosyncrasies that made up the united fight of the Red Army against the Nazis. Quite different is Zalman Shneour's *Song of the Dnieper* (Roy Publishers). In Joseph Leftwich's excellent translations we have the red-blooded story of a Jewish community in a little Russian town of the early 1900's. Another treat to readers of Russian literature is *The Short Novels of Dostoevski* (Dial). Including an introduction by Thomas Mann, this Collection consists of Dostoevski's six shorter novels long out of print, the best and most famous being *Notes from Underground, The Gambler,* and *The Eternal Husband.* Two anthologies also deserve mention here: B. G. Guerney's *Treasury of Russian Literature* (Blakiston) and J. Cournos' *Treasury of Russian Life and Humor* (Longmans).

In folk literature, there is Norbert Guterman's translation of *Russian Fairy Tales* (Pantheon Books). This is the first comprehensive edition of Russian fairy and folk tales. Based on Afanasiev's famous collection, it contains 180 stories and is richly illustrated.

UKRAINIAN

A Ukrainian scholar, Prof. Nicholas D. Czubatyj, should know "The Meaning of 'Russia' and 'Ukraine'" (*UQ,* 351-64). His article is an impartial analysis of the historical, geographical, political, and etymological meaning of the two words. Stephen Shumeyko's "Ukrainian Literary Tradition" (*UQ,* 365-75) is a good, concise survey of Ukrainian literature from the folk song to present writers. "Taras Shevchenko" (*UQ* 105-116) is the greatest poet of the Ukraine according to Prof. C. A. Manning, author of a recent book on *Ukrainian Literature*. A poet second only to Shevchenko is "Ivan Franko" (*UQ* 251-261), a biographical sketch by Stephen Shumeyko.

POLISH

The Polish poet, Adam Mickiewicz, is a perennial topic of research among American Slavicists. In a "Tribute to Adam Mickiewicz" (*Bulletin of the Polish Institute of Arts and Sciences in America,* Vol. 2, Nos. 3-4, 460-488), five scholars have written studies of Mickiewicz. For American readers, the most interesting are Tadeusz Mitana's "Professor G. R. Noyes and his Translations of Mickiewicz" and Leopold Wellisz's "Reverberations of Mickiewicz's Genius in America," which deals largely with the Polish poet's influence on Margaret Fuller and her circle.

The author of *Quo Vadis* saw a dark future for Polish-American immigrants, we learn from Sister M. Nobilis' "Sienkiewicz and the Poles in America" (*Polish-American Studies,* Vol. 2, Nos. 1-2, pp. 34-37). Besides the material found in the Polish novelist's *Report on the Poles in the United States* (1878), the writer also uses materials available in the Polish Roman Catholic Union Archives and Museum in Chicago. An interesting note for students of Polish-American relations may be found in S. L. Centkiewicz's "Polonica in English at the Library of the Polish R. C. Union in Chicago" (*PR,* No. 33, pp. 11, 13).

Paderewski's first opera *Manru,* presented for the first time in New York, is the subject of Marion M. Coleman's article "From Volhynia to the Metropolitan" (*PR,* June 28, pp. 4-5, 13); it traces in detail the steps by which Kraszewski's *Chata za wsie* became Paderewski's opera. Mrs. Coleman has also written on another Polish poet, "Malczewski's Marja: A Hundred and Twenty Years After" (*ASEER,* 111-126). *Marja,* a ballad-tale of murder and betrayal in high places, has as its background the poet's own life.

Polish literature is replete with evidences of how Poles feel toward their warlike German "friends." Zygmunt Wolski gives some good examples of this feeling in his "Age-old Scorn for Germans Reflected in Polish Literature and Proverbs" (*PR,* No. 23, 10-11). Here are some samples: "Germans are good only when they sleep," and "He who serves a German is paid by the devil." Alexander Janta, in his story of escape from a Nazi slave-labor camp, *Bound with Two Chains* (Roy Publishers), understood these proverbs in all their grim horror.

For several years now Kulb Polski, a club of Polish students at Columbia University, has been translating and publishing, under the guidance of Prof. Arthur P. Coleman and Marion M. Coleman, a series of Polish literary masterpieces. Their present volume, *Wayside Willow* is devoted to poetry. Another book, *The Stranger,* a novel by Marie Kuncewiczowa, completes the year's list of Polish literature in English translation.

CZECH AND YUGOSLAV

When F. C. Weiskopf's *Hundred Towers* (Fischer) was published it created a sensation among all lovers of literature. An anthology of writing between two wars, it contains stories, poems, and philosophical and biographical essays by 24 Czechoslovak authors. Two novelettes by one of Czechoslovakia's younger writers, Egon Hostovsky, have been received with similar acclaim by American critics. *Seven Times the Leading Man* (Fischer) deals with a writer in prewar Prague who plays the chief role in the lives of seven intellectuals whose spiritual weaknesses cause them to "run away or betray or submit." His other story, *The Hideout* (Random House) is an engineer's journal letters to his wife, the chronicle of his flight and two years spent in dark Paris cellars. Critics have proclaimed this story "a veritable little masterpiece." Translation of all three works (most of the anthology) was done by Fern Long who does an excellent job. In the Yugoslav field appeared, Ruth Sawyer's *This Is the Christmas* (Horn Book), a beautifully illustrated Serbian folk tale.

INDO-EUROPEAN LINGUISTICS

By GEORGE S. LANE
PROFESSOR, UNIVERSITY OF NORTH CAROLINA

THE LINGUISTIC INSTITUTE

In spite of war conditions and dearth of male students, the Institute has maintained an unbroken tradition, in 1942 at the University of North Carolina, in 1943 and 1944 at the University of Wisconsin, and in 1945 at the University of Michigan. Plans are being made to hold it again at Ann Arbor in 1946. These universities and the American Council of Learned Societies, which has so generously contributed aid in the form of fellowships, are to be congratulated on their devotion to higher learning in the Humanities during the stress of war with its undue emphasis upon the more "practical" sciences.

The session last summer at Ann Arbor ran from July 2 to Aug. 24 under the directorship of Prof. Charles C. Fries. Visiting instructors were Franklin Edgerton (Yale) in Sanskrit; Robert Hall (Brown) in Romance Languages; Otto Springer (Pennsylvania) in German; George Trager in Slavic Languages; and Carl Voegelin (Indiana) in General Linguistics and American Indian languages. Considerable emphasis was again laid upon the "intensive method" of language instruction and upon the descriptive technique in the analysis of unrecorded languages.

THE INTENSIVE LANGUAGE PROGRAM

The Program (cf. THE AMERICAN YEAR BOOK for 1943, p. 900f., and 1944, p. 928f.) has, of course, been in process of liquidation. However, its methods have been the occasion for continued reverberations in some of the journals devoted to language and language teaching. A recent discussion is that by J. Whatmough, "On Speaking with Tongues" (*Cl. Week*. 38. 123ff.) and the response by E. H. Sturtevant, "A Request for Further Information" (*ibid*. 172f.).

THE DESCRIPTIVE METHOD

In recent years there has been increasing controversy among linguists concerning the methods of descriptive linguistics. Most of these discussions have been reported in THE AMERICAN YEAR BOOK without particular emphasis upon the fundamentals at issue. The activities of the Intensive Language Program (cf. above) have served to augment this controversy and have given the two opposing sides clearer outline. A brief report to the general public is now not out of place.

In America the descriptive technique as practiced by the student of unwritten languages was outlined by Leonard Bloomfield in his book *Language* in 1933. Since then, the formalistic approach advocated there has been accepted and loudly proclaimed by many of Bloomfield's students and adherents. Other scholars have been just as vehement in their condemnation of the purely formalistic approach to language analysis (cf. the answer of Leo Spitzer, *Lang*. 20. 245ff.) to Bloomfield's discussion "Secondary and Tertiary Responses to Language" (*Lang*. 20. 45ff.; already reported in THE AMERICAN YEAR BOOK for 1944, p. 929), and the articles by Whatmough and Sturtevant cited above.

These discussions represent the complete cleavage of opinion on the rejection or admission of the mentalistic approach to language analysis. The school of Bloomfield rejects mentalism entirely from linguistics as a science, admitting only of a mechanistic, or better, formalistic, approach to language analysis. The opposite approach is defended by both Whatmough and Spitzer. More moderate viewpoints, or perhaps "middle of the road" approaches are advocated by Hans Sperber in "Behaviorism in Linguistics" (*Monatshefte f. deut. Unterricht* 37. 176ff.) and by Hans Kurath in his review of Bloch and Trager, "Outline of Linguistic Analysis" (*AJPh.* 66. 206ff.). Contributions to the descriptive method by means of formalistic approach are those by Z. S. Harris, "Simultaneous Components in Phonology" (*Lang.* 20. 181ff.); B. L. Whorf, "Grammatical Categories" (*ibid.* 211 ff.); and L. Bloomfield, "On Describing Inflection" (*Monatshefte f. deut. Unterricht* 37. 8ff.). In an article entitled "Change of Emphasis in Linguistics with Particular Reference to Paul and Bloomfield" (*Studies in Philology* 42. 465ff.), G. S. Lane has attempted to follow briefly the rise of (formalistic) descriptive linguistics as a science in the past few decades. Descriptive linguistics as a science is still in its infancy and, no doubt, there will be much chaff to winnow from the grain in the next few years, but grain there will certainly be.

HITTITE AND TOCHARIAN

The sharp controversy over the validity of the Indo-Hittite Laryngeal Hypothesis (cf. THE AMERICAN YEAR BOOK for 1941, p. 908, and 1942, p. 902) continues in G. Bonfante's "Retort" (*Cl. Ph.* 40. 116ff.) to E. H. Sturtevant's answer to his review of the latter's *Indo-Hittite Laryngeals* (THE AMERICAN YEAR BOOK 1943, p. 902). Bonfante's and Gelb's attempt to determine "The Position of Hieroglyphic Hittite among the Indo-European Languages" (*JAOS* 64. 169-190), in which they try to show that we are dealing with a "satem" rather than a "centum" language, is subjected to severe criticism, both as regards interpretation of the data involved and methodology, in the articles by A. Goetze "Hittite and the Indo-European Languages" (*ibid.* 65. 51ff.) and by W. M. Austin "The Scientific Method and Historical Linguistics" (*ibid.* 65. 63f.). In the former study, Goetze declares himself now for Sturtevant's "Indo-Hittite Hypothesis." One of the latter scholar's many contributions in the interpretation of Indo-European phenomena in the light of Hittite evidence is again found in "Hittite Verbal Nouns in -tar and the Latin Gerund" (*Lang.* 20. 206ff.).

For Tocharian there are two contributions to report: O. Maenchen-Helfen "The Yüeh-Chih Problem Re-examined" (*JAOS* 65. 71ff.), which reviews the ethnological problems involved in the identification of the Tocharians, and G. S. Lane "The Tocharian Palatalizarion (I)" (*Lang.* 21. 18ff.) which attempts to establish definitely the facts of the so-called palatalization and the relationship between non-palatalized and palatalized consonants. New discoveries are meager in both articles.

INDIC AND IRANIAN

P. Tedesco continues his exhaustive lexical studies with two articles: "Sanskrit *munda-* 'Shaven'" (*JAOS* 65. 82ff.), and "The Supposed Rigvedic Present *marate*" (*Lang.* 20. 212ff.). C. A. Ferguson applies the descriptive methodology to a modern Indic dialect in "A Chart of the Bengali Verb" (*JAOS* 65. 54ff.). T. A. Sebeoc reviews an old problem for new significance in "Finno-Ugric and the Languages of India" (*JAOS* 65. 59ff.). Evidence is assembled for the contact of Finno-Ugric with both Indo-European and non-Indo-European languages of India. R. G. Kent continues his Iranian studies in "The Name of Hystapes" (*Lang.* 21. 55ff.). The Persian proper name *Vištaspa-* (Grk. *Hystapes*) is a compound of the participle of *vaes-* 'come in ready for action' and *aspa-* 'horse'.

GREEK AND LATIN

G. M. Bolling has culminated his long and fruitful Homeric studies in "The Athetized Lines of the Iliad" (special publications of the Linguistic Society, Baltimore, Linguistic Society of America, 1944). (Review by J. A. Scott, *Cl. Ph.* 38. 74f.) Two other studies in Homer by Bolling are "The Etymology of ἴχωρ" (*Lang.* 21. 49ff.) and "Movable Nu at the End of Homeric Verses" (*Cl. Ph.* 40. 181). D'Arcy W. Thompson under the title "The Greek for a Dormouse" (*Cl. Ph.* 40. 185ff.) produced a brief study of greater interest to the general reader than the name would imply. E. L. Bassett in "The Genitive Absolute in Latin" (*Cl. Ph.* 40. 108ff.) attempts to show that this rare construction is not a Grecism but is of native origin.

GERMANIC AND CELTIC

Two general Germanic contributions are those of E. H. Sehrt, "The Origin of the Germanic Weak Preterite" (*Lang.* 20. 238ff.), which reviews the theory of its origin from the second person singular of the IE root aorist; and R. A. Fowkes "Germanic Etymologies" (*JEGPh.* 44. 208f.) with comments on the derivatives of the bases *sem-* and *jeug-*.

In Gothic, A. M. Sturtevant has continued his gleanings with "Notes on the Text of the Gothic Bible" (*JEGPh.* 44. 62ff.), "Notes on Gothic Morphology" (*PMLA* 60. 1ff.), and "Gothic Syntactical Notes" (*MLN* 60. 104ff.). Fritz Mezger presents a brief study in word formation in "Gothic *gabaurjopus*" (*Lang.* 21. 97f.). For Norse, consult F. T. Wood "Two Eddic Words" (*Scand. Studies and Notes* 18. 269f.).

Several studies in various phases of English linguistics have appeared: R. S. Wells "Pitch Phonemes in English" (*Lang.* 21. 27ff.); Helge Kökeritz "The Reduction of Initial *kn* and *gn* in English" (*ibid.* p. 77ff.); R. J. Menner "Multiple Meaning and Change of Meaning in English" (*ibid.* p. 59ff.), and S. H. Kuhn "E and Æ in Farman's Mercian Glosses" (*PMLA* 60. 631ff.).

For Celtic, should be noted L. H. Gray "Mutation in Gaulish" (*Lang.* 20. 223ff.); R. A. Fowkes "Some Welsh Notes" (*ibid.* 21. 96f.); and Myles Dillon "Linguistic Borrowing and Historical Evidence" (*ibid.* p. 12ff.). Dillon's study reviews the matter of classification of linguistic borrowings as "intimate" and "cultural" (Bloomfield) in connection with O'Rahilly's assumption of a pre-Goidelic substratum of Brittonic in Ireland.

DIVISION XXVI

THE ARTS

PAINTING

By Florence S. Berryman
The American Federation of Arts

GENERAL

The year in which history's worst war ended placed Americans in the role of recovering and safeguarding incalculable treasures of European painting and other works of art, and restoring some of them to their rightful owners.

In the United States, the last of American museums' art was brought out of hiding. Exhibitions of combat art by various branches of the armed forces probably reached a peak. Suggestions were advanced for a war museum to be built in Washington, to house these thousands of documentary paintings and drawings.

Industry extended its patronage of contemporary art. Public collections' acquisitions by gift and purchase increased. Auction prices for paintings rose to new heights, in keeping with the inflationary trends in other fields, and in some respects were better justified.

RESCUE AND PROTECTION OF EUROPE'S ART

General Patton's Third Army uncovered a colossal treasure trove in Germany. Paintings by the greatest masters—Raphael, Durer, Rembrandt, and many others—were found hidden in a salt mine near the village of Merkers in the Thuringian forest. The cache comprised about 1,000 cases of paintings and sculptures, 150 rare tapestries, and 1,000 engravings. Other collections were found at Berchtesgaden.

After V-E Day, the world learned of the Nazis' efficient organization for the care and redistribution of Europe's plundered art heritage. A staff of 250 German workers was employed to catalogue and restore works of art hidden in the Neuschwanstein Castle, erected by mad King Ludwig of Bavaria in 1869. They totaled 21,000 works.

Art treasures from nearly every country in Europe, their value estimated at approximately $2,000,000,000, were found in southern Bavaria and Austria, in seven hide-outs—castle vaults, mountain tunnels, and salt mines. A large part of it had been taken to Germany by Alfred Rosenberg's Art Commission, destined for the Adolf Hitler Museum at Linz, or a Hermann Goering Museum. Many masterpieces had been taken from the Rothschild, Alphonse Kann, and Stern collections in Paris, but German families were also looted, among them the Wittelsbachs, royal family of Bavaria. More than 200 collections were represented in the hoard, including the Warsaw Library (illuminated manuscripts) and the Jeu de Paume Museum in Paris (many paintings). Lieut. James Rorimer of the Metropolitan Museum of Art, New York City, did outstanding work in connection with these fabulous art troves.

HERMANN GOERING COLLECTION

The United States' 101st Airborne Division took charge of the Hermann Goering art collection of paintings, sculpture, and tapestries of an estimated value of more than $100,000,000. Goering had assembled it during more than a decade, partly by purchase with the proceeds of confiscated iron and steel plants, and partly by gift. Too extensive to be shown in its entirety except in a museum, most of the collection was originally kept at Karin Hall, his large home near Berlin, named after his first wife; the remainder was stored in vaults in Berlin. In April 1945, when he thought the Russians would take the German capital, Goering shipped his collection to Berchtesgaden. All the paintings were stored in a salt mine, but the Americans (3rd Infantry Division) arrived before the sculpture was out of sight; much of it had been badly damaged by the hurried and unprotected journey.

The 101st Airborne, arriving on the heels of the 3rd Infantry, removed the collection within three days to Unterstein and placed it on view to the public until mid-July. After it was catalogued by American experts, it was shipped to Munich warehouses to await disposition by the Reparations Committee. Some of it will undoubtedly be turned over to the U. S. Government as war reparations, according to Lieut. Ernest H. Allen of the 101st Airborne, one of the cataloguers, who wrote in *The Art Digest.* Where original ownership can be determined, items will be returned.

Paintings composed the largest part of Goering's collection, and included every school from German and Italian primitives, to contemporary German. Goering's favorite period appeared to be the 15th and 16th centuries. Two full-length portraits by Bellini headed a fine group of most of Italy's best masters. The German collection, too, was outstanding, with 47 Cranachs, and approached the Munich museum collections in quality. Large Flemish and Dutch groups included every famous name of the period. There was a small French collection, but the English and Spanish schools were represented with one painting each.

The collection of approximately 200 sculptures was especially strong in 15th century south German statues. About 50 tapestries ranged from the 12th to the 17th centuries, in period.

BELGIAN TREASURE

The American Army, by order of General Eisenhower, delivered Van Eyck's "Adoration of the Lamb" to Belgium to be replaced in the Church of St. Bavon in Ghent, for which it was painted five centuries ago. At an official ceremony at the Palace in Brussels, in the autumn, the American Ambassador turned over to the Prince Regent, Belgium's greatest art treasure, and one of the world's greatest.

GERMAN ART IN THE UNITED STATES

More than 200 paintings by old masters, valued at $80,000,000, were sent from German art museums damaged during the war, to the National Gallery of Art, Washington, D. C., for safe-keeping. They will be returned when conditions permit.

EXHIBITIONS OF WAR ART

Paintings and drawings connected with the war were exhibited throughout the United States, in both group and one-man shows, too numerous to list. Outstanding were the Abbott Collections of Army and Navy Medical Art; these supplied exhibitions which opened simultaneously on May 3. The Army collection, 250 paintings, opened at the Corcoran Gallery of Art, Washington, D. C. as the first place on a tour of large cities. One hundred paintings of Navy Medical Art opened at the Art Alliance, Philadelphia. Abbott Laboratories began early in the war (see THE AMERICAN YEAR BOOK, 1944) to commission American artists to make documentary paintings; the artists shared the hardships of the fighting men they depicted.

Kerr Eby, one of Abbott Laboratories' outstanding artist correspondents, who accompanied the Marines to Tarawa and Bougainville, showed 30 large paintings and drawings at Associated American Artists, New York, in May. They had captured what

General Smith, commander of the Tarawa assault described as "the dramatic intensity and spirit of men at war."

"The War Against Japan," an exhibition of 100 paintings and drawings by 17 combat and correspondent artists, sponsored by the Treasury Department to give impetus to the sale of war bonds, opened at the National Gallery, Washington, D. C. during the summer, and went from there to the Metropolitan Museum of Art, New York, and subsequently to the Baltimore Museum of Art. It was notable for its esthetic quality, as well as being a vivid record.

A series of paintings of Paris after its liberation, by Floyd and Gladys Rockmore Davis, was shown at Time & Life Information Center, New York City, in August. The artists had been sent to Paris in the autumn of 1944, on commission from *Life Magazine,* which reproduced the works in its July 16 issue.

INDUSTRY'S PATRONAGE OF ART

The Encyclopaedia Britannica's Collection of Contemporary American Painting, begun in 1943 and announced in 1944, made its debut in an exhibition at the Art Institute of Chicago in April, 1945. Subsequently it was shown in New York, Boston, Washington, Dayton, and Pittsburgh on what will probably be a five-year tour of the United States. Constantly growing and changing, the collection totaled 135 paintings by autumn, and a number of canvases originally acquired had been exchanged for better examples by the same artists. Active patronage of living American art by so-long-established and important a business firm as Encyclopaedia Britannica, was acclaimed everywhere as a factor of outstanding importance. The paintings represent a cross-section of American art, beginning with "the Eight of 1908," purchases having been made as a result of the collective opinions of about 50 artists, museum directors, and art dealers, obtained by means of a questionnaire devised by E. H. Powell, Britannica president.

The Pepsi-Cola Company, in accordance with its announcement in 1944, held its second annual "Portrait of America" competition for oil and tempera paintings of present-day America and American life, offering 20 prizes, totaling $15,250. A dual jury, conservative and modern, selected 150 exhibits from 3,270 entrants. A third jury awarded the prizes: 1st, $2,500, to Paul Burlin for "Soda Jerker"; 2nd, $2,000, to Max Weber for "Colonial Table"; 3rd, $1,500, to Gregorio Prestopino for "Morning Conference"; 4th, $1,000, to Mark Tobey for "Sale"; 5th, $750, to Zoltan Sepeshy for "Fisherman's Morning." Fifteen awards of $500 each were also made; and 12 of the paintings will be reproduced on Pepsi-Cola's calendar for 1946. The second "Portrait of America" exhibition was installed in November, in Rockefeller Center's Mezzanine Gallery. Critical opinion generally found it "more pictorial, more 'academic,' . . . more homogeneous" than that of 1944.

International Business Machines' president, Thomas J. Watson, who has acquired hundreds of paintings, sculptures, prints, and other works by living artists in recent years, was responsible for the "Arts Fiesta of the Americas" exhibition which opened at Grand Central Galleries, New York, in April. More than 300 artists were represented, from Canada and Latin American republics as well as the United States. Other Watson collections in recent years have been exhibited in 176 cities in the United States and Latin America.

The Upjohn Company of Kalamazoo, Mich., manufacturers of pharmaceuticals, began a collection of contemporary American paintings, which received widespread critical acclaim because works were selected by searches through galleries, studios, and national exhibitions. Paintings were chosen to illustrate messages in an advertising campaign "to explain recent developments in the field of medicine," and were reproduced in color in many popular magazines during 1945. A book entitled *Your Doctor Speaks,* incorporating the first 10 paintings and messages, was published and mailed to every registered physician in the United States (more than 100,000). Magazine insertions are scheduled through 1946. Fourteen artists were represented up to Nov. 1, and the original paintings were exhibited in October at the Grand Rapids Gallery as the first place on a long circuit which will take the collection around the United States. As new paintings are purchased, they will be reproduced for future magazine appearance, and will then be shipped to wherever the traveling exhibition is at the time.

The Bulova School of Watchmaking, Woodside, L. I., which was opened during the summer to train disabled veterans for positions in this industry, installed a series of mural paintings by Gerald Foster, assisted by John Poehler, which illustrate five methods of telling time in past ages.

Metro-Goldwyn-Mayer had commissioned Ivan Le Lorraine Albright to paint "The Picture of Dorian Gray" for its motion picture of that name, which was released during the year. Although the total cost was not divulged, it was surmised to be the costliest picture ever painted in America. The artist and his twin brother Zsissly as collaborator, worked for a year with all expenses paid, and in addition, received a fee for the painting.

The Connecticut Mutual Life Insurance Company of Hartford commemorated its 100th anniversary by issuing a jubilee calendar of the American Scene as depicted by American artists who lived during the century. Since 1935, this company has issued annually a calendar carrying reproductions of works by contemporary American artists. The American Artists Group of New York was commissioned to prepare the anniversary calendar.

MUSEUM ACQUISITIONS BY GIFT, PURCHASE OR LOAN—FRICK COLLECTION

Permanent collections throughout the country were augmented during the year. The Frick Collection, New York City, returned to public view after three years, with its group of more than 70 masterpieces rehung with six new acquisitions, five of which were purchased from the Morgan collection. They are Rembrandt's portrait of Nicolaes Ruts, dated 1631; Goya's portrait of the Ninth Duke of Osuna; Reynolds' portrait of Gen. John Burgoyne, painted in 1776; "The Wool Winder" by Greuze; Constable's "White Horse, a Scene on the River Stour"; and "Still Life" by Chardin.

STUART-LINTON COLLECTION

The Washington County Museum of Fine Arts, Hagerstown, Maryland, placed on view in October, nine paintings from the famous Stuart-Linton Collection, lent for an indefinite period by the grandson of the original owner of the collection, Charles Alfred George Stuart-Linton, who received more than 40 paintings and sculptures from Prince Adolphus Frederick, First Duke of Cambridge, brother of George IV of Great Britain. The Hagerstown group has an outstanding Greuze, "Danae" which was a favorite possession of Joseph Bonaparte. Van Dyck and Rubens are among the masters represented.

OLD MASTERS AND 18th CENTURY

Works by Old Masters of various schools included two important paintings of the Italian Renaissance: "The Mystical Marriage of St. Catherine," by Veronese, given to the Detroit Institute of Art by Mr. and Mrs. Walter O. Briggs, and never before publicly shown, although in private American collections since 1872; and a Florentine Quattrocento Annunciation, dated about 1435, attributed to Bicci di Lorenzo, acquired by the Boston Museum of Fine Arts from a Czechoslovakian collection. Masterpieces of the Flemish Renaissance included a portrait of a young priest, attributed to Hugo van der Goes, acquired by the Museum of Art of the Rhode Island School of Design, one of only three Goes portraits in this country; and "Adoration of the Magi" by Joos van der Beke van Cleve, painted about 1525, given by Mr. and Mrs. Edgar Whitcomb to the Detroit Institute of Art. The "Adoration" is not only a fine work, but is the key to the identity of this long-lost artist, whose name became confused with that of his son. Five famous examples of 18th century English painting were acquired by the Albright Art Gallery, Buffalo, from the Morgan collection, through gifts of the Knox family to a fund established in 1915 by Seymour Knox, Sr. The painting by Hogarth, is the only example of his "moral" work in the United States. Lawrence's "Miss Rosamond Croker" was considered by his contemporaries one of his two greatest portraits. The other three are by Reynolds, Gainsborough, and Romney.

19TH CENTURY FRENCH ACQUISITIONS

French paintings of the 19th century included David's "La Citoyenne Crouzet," painted about 1795, purchased by the Cleveland Museum of Art; "Les Courses d'Auteuil" by Manet, acquired by the Cincinnati Art Museum; two by Renoir, the important "Young Shepherd" painted in his old age, acquired by the Museum of the Rhode Island School of Design, and his famous "Seated Nude," of his late period, acquired by the Art Institute of Chicago; and "Le Port de Gravelines" by Georges Seurat, given to the John Herron Art Institute, Indianapolis, probably the last important work by this scientist-artist which will come on the market.

AMERICAN PAINTINGS

American painting fared well during the year. In addition to the extensive purchases by business firms already noted, many works were acquired by museums and art galleries in accordance with regular programs. The Dallas (Texas) Museum joined this group by instituting a long-range program for enlarging its collection along four lines: regional, national, and international contemporary painting, and earlier work. From its exhibition of contemporary American painting held early in the year, the Museum purchased five paintings, and received a sixth by gift.

Iowa State University also inaugurated an annual exhibition of contemporary painting, in July, with the double purpose of offering its region a cross-section of progressive painting, and of developing a good teaching collection. The University purchased five paintings from 127 on view, and others were sold to private collectors.

The New Britain (Conn.) Institute's Art Museum, only four years old, has assembled a creditable collection of American paintings, to which 21 were added by purchase during 1944-45.

The University of Georgia received, as a gift from Alfred H. Holbrook, a collection of 100 paintings by as many American artists of the past century, as a memorial to his wife. The Eva Underwood Holbrook Memorial Collection will form the nucleus of a fine arts museum eventually to be established on the university campus.

EXHIBITION OF RHODE ISLAND SCHOOL OF DESIGN

Of many well-organized and excellent exhibitions held during the year, a large number benefited Government bond sales or charitable organizations. The Rhode Island School of Design Museum of Art opened in January an exhibition entitled "Old and New England" as an "Art for Bonds" show. It was critically acclaimed as the most ambitious exhibition undertaken anywhere in several years. Director Gordon Washburn worked seven months assembling 103 paintings from many private and museum collections. Among them were 38 canvases from Britain's "golden age," nine portraits by Gilbert Stuart, including that of George Washington from the State House in Providence, removed for the first time since 1801, and accompanied by an armed guard; 11 paintings by John Singleton Copley, and many other masters, which constituted an opportunity to compare the painting of England and New England between 1670 and 1835. At the opening ceremonies, Jan. 19, 1945, the Rhode Island War Finance Committee announced the show was responsible for the sale of $1,333,650 in war bonds, and a few days later, for another $250,000.

ART INSTITUTE OF CHICAGO

The Art Institute of Chicago assembled and documented a great exhibition of "The Hudson River School and the Early American Landscape Tradition," its largest undertaking since the Century of Progress Exhibitions there in 1933 and '34. The collection of 164 pictures, mostly oil paintings, representing 50 artists, was shown in March, went to the Whitney Museum, New York City, for April and May.

BOSTON

The Boston Museum of Fine Arts showed "1000 Years of Landscape: East and West" from its own collection augmented by loans. It included Chinese scroll paintings dating from the 10th century, Japanese, Indian, and Persian work from the 15th, and western paintings and prints from the 15th century through Postimpressionism.

NEW YORK

The Whitney Museum, New York City, and the Walker Art Center, Minneapolis, collaborated on an exhibition, "American Watercolor and Winslow Homer," which was shown in the spring in those cities and Detroit. It ranged from early 19th century lady amateurs through Homer and his great contemporaries, down to the present day.

The Centenary of the Naval Academy's founding at Annapolis was commemorated by exhibitions in two New York City galleries. The Knoedler Galleries held a comprehensive exhibition of paintings, many from the Academy's permanent collection, which celebrated the growth and exploits of the Navy from Revolutionary times through the Second World War. The Harry Shaw Newman Gallery had an exhibition of 15 historical Naval paintings, nine of which were sold in the first few days.

Other old master exhibitions included "Dutch Masters of the 17th Century," at the Knoedler Galleries, New York City, in February, comprising portraits, landscapes, marines, still life, and conversation pieces; and the Flint, Michigan Institute of Arts' "Victory" show in September and October, of 14 paintings of fine quality by old masters, loans from two New York firms, Duveen and Wildenstein.

The Museum of Modern Art for the first time in the 15 years of its life, displayed its permanent collection in part. From its more than 900 works, 300 paintings and 75 sculptures were installed on two floors. Comprising folk art and modern primitives, European masters, School of Paris, American Painting in the International Tradition and related categories, it was hailed as surprisingly good.

The National Association of Portrait Painters held its first exhibition in 20 years: "Portraits of Americans by Americans," at the New York Historical Society in April, comprising 97 paintings and sculpture from public and private collections. Proceeds from the sale of an illustrated catalogue went to the Welfare Fund of United States Naval Hospital at Sea Gate, New York Harbor.

Portraits, Inc. held at the end of the year, an exhibition of "Portraits of American Women," for the benefit of the Home for Incurables. It included work by many famous painters of women prominent during the century and a half from James Peale to Salvador Dali.

The Whitney Museum held in March and April an exhibition of paintings by noted European artists who have come to America since 1938, from 12 nations: Masson, Leger, Ernst, Chagall, Dali, Hayter, Helion, Tchelitchew, Duchamp, Tanguy, Kisling, Mondrian, Ozenfant and many others, talented refugees who have inevitably influenced contemporary American painting.

Arts and Antiques Show, held at the 17th Regiment Armory in New York the last week of September, had two large exhibitions of art: one comprising 10 paintings and two sculptures selected by each of 13 New York art critics; the other assembled by art dealers. Sponsored by Seymour Halpern Associates, the exposition occupied 40,000 square feet of floor space, attracted approximately 76,000 persons; purchases amounted to more than $1,500,000 worth of furniture and paintings.

NEGRO ART

The Albany Institute of History and Art aided by the Carnegie Corporation of New York and the Phelps Stokes Fund, assembled "The Negro Artist Comes of Age," comprising 76 works by 43 contemporary American Negro painters and sculptors, the largest exhibition of the kind yet seen. After its close in February, The American Federation of Arts took it over for a national circuit.

ANNUAL AND BIENNIAL EXHIBITS

The Corcoran Gallery of Art held its 19th Biennial Exhibition of Contemporary American Oil Paintings in March, which, like the 1943 Biennial, was an invitation affair for the same reason — transportation difficulties. Reginald Marsh won the first prize of $2,000 and the Corcoran Gold Medal for "Strip Tease in New Jersey"; Zsissly, second prize of $1,500 and Corcoran Silver Medal for "Deer Isle, Maine"; Isabel Bishop, third prize of $1,000 and Corcoran Bronze Medal for "Two Girls Outdoors"; Jean Liberte, fourth prize of $500 and Honorable Mention certificate for "Twin Lights, Rockport."

The Pennsylvania Academy of Fine Arts 140th annual exhibition comprised 305 exhibits. It was modern in trend. Abraham Rattner's semi-abstract "Kiosk" received the Temple Medal and Stuart Davis' "Ultra Marine" fetched the J. Henry Scheidt Memorial prize. There were seven other regular awards for painting and sculpture as well as purchase funds.

The Cleveland Museum of Art held its 27th annual "May Show" devoted to work of local artists, for support of whom the city is famous. Figures for the earlier annual show also totaled 7,727 objects sold for the sum of $229,064.05. The 1945 annual comprised 1,097 items by 324 Cleveland artists and craftsmen; 74 prizes and honorable mentions were awarded in 20 different categories.

The Audubon Artists Group of New York, a fast-growing organization established in 1940 on the site of the J. J. Audubon homestead, Washington Heights, held its fourth annual at the National Academy in September. Nearly 600 exhibits in four different media ranged from ultra-conservative to radical. Prizes totaling $2,500 were awarded, as well as several gold medals of honor.

Carnegie Institute, Pittsburgh, held its Founders Day exhibition Oct. 11 to Dec. 9. John O'Connor, Jr., acting director, invited the 350 works comprising "Painting in the United States 1945," which was considered excellent in representing all trends in American painting today. Philip Guston won the Carnegie first prize of $1,000.

The Art Institute of Chicago's 56th annual of American Paintings opened in October, was markedly naturalistic in character, and also had a surprisingly large number of religious paintings.

ONE-MAN SHOWS

Wassily Kandinsky, abstract and non-objective painter, who died in Paris December 1944, was commemorated by The Museum of Non-Objective Art, New York, which has the largest collection of his works in America, with a spring exhibition of 227 paintings, including loans.

Georges Rouault had a large, impressive exhibition of paintings, lithographs, and etchings at the Museum of Modern Art, New York, April through June.

Claude Monet was commemorated in a loan exhibition of 80 of his paintings at the Wildenstein Galleries, New York, the largest display of his work ever held in the United States. Proceeds from an admission fee went for the benefit of children of Giverny, where Monet lived and worked for many years. Exhibitions of work by other Impressionists were held at the same time (April and May), in other dealers' galleries: oil paintings by Renoir and pastels by Degas at Durand-Ruel; outstanding examples by six Impressionists — Manet, Monet, Renoir, Degas, Pissarro and Sisley — at Carroll Carstairs, enabling visitors to review the whole movement at these galleries.

Pissarro was seen in a loan exhibition of 50 paintings at Wildenstein Galleries in October, for the benefit of Goddard Neighborhood Center. It was supplemented with works by other Impressionists and earlier painters who had influenced Pissarro.

Daumier.—"Daumier, Illustrator and Caricaturist" was one of the nation's outstanding shows in November. Held at the Providence, R. I. Museum, it comprised oil paintings and the most complete collection ever assembled in the United States of books illustrated by Daumier, a set of *La Caricatura* containing his political cartoons, and lithographs from Le Charivari.

Ralph Earl, 18th century American portraitist, was shown in a full-length exhibition by collaboration of the Whitney Museum of American Art, New York, and the Worcester, Mass. Museum, which showed 47 fine character portrayals of New England people of the Revolutionary and early Republic periods, and two landscapes. Worcester was Earl's birthplace.

Ernest Lawson, pioneer American Impressionist, was commemorated in an exhibition at Ferargil Galleries, New York, in March, held with the cooperation of Macbeth, Milch, Babcock, and Kraushaar Galleries, which covered his career from 1890 to 1940.

The Albrights, Ivan Le Lorraine and Malvin Marr (Zsissly), identical twins, were given an enormous double retrospective exhibition of paintings in New York City at Associated American Artists in October. They have always worked together, but do not paint alike.

Stuart Davis, eminent abstractionist, was given a one-man retrospective of 30 years at the Museum of Modern Art, New York, at the end of the year, lasting into 1946. He is termed a "painter in tune with his times."

MISCELLANY

Great Britain, despite the war, bought generously of paintings and other works in the American-British Goodwill Exhibition on tour in the British Isles, under the auspices of Artists for Victory: two paintings for the Tate Gallery, London; other paintings for the National Gallery of Scotland, the Glasgow Corporation, and City Library of Dundee; five paintings and sculpture were private purchases; 60 prints were purchased, 20 to be presented to Glasgow University.

Television scored in a successful transmission of paintings in full color from Columbia Broadcasting System's studios, with a color system developed by Dr. Peter C. Goldmark, director of engineering research. The telecast was described in *The New York Times* as having "superb clarity and beautifully detailed color."

Kennebunkport, Maine citizens revived the dissensions of the '30s concerning government art projects. Led by Booth Tarkington and Kenneth Roberts, novelist, the people raised more than $1,000 for a mural painting to replace those in their post office done under the WPA art project. The protest was carried to the U. S. Senate *via* Maine's Senator White.

AUCTION SALES AND PRICES

An Art auction sale held June 13, at the New School for Social Research, New York City, for the benefit of the 7th War Bond Drive, raised nearly $1,000,000 in war bonds. This sum, one of the highest amounts ever raised for such a purpose in New York, was credited to 130 artists and 13 dealers, who contributed paintings, drawings, and prints valued at $100.000. The highest bid for a single work was $86,000 in bonds for a portrait to be done by Nikol Schattenstein. "Freedom" by Lily Harmon fetched $75,000. The auction was conducted by Dale Elman of Hobby Lobby and Auction of the Air.

Parke-Bernet Galleries, New York, reported that sales for 1944-45 broke not only its previous records, but those of its predecessor, the American Art Association-Anderson Galleries, with a total of $6,165,920. The increase was in buyers rather than prices. There were 104 sales, 15 of paintings alone, others of paintings and other items. The Vanderbilt collection of Barbizon and genre paintings was one of two highest totals reached—$323,195. Millet's "Water Carrier" fetched $30,000, and Millet's "Sower" followed for $26,000. Incidentally, the "Sower" after 60 years in the Vanderbilt collection, went to the Provident Trust Company of Philadelphia, which has long used it as a trademark. Hals' "Laughing Child" went for $15,500; his "Laughing Boy" for $15,000; Van Dyck's "Constantin Huygens," $13,000; Millet's "Knitting Lesson," $12,500; Rembrandt's "Portrait of His Father," $11,500; Boldini's "Ladies of the First Empire," $11,000; Millet's "Shepherdess, Plains of Barbizon," $11,000; Renoir's "Femme Assise," $9,000.

The Kende Galleries, New York, confirmed Parke-Bernet's notice of increased public interest in genre works. Kende sales realized a total of $3,635,275 and included two famous art collections, those of Frank G. Logan and Jules Bache. Frederic Remington's "Dash for Timber" fetched $23,000, an unprecedented price for such a painting by that artist. Kende Galleries received the highest price for the entire season, for a single painting auctioned in New York, $41,000 for "The Baptism of Clorinda," by Tintoretto, from the Logan collection, sold in February. On the first night, 40 paintings sold for $87,495, including the Tintoretto. The entire Logan collection realized $131,020.

The new season began with the sensational sale of the Willys collection at Parke-Bernet on Oct. 25: the most important group to appear at public auction since 1928. Rembrandt's "Pilgrim at Prayer" fetched $75,000 from Billy Rose; Frans Hals' "Joseph Coymans," $34,250; Velasquez's "Portrait of a Girl," $30,000; Hobbema's "View of Watermill," $30,000, also "Laughing Child with a Dog," $14,000; Hans Memling's "Portrait of a Youth," $21,500. Sales totaled $313,950 for 36 items.

SCULPTURE

By Rose V. S. Berry
Art Critic and Writer

GENERAL

In discussing the peace that must follow the war, there is an insistent demand that there be an understanding of the cultural arts of all peoples. This does not mean an understanding of the amazingly distributed Parisian product of today. It is rather a knowledge of native art wherever it exists. It means a return to original sources—the art better known to ethnologists and archaeologists. It is a modern and comprehensive approach to that art, which Elie Faure says "expresses life, and is therefore as mysterious as life itself."

This demand is especially gratifying since it places art above the level assigned to it by modern psychology, which meets with the approval of some artists, as a product of "Man's Playtime." In the face of existing facts it is difficult to justify this attitude toward art. Since time immemorial the artist, as a gifted person, has been a man apart, envied by men of lesser endowment. In each instance the artist was highly regarded. His work was often associated with miracles, religion, even given the dignity of actual worship. With these truths in mind it is difficult to accept a "playtime" element even as a casual creative source. One can scarcely imagine Phidias, Praxitiles, or Scopas, as having given themselves over to "play" while cutting their masterpieces from a marble matrix.

On the other hand, no one will deny that the *spirit* of fun and "play" has been portrayed in the art of the ages, but it was portrayed by the master who had conquered his medium; and had made of himself the discerning critic capable of stopping within the hair's breadth that would make a smirk of a smile or a guffawing gesture of a sensitive pose. Extremes are to be met with, however, in the output of sculpture in 1945.

SCULPTURE UNDER WAR CONDITIONS

History repeats itself in that no one of the arts suffers such hardship as sculpture in troublesome times. An instance is manifest in the exhibitions of the opening of 1945's art season. Out of 143 exhibitions, ten carried sculpture, and three of the ten were one-man shows. Later in the season, out of 70 exhibitions throughout the states, and 73 in New York City alone, three of them carried the work of sculptors. Nevertheless, there have been some exceedingly interesting exhibitions, and some work of unusual originality, with the additional advantage of taking the observer into widespread localities.

NATIONAL ACADEMY EXHIBITION

Notable sculpture in the 119th Annual included work by Max Kalish, Joe Brown, Ruth Brassler, Cornelia Van A. Chapin, Beonne Boronda, Gaetano Cecere, Pietro Montana, and Henry Rox. In its annual election, the National Academy named Paul Manship as its second vice-president. The following sculptors were elected to associate membership: Cornelia Van A. Chapin, Frances Grimes, and Albert Stewart.

PENNSYLVANIA ACADEMY OF FINE ARTS

The Pennsylvania Academy of Fine Arts awarded its sculpture prizes as follows: Widener Memorial Medal to José de Creeft for his heroic portrait of Rachmaninoff; Honorable Mention to Oronzio Malderelli, for his Mare and Foal. Among other outstanding examples were Zadkine's France Imprisoned, Hugo Robus' Girl with Pretty Face, Ben Shmuel's Job, Chaim Gross' semi-abstract wood carving of a Bird's Nest, Jean de Marco's Saint Francis, William Zorach's Lament; Harry Rosin's Garden Figure; William Steig's Fool No. Two, and Carl Walter's Ceramic Dog.

WHITNEY GALLERIES

The re-opening of the Whitney Gallery, apart from the Metropolitan, was given to sculpture in two of its galleries. The critics felt it necessary to assert that the best work had been done by the "old guard." On the whole there was little or no new feeling or thought about the year's output. Mention was made of fewer than 20 examples, and four of these were cited as poor work by good men. Among those favored were: Henry Kries's Expectancy, done in Georgia marble; Zorach's Myra, a head done in marble; Herbert Ferber's Standing Figure, a caricature in black walnut; Chaim Gross' Twins, done in polished Sabacu wood; Noguchi's palm wood piece, like petrified driftwood formation; Maldarelli's Jemini; Kaz's Daniel and the Lion; José de Creeft's New Being. These were among the more interesting examples, while Paul Fiene's Torso American, hollow and made of Terracotta, was clever and neat modeling, as was Anita Weschler's Bust of Marilyn.

SCULPTURE AND ARCHITECTURE

A series of exhibitions of contemporary sculpture were given through the season in the Gallery of the Architectural League. The purpose was to exploit new trends in the association of the two arts. Among the sculptors exhibiting were Alexander Archipenko, Ernst Barlach, Alexander Calder, José de Creeft, Jean de Marco, Jacob Epstein, John B. Flannagan, Chaim Gross, Laston Lachaise, Jacques Lipchitz, Henry Moore, Hugo Robus, Ossip Zadkine, and William Zorach.

CHICAGO ARTISTS' ANNUAL

Prizes and awards were given to John David Brcin who received the grand prize for his portrait head of

Duvigne, and another prize went to Joseph Martinek's Martyr—Lynched Negro. Honorable Mention was awarded to Sylvia Judson for a sculptured head of John McCutcheon.

NEW YORK SOCIETY OF WOMEN ARTISTS

In 1945, women exhibited sculptures upon a high level, and among the examples receiving special mention were: Hunger, and a Head of Jeanne by Doris Caesar; two fine wood figures by Clara Shainess; Lady Godiva, a competent nude, by Hazel Jackson; Adolescence, a classic figure, and Frightened Evacues, by Berta Margoulies; Torso, carved in wood by Margaret Brassler Kane; A Mask: Aspect of Pain, by Mitzi Solomon; Fine Feathers, a whimsical study, by Frances M. Morgan; Lola, by Beatrice Stone; Ancestor, by Mary Kellner; Florence, by Arline Wingate. In addition there were several excellent portrait busts by Wingate, Stone, and Elizabeth Geiger. Beonne Boronda, Edith C. Barry, and Rhys Caparus exhibited animal subjects of merit.

WATSON COLLECTION TOUR

The Watson Collection Touring Hemisphere for Unity of Nations included American sculpture by Jo Davidson, Gutzon Borglum, Simon Moselsio, Charles Umlauf, and Hugo Robus.

ONE MAN SHOWS

At Bethlehem, Pa. were William M. Swallow's ceramic sculpture and Joseph Goethe's wood sculpture. At the Philadelphia Art Alliance was Mitzi Solomon's sculpture. Madelene Park and Florence Waterbury, gave joint sculpture exhibits at Elmira, N. Y. Patteran's ceramic sculpture was shown at Buffalo, N. Y., the Guild of Boston Sculpture (Collective) was shown in that city, and Gitow Knopp's sculpture at Houston, Tex.

In the New York City galleries, William Zorach's bronzes and marbles were shown at the Down Town Gallery; there was also Koren Der Harootian's big show, with a wide range of mediums, gains by study of silhouette in the round. The International Print Society exhibited Richmond Barthé's sculpture.

PRIZES, AWARDS, AND SCHOLARSHIPS

Guggenheim fellowships were granted to Adolph Dioda and Eleanor L. Platt for creative work in sculpture. A renewal of Donald A. Hord's fellowship was also granted. Robert Laurent received the Audubon Sculpture Award, for his alabaster Melisande. The Allied Artists of America gave mention to Peter Fingstin's Voice of Silence. The Annual New Jersey State Art Exhibition gave a cash award to Bruno Mankowski for his sculptured Fish.

PLACEMENTS

Wichita's (Kan.) Museum included William Zorach's Quest among its nine purchases. The Whitney Gallery purchased, for its permanent collection, The Twins, by Chaim Gross, and the Mine Disaster, by Berta Margoulies. Herbert Hazeltine's celebrated portraits of horses are coming to rest the whole world over. A recent bronze of heroic size, commissioned by an Indian Maharajah, has been placed in a large hunting park at his estate in India where it has a superb vista.

SCULPTURE TRENDS

The sculpture story for 1945 would not be complete if some of the definite trends and departures were not cited. In many ways, four years of war have driven art lovers into a search for new mediums and intriguing form. In some ventures the result has been entirely realistic; in others it has led straight into the vast and mystic realm of the abstract, with vagaries, that include the *nothingness* of nothing or the kind of inner reality that did not exist before in the confines of the art of sculpture. To some observers the accomplishment may seem trite; to others it will open new avenues of approach, beginning, it may be with a laugh, and ending with wonderment.

THE FOX FRUITS AND VEGETABLE SCULPTURE

Examples of the first would be found in the surprising photographs of fruit and vegetable sculpture, shown by Henry Fox of Concord, N. H. This evidence of an unexpected sculpturesque presence is hardly less amusing than the portraits that a search will reveal in the blossom-tip of the hickory nut, and these will be rivaled, for humor, in the possibility of an ill-shaped, rotund peanut that may supply a torso for it's comical head and face. Almost anyone with a little imagination will discover that these nuts require blots of ink for eyes, and some character lines only, to become clever gremlins and grotesques. If this may be regarded as sculpture, it differs in that the artist begins with a lump, core, or kernel already fashioned for his use. It ends with height, breadth, and thickness, the component essentials of the art in the round. They are comparable, in a humble way, with ill-shaped precious stones, pearls, and valuable metal nuggets that have inspired gold- and silversmiths since the days of the Renaissance. The fact that each is an entity, incapable of being reproduced, in its unique aspect adds to its attraction, the chief element of which is a recognizable naturalistic appearance.

THE HEBALD SCULPTURE

A second type of sculpture, entirely genuine as an art requiring modeling and the sculptor's skill, is that with which Milton Hebald has won special interest. He calls it Sculpture with Which to Play. The example, which intrigued photographer Sheeler consisted of two separable figures, each of them possessed of amazing life and action. They are stylized but not sufficiently so to disturb their naturalistic qualities. The composition is called The Bulldozer. With a many-gallon sombrero, outstretched arms, and bowed legs shaped to fit the back of the bull from neck to rump, the diminutive cowboy rider has hook-clinching hands which attach him to the bull's horns or tail. Consequently, he is master of the bull riding either forwards or backwards, and he may be placed anywhere. He can fall off the bull at any angle; he can light in any position on the ground, when he is even more unexpectedly comical, for his pose is still closely allied with the bucking bull. To move The Bulldozer, in the least, is to create a different composition; therefore, *"to play"* with Hebald's ably conceived and executed group is to put on an endless rodeo act.

RANDOLPH WARDELL JOHNSTON

Entirely different in theme and character, but similar in that the figures are detached, is a group of small sculptures included in the large one-man show of Randolph Wardell Johnston, teacher of sculpture, at Smith College. This unusual conception is entitled The Five That Escaped, meaning Nazi persecution. The characterization of these bronze figures is easy to imagine, though one might challenge the ability of the artist to convey in any medium an adequate idea of the state of mind produced by such suffering, passing over the indescribable reaction upon the mind and spirit of one doomed, and then rescued, from such a fate. However, in so far as different groupings might present with varying emphasis their tragic experience, the sculptor has made it possible to adjust the figures to numerous phases of interpretation.

THE IDEA OF DETACHED FIGURES

The idea of detached figures is not new; it is the modern presentation that surprises the observer. Johnston, most definitely, and Hebald, in a way, have had predecessors. Michelangelo had a majestic sort of unity in mind for his vast project that would have been the Tomb of Julius II. Rodin's "Gates of Hell," upon which he worked for upwards of a quarter century, would have been an assemblage of sculptures portraying the tragic end of all humanity. In later years, Rodin with his Calais commission, greatly simplified the drama, but he made it current history—personal and local—when he sent forth the Bourgeois de Calais, to deliver the keys of the city to their conquerors. This detached, sculptured group aroused comment throughout the art world. The work, however, that is more nearly akin to that of Hebald, is that of Eli Nadelman's detached caricatures, in which with chairs and tables, he depicts café scenes from Paris sidewalks.

THE ABSTRACT ELEMENT

As the seasons pass, the abstract element is coming into greater prominence in sculpture. The nature of the art adds greatly to the difficulty of abstractions in a sculptured form. There is always the danger of getting too near the forms that belong to machinery, which, though they might possess a type of beauty, are too commonplace to take on aesthetic value. Therefore, the abstract in sculpture is largely dependent upon a newly invented form, or shape, and such originality is rare. Movement, which has been a goal for both sculpture and painting, as described in the previous detached examples, becomes static or temporarily fixed, the instant the groups are readjusted; consequently, it is through Alexander Calder's Mobiles and Stabiles—and those who imitate them—that one sees the two qualities of movement and abstraction. Calder's compositions are far in the lead of all such endeavor.

In 1945, New York's Museum of Modern Art exhibited one of the most lovely and intricately designed Calder compositions. It is made of aluminum steel wire, a medium that supplies a soft, appealing color and abundantly rich detail to the object, which is from the collection of Mrs. Meric Callery of New York. This example differs from other Mobiles or Stabiles that have been exhibited; there is a unity in it that grips the imagination. There is the feeling that suddenly the trappings of something splendid—maybe a pipe organ—have fallen away and left the soul quite bare.

WOOD SCULPTURE FROM THE SIERRAS

A pre-holiday exhibition of something utterly novel in sculpture aroused unexpected and widespread interest in San Francisco, where it was shown in Gump's Galleries. Upwards of 50 examples—a small portion of a large reserve—represented the effort and appreciative discernment of two Berkeley women, Mrs. Emily Nelson, a painter of ability, and Mrs. Helen Snyder, a clever operator in several of the more difficult crafts.

Deprived of artistic supplies by priorities and war shortages, and conscious for years of the beauties in the wastewood with which the high Sierras, where they spend their summers, are strewn, in 1945 they brought down some choice specimens. Here in a wonderfully equipped shop, they cut away the pulpy dead wood and soft bark until they reached the hardwood kernel. Impossible attenuations were snipped off. A base was then flattened at the best angle, and the piece mounted upon a similar or contrasting wooden block; some were perched upon ivory. As a preservative, the pieces were waxed or oiled, with the result that figures and forms, abstractions and grotesques, that would have baffled the world's most skilful sculptors of wood, stood out to astonish the observer. In subject —as they impressed the visitors—the examples passed from snakes to birds, to fish and mastodons, from devils to saints and seated Madonnas. Many were of such outstanding Greek character that a student of Greek sculpture could almost name them. The amazing part of all of it was that there was scarcely a naturalistic quality in a single example. They were familiar only as the visitor was acquainted with sculpture.

From surfaces of ivory smoothness to rhythmic decoration so fine that it beggars description, the pieces—each unique and impossible to reproduce—abounded. Gouged depressions, nobules fittingly placed, swirled lines so fine that they rival fingerprints; flowing, repetitive lines of extraordinary beauty and richness adorn many pieces. In addition, some of the wood carries wholly unexpected color. In size this new sculpture, plucked from the birth-to-death process of improvident Nature, as old as yesterday in its conception but anywhere from 2,000 to 4,000 years according to its tree-rings, weighs a ton or upwards, in contrast with tiny bits that can rest on the palm of the hand over which the finger-tips may close.

Whatever of crudeness remains inherent in the wood lends strength to the object. The beauty born of the wood's struggle with the elements and life is so different in its power that it is an embarrassment to the artificial charm wrought by a mallet and chisel.

ARCHITECTURE

By Frank G. Lopez
Editor, *Progressive Architecture*

CHANGING PROFESSIONAL PRACTICE

During 1945, the practice of architecture changed. Some of the changes can be roughly evaluated; others, more intangible, are less easy to assess. The business aspects of professional practice was profoundly affected by the war and by its termination. In so far as architecture is a science, architectural thought was stimulated by the scientific activity of wartime, although measurable results are limited. The social significance of architecture, which was beginning to gain recognition before Pearl Harbor and seemed about to assume its true importance when, during the war, people in widely diverse regions of the country began to plan ahead for better cities, better housing, better buildings of all sorts, has been partly submerged by the first waves of post-war prosperity. Another side of professional practice is harder to evaluate, although it has no less importance: the trend toward contemporary design, not just what is loosely called "modern" architecture, but rather a true, original expression of contemporary *mores* by means of available materials, as opposed to stylistic or eclectic design.

THE HOUSING AND CONSTRUCTION SITUATION

As successes multiplied on the war fronts, prophecies of housing shortage began to be heard, but nothing much was done about an obviously bad situation. During the war construction had been practically at a standstill because of the War Production Board's necessary Order L-41. After Germany's and Japan's surrender, WPB rescinded its prohibition (Oct. 15), and for a few months anyone could build anything, materials priorities were dispensed with, and the small stocks of materials available began to vanish. There had not been time to replenish them; production for peace could not begin on a sufficient scale to satisfy the tremendous accumulated demand until designing and production facilities had been "reconverted." The public, too, had more money to spend and had grown accustomed to the marvels of war production, so that many manufacturers were impelled to produce new or improved building products and equipment; the old would no longer satisfy.

With the flow of supplies thus a trickle when a spate was needed, and with the housing crisis so acute that both the public and politicians could no longer ignore it, the Civilian Production Administration, successor to WPB, began to formulate a new method of control over construction. In December, CPA announced a tentative program of priorities on certain key building materials, to be applied shortly after the new year began. The intent was to channel available critical materials into low-cost housing.

No limit was to be placed, however, on what kind or price-class of construction might proceed—if materials could be secured.

Though confused, the materials situation was simple in comparison with the status of architectural practice. Aside from war work, a few architects had been busy on private projects for post-war construction. For a time, termination of hostilities and the rescinding of Order L-41 speeded up such work; and the difficulties which led CPA to reestablish materials priorities caused no appreciable slowdown. More and more offices became busy as plans for private building multiplied tremendously, and in spite of difficulties actual private construction contracts increased to levels comparable with those of the most active pre-war years. Everyone recognized that the increase, even so great, was yet not great enough.

THE POST-WAR MANPOWER FACTOR

At the same time the profession was suffering from an acute manpower shortage. Trained men and women had perforce drifted to other occupations during the architecturally idle years, some to war production in aviation, ship design, etc., some to the more "essential" civilian pursuits, some to the armed services; of these, some will never return to architecture. Those who come back have much catching-up to do; their skills are rusty, and technical advance has not waited for them. Meanwhile, the architectural schools have had low enrollments and fewer graduates, so that this source of continuing manpower replacement has temporarily run nearly dry. However, post-war enrollments show signs of substantial increase.

THE DESIGN PROBLEM

Reflected in the attitude and capabilities of those students who have graduated from school to office is another difficulty that besets the architectural practitioner. It is also expressed in professional magazines. It is discussed with the "standard" solution to an architectural problem, or to state it positively, appreciation and preference for, and to a varying degree training in, what might be termed the exploratory approach to design. This consists of a thorough original analysis of the needs a given structure must satisfy, and a solution based upon logic, in whose development the extraneous is ruthlessly discarded, the essential equally ruthlessly exploited. The approach is not easily comprehended by those who were trained otherwise, and the frank, honest results achieved by its application have, in many cases, repelled not only the designer schooled to revere precedent but also the pseudo-sophisticated client who has a position to protect. There is ample testimony, however, that the unpretentious client who has a rigid need to get him the most for his money, and the rich one who can afford to be different, is increasing in number, in appreciation of contemporary design; and their architects are developing the capacity to apply those subtle refinements of program and solution which are the only true bases for the sound formulation of an indigenous contemporary esthetic, or for development of a true "style," a different matter than the indiscriminate copyism from which most American architecture has suffered.

THE MODERN TREND IN HOUSE DESIGN

Periodicals have played a great part in this trend, particularly as it applies to house design. The manufacturer has accepted the modern trend in design of industrial buildings because it accents efficiency, although many plants are still burdened with impressive, stylish front offices, and others are falsely, tiresomely streamlined. The shopkeeper has accepted it for stores for much the same reasons and because he has to pay exhorbitant rentals for small footages; and because it is stylish and his business thrives on style. The home-owner, on the other hand, is slow to accept it. Modernism is relegated to bathrooms, kitchens, laundries, heating plants, lighting systems, radio, television, telephone, plumbing, and the like. The shell of the house, generally speaking, and what are loosely called "living" quarters—living room, bedroom, dining room—remain strongly reminiscent of past glory. Except for a few examples, this anomaly exists in most American houses. It is deep-rooted, and there is much honest, serious doubt that better houses would automatically result if it were abolished; yet in the face of such persistent habit, not only the professional publications but also ladies' and household magazines, as well as five- and ten-cent weeklies, have begun to explore what they popularly call the modern style. Whether *The Ladies Home Journal* and *Life* magazines publish contemporary houses out of sincere belief or to exploit them does not matter here; what does matter is the unexpectedly enthusiastic response of their readers. It matters because the architect, generally speaking, gives his client what the client wants. The architect, who, like a doctor, can successfully prescribe what is best for his patient, is still rare.

POST-WAR CONDITIONS AND PLANNING

Speaking from the point of view of the sincerely progressive architect interested in contemporary design, there are other regressions. During the war, while the successful conservative's energy was turned to making money out of producing for destruction, many people began taking stock of their environment. They did not like what they found. They sincerely believed the war was being fought for a better world, however hackneyed the phrase might be, and in many cities they began to agitate, to meet, to survey existing conditions, and eventually to plan to better them. The first national indication of opposition to planning came before 1945, when the National Resources Planning Board was sabotaged in Congress. NRPB, among other things, had fostered city planning. Portland, Ore. was one sphere of such activity, and when NRPB vanished, the people of Portland found ways to carry on. Yet the reasonable, realistic, and progressive plan submitted by the Portland commission was overwhelmingly rejected in the 1945 elections. Toledo, O. underwent a similar experience, but here there were other factors at work. The scheme proposed by Norman Bel Geddes & Company was exalted rather than realistic.

TENNESSEE VALLEY AUTHORITY

Structures actually completed during the year were limited, as they had been all during the war, to war-productive building and to a few essential works such as schools and hospitals. War housing was substantially completed early in the year. Noteworthy as a social advance was the emphasis on community facilities—an advance which will probably become a casualty as pragmatists regain ascendancy. The Tennessee Valley Authority completed the last of its great dams, bringing to a close TVA's great period of expansion, a period unparalleled in the world's history. For TVA, now begins the era of consolidation, less exciting but potentially more dangerous because great power, temporal and physical, is concentrated in it, an era in which those entrusted with sober development must constantly guard against unwise exploitation. Architecturally, the transition is significant for many reasons, among them the successful completion of a vast, costly program; the interest of technicians, planners, and politicians from all the depressed regions of the earth—from Europe, from the Soviet, from India, from South America, to name a few; and the quiet dispersal of many of the architectural men who assisted TVA from birth to puberty, whose talents lay in creation, not in maintenance.

OAK RIDGE, TENNESSEE

Of nowhere near comparable significance—really not comparable—yet astounding in its implications, was the Manhattan Project, the U. S. military agency that developed the atomic bomb. Of the several factory-cities all built from scratch, that in the

Tennessee Valley, called Oak Ridge, is the most completely documented architecturally. The municipality of Oak Ridge did not exist, even in name, on Nov. 1, 1942. By the autumn of 1945 it was a city of 75,000 inhabitants, all employed in producing the atomic bomb—the fifth largest city in Tennessee, complete with the most extensive, solidly built industrial buildings, with houses, multifamily dwellings, dormitories; recreational, educational, shopping, and health facilities—theatres, schools, stores, community center, hospital, clinics. Oak Ridge was developed in stages; the first, early in 1943, consisted of 3,000 houses designed by Skidmore, Owings, and Merrill in conjunction with the John B. Pierce Foundation, laid out in three planned neighborhoods with a central shopping district. Late in 1943, 5,000 more dwellings were added; these were TVA units of the type first developed by TVA architects to house personnel engaged in construction of dams. In July 1945, a third increment of 1,500 houses was started.

Although Oak Ridge was an emergency job, and was thus rushed to completion almost overnight, it was also an intelligently planned community—one of the best, considering all its phases, in the country's history. The standard of design for most of the structures was exceptionally high, especially in view of the assembly-line, mass-production techniques employed in their construction. Each type of operation was allotted to its specially selected crew, which moved from structure to structure performing its specialty and was followed by another crew of specialists, and another, until a whole group of buildings was completed. Some structures were permanent, some temporary; the factories were the most solidly built of all. Perhaps the most striking fact was that no hint of Oak Ridge appeared in the press until its products were loosed on Japan. Perhaps the most ironic is that the substantial factories will undoubtedly become obsolete within six months, as knowledge of atomic production increases; while even the temporary houses may function satisfactorily for years.

HOSPITAL DESIGN

Other noteworthy developments during the year included standard plans for hospitals and hospital units, clinics, etc., prepared by the U. S. Public Health Service under the guidance of Marshall Schaffer, chief architect. Thoroughly documented in the architectural press, these will undoubtedly influence hospital design strongly.

EXAMPLES OF NON-WAR DESIGN

Almost uniformly, work published in the architectural magazines was contemporary in handling. At the same time, there was increasing emphasis on appeal to the senses, whether in advantage taken of pleasing sites or in refinement and full development of the possibilities of the buildings themselves. There was a conscious probing into the relations of buildings to their surroundings. While ornament for ornament's sake was still anathema to editors and to the architects whose work they published, so also was stark nakedness. Of the non-war work, some pre-war, some pre-1945, some projected post-war, a few examples stand out: Midland Hospital, Midland, Mich., by Alden B. Dow; Little Traverse Hospital, Petoskey, Mich., by Skidmore, Owings & Merrill; Sill Building, demountable modular office building in Bakersfield, Calif., by Franklin & Kump; the proposed Schenley Building for Cincinnati, O., by Woodie Garber; the proposed United Nations Center for San Francisco, by Wurster, Bernardi & Born, destined never to be built; the proposed plans for Toledo and for Portland, Ore., likewise stillborn as previously noted; and houses in Petaluma and Redwood City, Calif., by W. W. Wurster; in Claremont, Calif., by Millard Sheets; in Bowmanstown, Penn., by Paul Beidler; in San Francisco, by Gardner Dailey; and in Dobbs Ferry, N. Y., by Julius Gregory. There were also Carmel High School, Carmel-by-the-sea, Calif., by Franklin & Kump, which proved that logical modular design did not rule out prettiness; and Perkins, Wheeler & Will's Rugen School, in Glenview, Ill., in which logical design approached beauty.

EXAMPLES OF WAR CONSTRUCTION

Buildings whose construction was caused by the war included: Washington, D. C., Port of Aerial Embarkation, by Charles M. Goodman; schools, theatres, and community buildings in war housing projects, notably those in and near Seattle, by Stuart, Kirk & Durham; Jones, Bouillon, Thiry & Sylliaassen; and Pietro Belluschi; similar buildings in Vallejo, Calif., by Bernardi, Wickenden, Langhorst, and Funk; Jackson School, Wayne Co., Mich., by O'Dell, Hewlett & Luckenback; the Consolidated-Vultee Airplane Plant at Fort Worth, Texas, by the Austin Co.; and the Headquarters Building, Hershey Metal Products Co., Ansonia, Conn., by Leo F. Caproni, who demonstrated that it was not necessary to resort to vulgar display to impress those who entered a manufacturer's offices.

In this list there are many new firm names. Others have appeared in professional journals and in lists of work in progress offered by the purveyors of construction news; and a great percentage of the new names are responsible for private work. Public works generally, particularly in the larger metropolitan centers, are being entrusted to well established old-line firms. This is to be expected, and it is not unhealthy, considering that the United States is a democracy, to have the stimulus to change, to advance, come from private life rather than from an omnipotent higher authority.

MUSIC AND THE OPERA

By RONALD F. EYER

EDITOR, *Musical America*

GENERAL

A year which brought some of the most difficult days of the war and then sudden victory in two hemispheres was an eventful one for music. Transportation problems which were foreseen as a serious deterrent earlier in the war, affecting the movements of performers and public alike, were solved or compromised with remarkable resourcefulness. There were no casualties among important musical institutions because of war conditions.

On the contrary, music received a marked stimulus during the war period, attributable in large part, no doubt, to the unusual amount of "free money" circulating among the civilian population which could not be spent on consumer goods and thus went in larger quantities for entertainment and cultural pursuits of one kind and another. This condition was quickly reflected in the concert halls and opera houses of the nation. "Standing room only!" was a common cry at musical performances, and the Metropolitan Opera Association ended its 1944-45 season with that greatest of operatic novelties—an operating profit. Many leading concert artists and soloists had offers of more engagements than they possibly could fill, and the situation generally was highly productive, financially as well as artistically.

Virtually all musical artists, including such stars as Lily Pons, Marjorie Lawrence, Jascha Heifetz, and Yehudi Menuhin, to mention only a few, gave generously of their time and energy to the entertainment of American servicemen at home and abroad. Some circled the globe to sing and play for the men in the remotest theaters of operations under the auspices of the United Service Organizations. Many symphony orchestras also gave special performances for members of the armed forces, frequently traveling to army camps and naval stations for such appearances. Although the war is over, millions of men still are in uniform, and the need for such entertainment is still felt. Most artists, therefore, continue to allot considerable time to service performances.

OPERA AT THE METROPOLITAN

The first performance of the year at the Metropolitan, coming in the midst of the company's 1944-45 season, was a routine performance of "Aïda." However, the second half of the season included several of the year's most significant revivals. On Jan. 12, 1945, Wagner's "Die Meistersinger" returned to the repertoire after an absence of five years. This work had been off the boards for that period, partly because there seemed to be no immediate successor to Friedrich Schorr (retired) as Hans Sachs, and partly because stories had been circulated that there was some connection between the opera and certain phases of the Nazi ideology, the latter, of course, being arrant nonsense. Herbert Janssen was the new Sachs, with Eleanor Steber, Kerstin Thorborg, Charles Kullman, and Gerhard Pechner in the other leading roles. Rimsky-Korsakoff's "The Golden Cockerel" returned in an English version on March 1 with Patrice Munsel and Norman Cordon as the leading protagonists. "La Gioconda," preceding this on Jan. 25, also was something of a novelty. The two "Ring" cycles, the first beginning Feb. 2, the second March 17, was made notable by the presence of George Szell at the conductor's desk. The latter date also saw the revival of Beethoven's "Fidelio," sung in English by an almost completely American cast. Bruno Walter conducted. The final performance was "Götterdämmerung" on March 31, whereupon the company embarked on its post-season tour, giving 12 performances in Boston, eight in Cleveland, seven in Chicago, two in Milwaukee, four in Minneapolis, and one in Rochester.

The 1945-46 season opened on Nov. 26 with "Lohengrin" in which Torsten Ralf, Swedish tenor, and Fritz Busch, conductor, made their Metropolitan debuts. This was the first revival of the season which was also to bring Gounod's "Romeo et Juliette," Verdi's "The Masked Ball" and "Otello," "Don Pasquale" in double bill with Puccini's "Il Tabarro," as well as the latter's "Madame Butterfly" and "Tosca," Offenbach's "Tales of Hoffmann," and Strauss's "Salome." Busch was scheduled to conduct a centennial revival of "Tannhäuse."

Among important debuts of the year, in addition to those already mentioned, were those of Mimi Benzell in "The Magic Flute" on Jan. 5; Frederick Gynrod in "Tristan und Isolde" on Feb. 3; Richard Tucker in "La Gioconda" on Jan. 25; Kenneth Schon in "Fidelio" on March 17; Dorothy Kirsten in "La Boheme" on Dec. 1; Pierette Alarie in "The Masked Ball" on Dec. 8; and Robert Merrill in "La Traviata" on Dec. 15.

No essential changes took place in the Metropolitan Opera administration or operations during the year except that the opera house itself for the first time was exempt from real estate taxation. This fact made possible the operating surplus mentioned before. An important gift was a check for $30,000 presented on the occasion of its tenth anniversary by the Metropolitan Opera Guild to be used for mounting new productions. Edward Johnson continues as general manager.

OTHER OPERA

The Chicago Opera, the San Francisco Opera, and the New York City Center Opera also enjoyed successful tenures during the year. The Chicago and the San Francisco companies are largely duplications, both in casts and in productions, of the Metropolitan, although their local character is maintained in the chorus, ballet, and orchestra and in the overall direction.

Chicago had a six weeks' season opening on Oct. 8 with "Manon" which was a revival in that city. Other revivals there were "The Barber of Seville," "The Marriage of

Figaro," "Parsifal," "Cavalleria Rusticana," "Pagliacci," and "Forza del Destino." In addition to its home season, the company gave three performances in Milwaukee.

The San Francisco season began with "Carmen" on Sept. 25. Four weeks had been planned, but so great were the box office demands that a fifth week was added. Transportation difficulties forced the cancellation of scheduled appearances in Seattle and Portland, but the company had its regular two weeks' season in Los Angeles with performances also planned in Sacramento and San José.

Wagner's "The Flying Dutchman," not heard in New York in several years, was the first performance of the spring season at the New York City Center on April 12. Other works presented were "Faust," "La Traviata," "Cavalleria Rusticana," "Pagliacci," "The Gypsy Baron," "Manon Lescaut," and "La Boheme." A revamped version of "La Vie Parisienne" was given a pre-season performance on Jan. 12. The fall season began on Sept. 27 with "Tosca" which, with "The Bartered Bride," augmented the same repertoire as was given in the spring.

TOURING OPERA

Prominent among the touring companies was the Philadelphia La Scala which gave a series of six festival performances in Pittsburgh May 3-9. Its 1945-46 season began on Sept. 24 with a repertoire of 21 operas and included scheduled performances in Detroit, Buffalo, Pittsburgh, Washington, and Baltimore, in addition to 15 in Philadelphia. The San Carlo Opera Company, in addition to its traditional tour, had a New York season May 16-26. In Newark, N. J., the Griffith Music Foundation sponsored an opera festival of six performances on May 10 to 15. The Cincinnati Summer Opera presented 18 works between June 24 and Aug. 4, and Dayton, O., had its regular festival of six performances on May 16 to 20. Local opera ventures also prospered in Hartford, Conn., Trenton, N. J., New Orleans, La., Union City, N. J., Flint, Mich., and other smaller communities.

MUSIC FESTIVALS

Prominent among general music festivals was the venerable Worcester Festival which entered its 86th year on Oct. 8. The Philadelphia Orchestra, under Eugene Ormandy, was the main participant, aided by a list of soloists including Dorothy Maynor, Rudolf Serkin, Donald Dame, Stella Roman, Jean Watson, and Lansing Hatfield. Major works performed were the Rossini "Stabat Mater" and Marion Bauer's cantata, "China."

In addition, there were Columbia University's first annual festival of American music on May 12; the Tanglewood Festivals, directed by Serge Koussevitzky, July 28-29, and Aug. 4-5, 11 and 12; the Bethlehem Bach Festival, conducted by Ifor Jones, May 18-19; the Philadelphia Bach Festival May 25-26; the Ann Arbor Festival, May 3-6, and the Piedmont Festival, July 25-28. Most of the festivals, with the exception of those devoted exclusively to Bach, presented varied programs embodying orchestral, choral, solo, and sometimes operatic elements. Some of them introduced new compositions which are mentioned elsewhere in this article.

NEW YORK PHILHARMONIC SYMPHONY

The New York Philharmonic Symphony, the oldest symphony orchestra in America and one of the two oldest in the world, began its 104th season in Carnegie Hall on Oct. 4 under the baton of its musical director, Artur Rodzinski. The closing weeks of the previous season were peculiarly marked by the death of President Roosevelt on April 12 when a regular subscription concert on that evening was cancelled, the first such cancellation by the Philharmonic since the assassination of Abraham Lincoln. Shortly before, on March 29 and April 1, Bruno Walter had conducted notable performances of the "St. Matthew Passion." With broadcasts every Sunday under the sponsorship of the

U. S. Rubber Co., the Philharmonic Symphony has become a year-round orchestra, and its activities have wide ramifications. Beginning June 18, it took up its nightly duties at Lewisohn Stadium where it continued for eight weeks under a series of guest conductors including Alexander Smallens, Leonard Bernstein, Eugene Goossens, Fabien Sevitzky, and Ignace Strasfogel.

Conductors for the regular Winter season of 1945-46, in addition to Rodzinski, were George Szell, Bruno Walter, Igor Stravinsky, and Howard Hanson. Young Walter Hendl was engaged as assistant conductor. Rudolph Ganz continued as conductor of the children's concerts. There were no appreciable changes in the regular concert schedules from recent seasons. The weekly subscription concerts on Thursday nights, Friday afternoons, and Sunday afternoons, were supplemented as usual by the special students series on Saturday nights. One of the most comprehensive undertakings of the season was a performance of the complete third act of "Die Walküre" in concert form on Nov. 22. Helen Traubel and Herbert Janssen were the principal soloists in this excerpt under the baton of Rodzinski.

NBC SYMPHONY

The NBC Symphony continued to be heard over the air weekly on Sunday afternoon from 5 to 6 o'clock under the commercial sponsorship of General Motors. Arturo Toscanini is regular conductor of the orchestra's winter series, while Frank Black takes over during the summer. Occasional guests officiate during Toscanini's term. Eugene Ormandy and the British conductor, Malcolm Sargent, were guests during the first half of the year, and their places were taken in the second half by Dimitri Mitropoulos and Erich Kleiber. The winter series began on Oct. 28, marking Toscanini's eighth year at the helm.

NEW YORK CITY SYMPHONY

An important newcomer to the New York orchestral scene is the New York City Symphony, founded at the City Center by Leopold Stokowski and now conducted by Leonard Bernstein. The orchestra gives a series of 12 Monday evening concerts extending fortnightly until April 1. These are supplemented by a series of concerts on Tuesdays at 6 p. m., an unusual hour chosen for the convenience of patrons who are unable to attend performances later in the evening. This has proved a highly successful innovation.

PHILADELPHIA ORCHESTRA

The Philadelphia Orchestra concluded its 1944-45 season on April 27 with a total of 150 concerts, 48 of which were given on tour in the United States and Canada. In addition to its own schedule, it appeared in conjunction with the Worcester and the Ann Arbor festivals. The annual summer concerts at Robin Hood Dell, now in their 16th season, took place between June 18 and Aug. 3 with Dimitri Mitropoulos occupying his new position as artistic director and conductor. The Orchestra's 46th season began on Sept. 28 under its regular conductor, Eugene Ormandy, with plans for 28 pairs of regular concerts in addition to various series of special concerts and a number of out of town appearances in New York, Baltimore, Washington, Richmond, Harrisburg, and other cities. Among guest conductors are listed Pierre Monteux, Bruno Walter, Saul Caston and Alexander Hilsberg, new associate conductor.

BOSTON SYMPHONY

After a brief respite following the conclusion of its 1944-45 season on April 28, the Boston Symphony launched into its 60th season of "Pop" concerts on May 1 under the direction of Arthur Fiedler. Guest conductors, occasionally relieving the veteran, Serge Koussevitzky, during the preceding winter series, were George Szell, Hietor Villa-Lobos, and Richard Burgin. The usual Esplanade concerts followed the "Pops" during the summer, and the orchestra resumed its regular activities at Symphony

Hall on Oct. 5, beginning the orchestra's 65th year. The customary 24 Friday afternoon concerts and 24 Saturday night concerts were slated, with plans for a new series on Sundays, as well as the traditional out-of-town engagements in New York and elsewhere. An important new element in the Bostonians' activities is the series of Saturday evening broadcasts sponsored weekly by the Allis-Chalmers Co. These broadcasts are of one-hour duration and originate in whatever city the orchestra happens to be playing in at the time.

CHICAGO SYMPHONY

The Chicago Symphony, of which Désiré Defauw is conductor and Hans Lange, assistant conductor, planned 106 concerts in Orchestra Hall for 1945-46 with a list of 22 soloists engaged. The 28 pairs of subscription concerts on Thursday evenings and Friday afternoons began on Oct. 4 and were supplemented by 12 Tuesday afternoon events, 16 popular concerts, and 12 concerts for young people, the latter on the first and third Tuesdays of every month. The orchestra also gives 10 concerts in Milwaukee during the year and makes weekly broadcasts over radio station WCFL under the sponsorship of the Chicago Title and Trust Co.

CLEVELAND ORCHESTRA

The return of Erich Leinsdorf from the Army placed him again in charge of the Cleveland Orchestra where he has Rudolph Ringwall as his associate. Vladimir Golschmann and George Szell were engaged for guest appearances on the podium. A heavy calendar of events opened on Oct. 11 and called for 20 pairs of subscription concerts plus 10 to 14 summer popular concerts, 14 twilight concerts, 24 educational programs, and 34 concerts on tour. Dr. Ringwall gives two series in the twilight group, and 12 soloists were engaged for various performances.

SAN FRANCISCO SYMPHONY

Saturday night concerts have proved particularly popular with patrons of the San Francisco Symphony which opened its 1945-46 season on Nov. 23. With Pierre Monteux as conductor, the orchestra gives three regular subscriptions series: 12 Friday afternoons, two Thursday nights, and 14 Saturday nights. Soloists appear in most programs. In addition to the regular series, there are four young people's concerts, conducted by Rudolph Ganz, and out-of-town engagements at Fresno, Berkeley, Stanford University and San José. The Golden Gate players also are heard in eight Standard Symphony broadcasts. The season closes on April 13.

LOS ANGELES PHILHARMONIC

The Los Angeles Philharmonic, which ended its 1944-45 season on April 5, resumed operations on Nov. 15 with a program of 86 concerts in Los Angeles, San Diego, Claremont, Beverly Hills, Whittier, Long Beach, Alhambra, Pasadena, San Pedro, Santa Monica, Santa Barbara, Glendale, San Fernando, Bakersfield, and Van Nuys—46 home concerts, 40 outside. A highlight of the fall season was Verdi's "Requiem" on Nov. 22-23 with Rose Bampton, Eula Beal, Frederick Jagel, and Douglas Beatty as soloists. Otto Klemperer was guest conductor on Dec. 13 and 14. The orchestra also gives 13 concerts, called Symphonies for Youth, which are broadcast by the American Broadcasting Co. Alfred Wallenstein is musical director and principal conductor.

DETROIT SYMPHONY

The spectacularly revitalized Detroit Symphony opened its fall season on Oct. 25 with Karl Krueger, conductor, and Valter Poole, assistant conductor. At Masonic Auditorium, the orchestra gives 20 Thursday evening subscription concerts, ending March 14. Two special concerts at Music Hall, Dec. 27-28, were conducted by Poole with Eugene List as soloist. A series of children's concerts are given on Wednesdays.

CINCINNATI SYMPHONY

A widely varied schedule of concerts was planned for the Cincinnati

Symphony's 1945-46 season. With Eugene Goossens as conductor, the orchestra set out on a schedule on Oct. 5, calling for 20 pairs of subscription concerts in the local Music Hall besides three performances in conjunction with the Ballet Theatre, three young people's concerts, two junior high concerts, seven popular concerts, and 35 out-of-town engagements through the East, South, and Middle West. Leonard Bernstein was guest conductor on Nov. 2-3. The orchestra concluded its Golden Anniversary year on April 12, during which there were several special concerts and anniversary observations.

MINNEAPOLIS SYMPHONY

The Minneapolis Symphony, which makes its home on the campus of the University of Minnesota, serves both its home city and St. Paul under the directorship of Dimitri Mitropoulos. Yves Chardon is assistant conductor. The season extends from Oct. 26 to April 5 with a total of 39 concerts, 18 of which are regular Friday subscription concerts. Leonard Bernstein and Erich Leinsdorf were engaged as guest conductors for the regular series. In addition, the seven Sunday twilight concerts brought Tauno Hannikainen in a guest appearance on the podium; there were three performances with the Ballet Theatre; nine young people's concerts as well as a pension fund popular concert, an extra concert with Marian Anderson as soloist; a concert at St. Olaf College and three in Winnipeg were on the agenda.

ST. LOUIS SYMPHONY

Vladimir Golschmann, with the assistance of Harry Farbman, directed the artistic course of the St. Louis Symphony. The season extends from Oct. 19 to March 2 with 20 pairs of subscription concerts, including 20 concerts on Saturday nights and 10 each on alternate Friday and Sunday afternoons. The orchestra also gives six school concerts, several "Pop" concerts, and extra concerts with visiting conductors. This year Leonard Bernstein was a guest batonist. Four appearances with the Ballet Theatre were scheduled for after the first of the year.

INDIANAPOLIS SYMPHONY

The Indianapolis Symphony, Fabien Sevitzky, conductor, had the unusual distinction in its 1945-46 season of playing more concerts on tour than in its home city. A total of 35 cities in 12 states were to be visited by the orchestra between Nov. 8 and March 5, 1946. Most of these cities were in the East and the Middle West. In Indianapolis, a series of 12 pairs of subscription concerts, beginning Nov. 3, were planned with Sir Ernest MacMillan announced as guest conductor in one pair. Other local performances included three children's concerts, a municipal concert, and two appearances with the Indianapolis Symphonic Choir.

KANSAS CITY PHILHARMONIC

A subscription series of 10 pairs of concerts form the backbone of the season for the Kansas City Philharmonic, Efrem Kurtz, conductor, and David Van Vactor, assistant conductor. These concerts take place on Tuesdays and Wednesdays. There also are six popular concerts on Sunday afternoons and two series of children's concerts. Twenty half-hour broadcasts over KMBC and three appearances with the Ballet Theatre round out the season.

ROCHESTER PHILHARMONIC

Guest conductors directed the affairs of the Rochester Philharmonic. Among these were Artur Rodzinski, Leonard Bernstein, Dimitri Mitropoulos, Sir Thomas Beecham, and Guy Fraser Harrison who is the orchestra's assistant conductor. The 12 evening concerts given in Rochester began on Nov. 1, continuing until March 21. There also were 10 concerts planned in other cities with conductorial duties equally divided between Bernstein and Sir Thomas.

THE NATIONAL SYMPHONY

The National Symphony in Washington, D. C. serves the nation's capital with a widely diversified program of activities. Under the baton of Hans Kindler, the orchestra gives 10 subscription concerts on Sundays and 9 all-subscription concerts on Wednesdays. Special features in 1945 included four performances with the Ballet Theatre and four with the Ballet Russe. There were three of the "15/30" series for young people and six for Washington school children with Olga Samaroff-Stokowski as commentator. An innovation was two special concerts for members of the National Symphony Orchestra Association, one of which featured American compositions.

BALTIMORE SYMPHONY

Reginald Stewart is in charge of the musical fortunes of the Baltimore Symphony, with Ilya Skolnik second in command. In the subscription series there are 12 Wednesday evening concerts and two on Thursdays, as well as two series of Sunday evening performances sponsored by the Board of Municipal Music, 12 popular programs, five students' concerts, and three performances with the Ballet Theatre. Out-of-town appearances, in addition to Washington and Annapolis, include a northern tour taking in New York State and several Canadian cities, and a later southern tour extending from Virginia to Florida. There also are four radio concerts on WBAL.

SAN ANTONIO SYMPHONY

Three opera performances ("Carmen," "Tosca" and "La Traviata"), with Metropolitan artists, figured in the 1945 plans of the San Antonio Symphony which recently joined the ranks of major orchestras. Conducted by Max Reiter, the orchestra scheduled 15 subscription concerts, ranging from Nov. 10 to March 20. Sir Thomas Beecham was invited as visiting conductor for one concert.

PITTSBURGH SYMPHONY

Special concert performances of "Salome" and "Boris Godunoff" were highlights of the 1945-46 season of the Pittsburgh Symphony, of which Fritz Reiner is conductor and Vladimir Bakaleinikoff, assistant conductor. The purely orchestral list called for two subscription series of 20 Friday evenings and 20 Sunday afternoons, besides children's concerts in various local high schools, a series of eight popular concerts on Tuesday evenings, conducted by Bakaleinikoff, and featuring well known soloists.

NEW ORLEANS SYMPHONY

With a new conductor in the person of Massimo Freccia, the New Orleans Symphony launched its season on Nov. 13 with the prospect of 14 subscription concerts, one extra concert, and 10 young people's concerts followed by a tour of five cities.

LOUISVILLE AND HOUSTON

The Louisville Philharmonic, Robert Whitney, conductor, began a series of six concerts on Oct. 9 as well as a series of weekly sponsored broadcasts over WAVE. Conducted by Ernst Hoffman, the Houston Symphony planned 10 regular concerts, 10 student concerts and six concerts out of town. It also had weekly sponsored broadcasts.

BUFFALO, DENVER, SEATTLE

The Buffalo Philharmonic, under William Steinberg, offered a series of 10 regular concerts, and, for the first time in its history, sold out completely. It also gave 20 popular concerts on Friday evenings and 11 children's concerts in addition to filling some engagements in surrounding communities. Saul Caston, new conductor of the Denver Symphony, led his forces in 15 concerts beginning Oct. 16. Eight pairs of subscription concerts and four young people's concerts were offered, beginning Nov. 12, by the Seattle Symphony under the baton of Carl Bricken.

NEW MUSIC

A considerable body of new music came to performance during the year though little of it, as was to be expected, showed signs of any lasting importance. Among the most interesting were two works of Villa-Lobos given their first North American performances in New York under the composer's direction. The first was his "Choros" No. 9 for Orchestra played by the Philharmonic Symphony on Feb. 8; the second was "Bachianas Brasilieras" No. 7 with the City Center Symphony on Feb. 13. The Philharmonic Symphony also gave first performances of Paul Creston's Second Symphony on Feb. 15, "Music for Symphony Orchestra" by Arthur Kreutz on March 22, and John Alden Carpenter's "The Seven Ages" on Nov. 29. On the City Center list besides were Revueltas' "Sensemaya," Fuleihan's Concerto for Theremin and orchestra, and Phillips Scherzo, on Feb. 26. Also in New York, the National Orchestral Association, conducted by Leon Barzin, presented Ernst Levy's Ninth Symphony for orchestra and mixed chorus on March 3.

The St. Louis Symphony was responsible for first readings of Morton Gould's "Harvest" on Oct. 27; Alexander Tansman's Serenade No. 3 on Nov. 10; and the "Circus Polka" from Stravinsky's "Four Norwegian Moods" on Nov. 16. Bohuslav Martinu was represented by his Third Symphony, played by the Boston Symphony on Oct. 12, and by his Fourth Symphony undertaken by the Philadelphia Orchestra on Nov. 30. The Philadelphians also brought out Paul Creston's Pastorale and Tarantella on Jan. 12; Nicolai Berezowsky's Concerto for Harp and Orchestra on Jan. 26; while the Bostonians gave a first American hearing to Prokofieff's Fifth Symphony on Nov. 9.

Celebrating its 20th anniversary, the Eastman School Festival of American Music, at Rochester, introduced several new works under the direction of Howard Hanson. Among these were Leo Sowerby's Sonata for violin and piano, Herbert Inch's Second Quartet, Paul White's "Idyl," William Grant Still's ballet suite, and "Sahdji," Robert Sander's Violin Concerto.

Normand Lockwood's opera, "The Scarecrow," was a high point among new works introduced at Columbia University's Festival of American Music on May 9, which also brought out Paul Creston's Second Symphony (previous to the Philharmonic's public premiere), David Diamond's "Rounds," a saxophone concerto by Henry Brandt, and several chamber works.

THE THEATRE

By Edwin T. Duffy

News Department, *The New York Times*

WAR AND THE STAGE

The Second World War had come to a victorious close for the Allies by August of 1945, but even with the end of hostilities the Broadway theatrical scene had undergone no drastic alteration. Grosses at the box-offices of New York's legitimate theatres continued phenomenal, and operetta presentations and musical comedy continued to be the order of the day. Among the effects of the war's end was the speedy demise of the American Theatre Wing's Stage Door Canteen and a prediction that similar organizations throughout the land would rapidly follow suit. Paradoxically, USO Camp Shows, Inc. announced an expanded program of overseas entertainment for the Allied forces stationed in occupied Germany and Japan. For more than three years, the USO had been busy filling the entertainment needs of the uniformed men and women of the United Nations throughout the world with a wide variety of dramatic fare. As might be imagined, the actors and actresses who consented to make the tour did so in the face of the most difficult transportation conditions and very often appeared under the most hazardous circumstances. With the war at an end, however, a rapid improvement in accommodations for the USO troupers seemed inevitable.

In the closing months of the conflict, what appeared to be a veritable exodus from Hollywood to the New York stage took place. Such screen personalities as Spencer Tracy, Fay Bainter, Edmund Gwenn, and Frances Dee turned up during the course of the season, and at the time this volume went to press many other notables had made known their intention to make a return to the footlights. This, in itself, was a direct result of the war years in America. Many film players were aware that former film patrons were attending the theatre in steadily increasing numbers. Thus, in order to reinforce their position on the screen, they were more than willing to make the trek to New York and give their fans the opportunity of seeing them at work on the stage. The season was further enriched by the return of such players as Laurette Taylor, Dame May Whitty, Carol Goodner, and Catharine Willard among others, all of whom had not been seen in New York for too long a time.

All in all, the theatre continued at about the same rate as in previous years. The great play to emerge from the war still had not materialized, though Paul Osborn's adaptation of the John Hersey novel, *A Bell for Adano,* had gained a comfortable run when the closing notice went up backstage. In the main, the theatre had to content itself, as far as the actual physical war was concerned, with Hersey's study of the Italian situation, a direct holdover from 1944, and a handful of minor war dramas, only one of which managed to attain a fair degree of popularity.

WAR AND RELATED THEMES

John Patrick's "The Hasty Heart" was well received by the press but failed to live up to its early expectations. The play was a human and frequently touching account of a handful of Allied soldiers stationed in Burma and of the entrance into their midst of a surly Scotsman with only a few months to live and deadbent against affection of any sort. How he is finally won over by a British nurse and an American soldier formed the basis of the play which was embellished with a trio of excellent performances from John Lund as the Yank, Anne Burr as the nurse, and Richard Basehart as the representative of the play's title. "The Hasty Heart" lasted a little more than 200 performances and has now begun what appears to be a successful engagement in London.

Two other plays attempted to present a study of the war in relation to the civilian population, those being Edward Chodorov's "Common Ground" and Capt. Ralph Nelson's "The Wind Is Ninety." The former was a drama in which a group of USO entertainers found themselves trapped by the Germans in Italy and the latter a study of the effect of the death of a serviceman on his immediate family. Luther Adler, Paul McGrath, and Nancy Noland enacted the leads in the Chodorov play with notable success, and Bert Lytell and Blanche Yurka gave good accounts of themselves in Captain Nelson's drama. "Common Ground," however, went down to early failure, and "The Wind Is Ninety" was able to stay around only for a slack summer period.

THE POST-WAR THEME

While plays dealing directly with the war were as scarce as four-leaf clovers, three productions slipped quietly into town during the year which, although faulty, definitely displayed an interest in problems facing the post-war world. The first was "Kiss Them for Me," a comedy-drama by Luther Davis stemming from the Frederic Wakeman novel, *Shore Leave.* This was an earnest little play about three Navy men returned to their native shores for a brief respite from duty. Anxious to find fun and relaxation, they run into governmental red tape, the much-maligned "Paper Navy," and a general lack of understanding on the part of the civilian population. Davis' play showed the germ of a good idea but the development was weak and the entire play rapidly fell to pieces. Elsa Shelly's "Foxhole in the Parlor" was a straight drama in which a returned pyscho-neurotic soldier was the principal character. This play was more determined but not so well written, and it lacked the necessary depth and understanding to create a favorable impression. Both "Kiss Them for Me" and "Foxhole in the Parlor" failed to build sufficient box-office strength but both were a proof that the theatre was attempting to settle down to facts.

Third, and by far the best, was "Home of the Brave," which was, incidentally, the last legitimate production of the year. An all-male cast of actors, headed by Joseph Pevney and Alan Baxter, enacted this story of a Jewish soldier's fight against intolerance. The play received divided notices, the opinion being that Laurents had made a commendable, if not entirely satisfactory, effort to get at the heart of a truly serious problem.

"DEEP ARE THE ROOTS"

It was not until almost the end of September that the theatre had a serious play based on a current problem of which it could be justifiably proud. "Deep Are the Roots," a fiery drama from the pens of Arnaud D'Usseau and James Gow, had a good deal to say about racial intolerance and pulled no punches saying it. The authors told of the return of a young Negro war hero to his home in the deep South. He has been treated as an equal abroad but finds he is expected to resume his former position of subservience in the land of his birth. The boy's liberal views are bitterly opposed by an aging Southern senator and championed with equal vigor by a crusading novelist from "Up North." The conflict is resolved when the senator attempts to frame the boy on a charge of theft. The drama receives additional power through the complex role of the senator's elder daughter, who had been the colored boy's friend and patron in earlier days but who permits the youth to be taken away to jail without offering opposition. What happened afterwards was sufficient to make "Deep Are the Roots" not only an intelligent play but also an extremely entertaining one. It was produced by Kermit Bloomgarden and George Heller and was admirably staged by Elia Kazan. Carol Goodner as the misguided liberal gave a splendid performance in what was one of the most demanding roles of the season, and Gordon Heath's portrayal of the Negro soldier was fine and dignified. Charles Waldron as the senator, Barbara Bel Geddes as the younger daughter, and Lloyd Gough as the novelist contributed excellent performances in the supporting roles. This was the first work of major consequence to deal with a pertinent issue in entirely satisfactory fashion. The success it is still enjoying at the box-office attests to its merits as a fine play.

"THE GLASS MENAGERIE"

On a warm Saturday evening toward the end of March, 1945, New York's first-nighters congregated for the first local inspection of "The Glass Menagerie," a drama by Tennessee Williams, a comparatively unknown author. The play, the writer's first to receive a New York production, had excited editorial and critical comment in Chicago and had already made a reputation for itself before embarking upon its Broadway career. Williams' study of despair and frustration in a St. Louis flat became an overnight hit after receiving the unanimous approval of the local drama reviewers. Specifically, it dealt with a faded Southern belle; her son, a disillusioned dreamer, and her daughter, a pathetic cripple hiding from the world of reality in a collection of tiny glass figurines from which the play derived its title. The action of the play revolved around the efforts of the mother to entice a gentleman caller into paying a visit to their home in the hope that her daughter might find a suitor and escape from her unpleasant situation.

This portrait of four unhappy people was a touching one but it was relieved by many moments of high comedy. As a picture of one phase of life in the American scene, it was pretty near perfection, and a small cast of four gave expert characterizations. Julie Haydon as the daughter, Eddie Dowling as the son, and Anthony Ross as the gentleman caller were all fine. The majority of playgoers and critics felt, however, that the play's most rewarding feature was that it brought Laurette Taylor back to the theatrical scene. Miss Taylor brought great feeling to the difficult role of the mother, a part which might very easily have deteriorated into a maudlin character study in the hands of a less experienced actress. The play was produced by Eddie Dowling in association with Louis J. Singer and Jo Meilziner and provided one of the most unusual stage settings of the season. At the close of the year, "The Glass Menagerie" still was playing to capacity houses at every performance.

"THE RUGGED PATH" AND "DARK OF THE MOON"

The theatrical year was marked by the return of a favorite playwright and a favorite actor. The scribe was Robert E. Sherwood with his first play since "There Shall Be No Night," and the actor was Spencer Tracy, last seen in New York in "The Last Mile" some 15 years ago. The occasion was The Playwrights' Company presentation of "The Rugged Path." Sherwood's latest play told the story of an American newspaperman who attempted to renew his faith in America by surrendering his post on a Washington daily and seeing action in the Philippines. "The Rugged Path" had one or two moments of effective theatre but too much of the play resembled an address delivered from a lecture platform. Critical response to the play was slight despite Tracy's superior job of acting. Capt. Garson Kanin directed, and an able cast headed by Martha Sleeper supported the star. The production was scheduled to end its run early in 1946.

"Dark of the Moon" was a fairly imaginative treatment of the Barbara Allen-Witch Boy legend in which a boy from the nether world falls in love with a mortal girl. The vehicle, sub-titled a "legend with music," was written by Howard Richardson and William Berney, and the Shuberts were responsible for a striking production. The critics were divided once again on the merits of the play, and, although box-office returns were far from satisfactory, it had achieved a run of several months when it was withdrawn.

COMEDIES

After a series of fumbles, the theatre finally was rewarded with three expert comedies. Howard Lindsay and Russell Crouse, who have demonstrated in the past that they know their way around a clever situation, wrote "State of the Union," a political comedy with deep social overtones. It arrived in New York after a highly successful shakedown tour out-of-town, and soon became one of Broadway's chief light attractions of the year. Delving into a region hitherto unexplored by the authors, "State of the Union" was concerned with a man selected by the Republican Party as its torch-bearer in the 1948 presidential campaign. Beset by conniving politicians and an opportunistic female publisher, Grant Matthews, as he was called, succeeded in steering a clear path through his basic honesty and the intelligent thinking of his loyal but neglected wife, Mary. Producer Leland Hayward and the Messrs. Lindsay and Crouse called upon an imposing cast to enact the leading roles. Ralph Bellamy and Ruth Hussey, both of the film capital, appeared as Matthews and Mary, respectively and both performances brought about the highest critical praise. In the supporting cast, Minor Watson as a shrewd politician, Myron McCormick as a high-pressure publicity man, and Kay Johnson as the other woman, were right in line with the fine performances of the stars.

The play was directed by Bretaigne Windust and was high up on the list of favored plays by Dec. 31, 1945.

Hard on the heels of "State of the Union" came Elmer Rice's bright imaginative comedy "Dream Girl." This represented the famous playwright in a far lighter vein than anything he had done in several years, and was an instant favorite with both press and public. Spinning around an unhappy young lady of 23 who is dissatisfied with a humdrum existence as proprietress of a bookstore, the play presented a series of dreams undergone by the heroine in a 24-hour period and which finally culminates in her finding romance and happiness. Produced by The Playwrights Company and staged by the author, "Dream Girl" provided Betty Field with her most important role in the theatre to date. Miss Field, always a good actress, gave a bright and sparkling performance and was well supported by Wendell Corey as boyfriend and Evelyn Varden as her mother.

Tennessee Williams, author of "The Glass Menagerie," collaborated with Donald Windham in penning "You Touched Me!" a pleasant, if somewhat minor, romantic comedy. The new work was not as well received as the former, but taken with certain reservations, "You Touched Me!" gave the season a much-needed lift. In telling the story of a rum-sodden old sea captain who conspired to free his daughter from a life of frustration, Williams and Windham wisely called upon the services of Edmund Gwenn who, in the pivotal role of the marooned mariner, gave one of the best performances in a long and honorable career. As his acid-tongued sister, Catherine Willard sparked the comedy with many of its best moments. Montgomery Clift was good as the juvenile, though Marianne Stewart suffered from having been wretchedly miscast as the captain's daughter.

William McCleery's "Hope for the Best" was a talkative but frequently amusing vehicle for the starring talents of Franchot Tone and Jane Wyatt. Philip Barry, under the banner of the Theater Guild, contributed "Foolish Notion," which gave Tallulah Bankhead one of her less amusing comedy jaunts. Vincent Lawrence submitted "The Overtons," a thin domestic comedy with Arlene Francis and Jack Whiting in the leading roles.

S. N. Behrman and John Van Druten, two of comedy's leading craftsmen, were both active this season. Behrman wrote "Dunnigan's Daughter," which the Theatre Guild produced with June Havoc, Luther Adler, and Dennis King in the top roles. Van Druten, who had both "The Voice of the Turtle" and "I Remember Mama" still playing to packed houses, sent along "The Mermaids Singing." Reaction to both plays was hardly favorable, the majority of the critics feeling that both gentlemen were resting on their laurels. Both attractions, however, were still running at the end of the year.

MUSICALS

Enthusiasts of the musical comedy found themselves with a slim list to choose from during 1945. Old-time favorites like "Oklahoma!," "On the Town," and "Song of Norway" still were delighting the playgoing public, but while the year produced a wide selection of musicals, there were relatively few that won critical bravos. The Theatre Guild, sponsors of "Oklahoma!," turned its attention to Ferenc Molnar's "Liliom" and converted it into a charming musical titled "Carousel." Comparison was inevitable, as Oscar Hammerstein II, Richard Rodgers, and Agnes de Mille, who had brought about "Oklahoma!," had all lent their talents to "Carousel." The comparison proved highly favorable. Rodgers and Hammerstein once again were in charge of the book and lyrics; and Miss de Mille once more fashioned the ballets. With a company headed by Jan Clayton and John Raitt, "Carousel" became an immediate hit and was the top new musical in New York at the end of the year.

In the field of pure musical comedy, the Richard Kollmar-James Gardiner production of "Are You With It?" won hands down. Concerned with the plight of a statisician whose career was jeopardized by a misplaced decimal point, "Are You With It?" took that unhappy young man into the rank and file of a traveling carnival show where he found love, happiness, and an abundance of pleasant music. Edward Reveaux's direction embraced a cast headed by Johnny Downs, Joan Roberts, Lew Parker, and Dolores Gray. The book was written by Sam Perrin and George Balzer and was adapted from the George Malcolm-Smith novel, *Slightly Perfect*.

Paul Feigay and Oliver Smith, remembered for 1944's refreshing "On the Town," came together again this season. The finished product was a musical comedy of the Roaring Twenties, "Billion Dollar Baby," with Joan McCracken and Mitzi Green in the leads. John C. Wilson, impresario of "Bloomer Girl," staged "The Day before Spring," which contained a book by Alan Jay Lerner with John Archer and Irene Manning, of the film capital, as the stars. Neither "Billion Dollar Baby" nor "The Day before Spring" won completely favorable notices, but both musicals were expecting moderately successful runs.

The year's other musical attractions did not fare so well. Two modern adaptations of the Gilbert and Sullivan operetta "H.M.S. Pinafore" were both running for a time in two different theatres. "Memphis Bound" was an all-Negro version of the classic prepared by Albert Barker and Sally Benson. The second, called "Hollywood Pinafore," was the work of George S. Kaufman. "Memphis Bound" had Bill Robinson and Avon Long as its featured performers, while "Hollywood Pinafore" boasted the celebrated team of Victor Moore and William Gaxton. Both were lavish productions which held much initial promise, but the tides of fortune were against them, and "Memphis Bound" and "Hollywood Pinafore" closed after short engagements.

For the rest, the season brought forth "Carib Song," another all-Negro entertainment featuring Katherine Dunham and her troupe; "The Girl From Nantucket," a costly fiasco produced by Henry Adrian and featuring Jane Kean and Jack Durant; "The Firebrand of Florence," a musical play by Edwin Justus Mayer and Ira Gershwin, with Melville Cooper; and Clayton Ashley's "A Lady Says Yes" with film star, Carole Landis, in the top role.

OPERETTA

The operetta season was one of the more unrewarding features of the year's legitimate activities. The trend, generally, was toward a rather weird mixture of history and music, most of the authors being not too expert on the former. The life and times of Poland's Kosciusko formed the background of "Polonaise," which brought Jan Kiepura and Marta Eggerth back to Broadway after a successful stint in "The Merry Widow." This contained a score by no less a personage than Frederic Chopin, and, while critical response was not enthusiastic, the production managed to eke out a run of more than 100 performances. The tragedy at Mayerling, in which the colorful Archduke Rudolph of Hapsburg and Marie Vetsera were the principal figures, was turned into an elaborate musical show under the title of "Marinka." Joan Roberts and Harry Stockwell played the historic roles, and Romo Vincent and Luba Malina headed the supporting cast. "Marinka," too, was not a favorite with the press but, like "Polonaise," was able to get safely past the 100-mark before closing. The third operetta of the season was "Mr. Strauss Goes to Boston," which purported to show what happened when the Waltz King made a pilgrimage to these shores in the late 1880's. Virginia MacWatters in the chief singing and acting role waltzed away with whatever honors were to be found in the piece, but Strauss' visit to Boston was curtailed by an early closing.

VAUDEVILLE

Vaudeville remained the forgotten art during 1945, despite two attempts at resuscitation. The first was a minor variety show labeled "Blue Holiday." Presented by Irvin Shapiro and Doris Cole, with Ethel Waters as its stellar attraction, the offering closed after a few performances. Billy Rose was responsible for "Concert Varieties," an elaborate welding of various performers in the vaudeville and concert fields. Although the cast had such headliners as Katherine Dunham and her dancers, Zero Mostel and Rosario and Antonio, the show failed to win support and closed after a four-week stay.

REVIVALS

The theatre played host throughout the year to a flock of excellent revivals. Topping the list was the Michael Todd production of Shakespeare's "Hamlet" which brought Maurice Evans back to New York in his version of the classic with which he had entertained servicemen abroad. Evans' performance in the title role was a somewhat different interpretation than that usually given to Shakespeare's melancholy Dane, but one which was well received by the critics. The production was well directed and handsomely staged with Lili Darvas, Frances Reid, and Thomas Gomez supporting the star.

Hunt Stromberg, Jr. and Paul Stone were responsible for the revival of "The Red Mill," that favorite of a by-gone era. The musical opened with a minimum of fanfare and rapidly became one of the town's most sought-after attractions. Although some parts of the book had been touched up in spots, most of "The Red Mill" remained as it was originally played back in 1906. This meant, too, that Victor Herbert's appealing musical score had been allowed to remain intact. The cast was peopled with such personalities as the screen's Michael O'Shea, Dorothy Stone, and Eddie Foy, Jr., the latter running away with most of the critics' pet adjectives. Response at the box-office tills was so great that "The Red Mill," though planned originally as an eight-week affair, was confident of running well into 1946.

George Bernard Shaw's "Pygmalion," the story of a professor of phonetics and a guttersnipe transformed into a great lady, also was successfully revived. As produced by Theatre Inc., the celebrated comedy boasted the services of Gertrude Lawrence, Raymond Massey, and Melville Cooper in the leading roles, and was directed by Sir Cedric Hardwicke. Following the trend of the year's other revivals, "Pygmalion," too, was a favorite with the critics and with the paying customer.

Margaret Webster's interpretation of Shakespeare's "The Tempest" was yet another classic to provide theatregoers with a highly satisfactory evening. Always a difficult play to stage and never regarded as the Bard's most popular piece of writing, "The Tempest," as produced by Cheryl Crawford, chalked up an engagement of 100 performances, the longest run in the play's history. Vera Zorina and Canada Lee were selected for the roles of Ariel and Caliban, respectively. Combined with Arnold Moss, they gave an excellent reading of the principal roles.

Revivals also held sway in the precincts of the New York City Center of Music and Drama. During the course of the year, five legitimate attractions appeared at the house. "You Can't Take It with You," with Fred Stone appearing in the leading role of the George S. Kaufman-Moss Hart comedy, headed the list. Then came the Billy Rose all-Negro version of "Carmen Jones," followed by the Margaret Webster productions of "Othello" and "The Tempest," both of which had successful Broadway runs at earlier dates. As its final dramatic attraction for the year, the Center brought forth its annual Christmas presentation of "Little Women," dramatized by Marian de Forest from the Louisa May Alcott novel.

MELODRAMAS

With the departure of "Angel Street," the theatre found itself waiting for another good blood-and-thunder melodrama. It waited in vain, for the theatrical season produced a string of curiously undistinguished melodramatic offerings. Thomas Job, Author of the exciting "Uncle Harry" of a few years back, wrote "Therese," an adaptation of the Emile Zola novel, *Therese Racquin.* This had Eve Le Gallienne, Victor Jory, and Dame May Whitty, in addition to the directorial services of Margaret Webster. The three stars worked hard, but the play, a study of lust, murder, and revenge, failed them. It closed on the final night of the year after 96 showings.

Fay Bainter returned to the stage after an absence of almost a dozen years in a play by Mary Chase, author of last year's "Harvey." "The Next-Half Hour," as it was called, bore all the worst features of an author's earlier work and suffered accordingly at the hands of the critics. Miss Bainter's performance as a superstitious Irish mother was a good one, but the play was withdrawn after eight performances.

Robert Turney's "The Secret Room" was a fairly exciting melodrama in which an insane refugee pianist finds refuge in the home of an American doctor and his family. Elenora Mendelssohn, in the role of the villainess, walked away with the play's acting honors, and Frances Dee of the cinema made her Broadway stage debut herein. Edmund Goulding's "The Ryan Girl" was a routine penny-dreadful which ran for a while thanks to the drawing power of Edmund Lowe and June Havoc who were its stars.

The remainder of the year's sinister theatrical items included such mishaps as Irwin Shaw's "The Assassin"; Elizabeth MacFadden's "Signature!"; "A Boy Who Lived Twice" by Leslie Floyd Egbert and Gertrude Ogden Tubby; and "Rebecca" by Daphne du Maurier, this being a stage version of the successful novel with Diana Barrymore and Florence Reed appearing as the harried mistress and malevolent housekeeper of Manderley, respectively.

MISCELLANEOUS SHOWS

No theatrical year would be complete without the customary crop of miscellaneous offerings. Some of them lingered for a bit, but the majority made a quick and well-deserved detour to the storehouse. Among the fiascos of the season, there were such varied products as "One-Man Show" by Ruth Goodman and Augustus Goetz with Constance Cummings and Frank Conroy; "A Goose For the Gander" by Harold J. Kennedy with Conrad Nagel and Gloria Swanson; "Happily Ever After," by Donald Kirkley and Howard Burman, with Gene and Kathleen Lockhart; "Many Happy Returns" by Clare Kummer with Neil Hamilton and Mary Astor; "Oh, Brother!," by Jacques Deval with Hugh Herbert and Arlene Whelan; "Calico Wedding" by Sheridan Gibney, with Grete Mosheim and William Post, Jr.; "It's A Gift" by Curt Goetz and Dorian Otvos with Goetz and Valerie Van Martens; "Lady In Danger" by Max Afford and Alexander Kirkland, with Clarence Derwent and Vickie Cummings; "Beggars Are Coming to Town" by Theodore Reeves, with Paul Kelley and Dorothy Comingore; "The Stranger" by Leslie Reade, with Eduard Franz and Eugene Sigaloff; "A Place of Our Own" by Elliot Nugent, with his father, J. C. Nugent in the leading role; "A Sound of Hunting" by Harry Brown, with Sam Levene in the lead; and "Brighten the Corner," by John Cecil Holm, with Lenore Lonergan and Charles Butterworth. George Kelly dashed off "The Deep Mrs. Sykes" after a long absence from the theatre but this, too, was a failure despite the presence of Catherine Willard and Jean Dixon in the cast.

CENSORSHIP

License Commissioner Paul Moss again made theatrical news in 1945 when he ordered the closing of the controversial Howard and Dorothy Baker play "Trio." The drama was forced to end its engagement at the Belasco Theatre when Commissioner Moss refused to renew the license of the playhouse as long as the drama remained there. "Trio," which dealt with the abnormal relations of a middle-aged female French professor and her young protegee, was said to have aroused the ire of several religious organizations. The Commissioner's action was followed by a storm of protest from theatrical groups which branded the move as a "misuse of a city official's power." When Mayor La Guardia sanctioned the Commissioner's action, Playwright Elmer Rice resigned from the board of the New York City Center of Music and Drama, of which Moss was a member. "Trio," which stemmed from Miss Baker's novel of the same name, opened in New York on Dec. 29, 1944, with a cast headed by Lydia St. Clair, a continental star, and Richard Widmark. Produced by Lee Sabinson and directed by Bretaigne Windust, it had been performed 67 times when it was forced to withdraw. "Trio," like "The Captive," had become another cause celebre.

MOTION PICTURES

By Thomas M. Pryor

Motion Picture Department, *The New York Times*

GENERAL

Except for the happy jingle at the box-office, the year 1945 presented the motion picture industry with a succession of unhappy developments. Labor strife sent picture budgets soaring and indirectly contributed to the noticeable decline in both the quality and quantity of films produced; the Government reopened its seven-year old anti-trust suit to divest the major producing and distributing companies of their theatre holdings; and, in general, the coming of peace served only to remind Hollywood that its day of uncontested leadership in the world's film markets was rapidly drawing to a close. Even the box-office at home showed signs of dropping off from the dizzy heights reached in the last two war years, though as the year ended the descent had not yet reached alarming proportions.

The shifting of populations from industrial war boom sections was responsible for a sharp decline in picture receipts in certain areas, but more significant was the fact that this all-important barometer fluctuated even in large cities like New York, which did not lose any appreciable number of residents because of closing war plants. This was taken by the wiser minds in the industry as an indication that the public is gradually losing its "anything-goes" attitude of the past four years and now is starting once again to shop around for movie entertainment.

During the past 12 months the number of really good pictures was considerably below the standard of the two previous years. The reason for this decline is not easy to detect, though most of the pictures which failed to impress showed evidence of having been thoughtlessly assembled. Perhaps the film makers, like everyone else, were too intent upon following the climactic phases of the Second World War to achieve that degree of thoughtful craftsmanship necessary to lift a picture from the "good" into the "excellent" category.

Generally the producers attempted to avoid serious subjects. The slogan appeared to be "escapism and laughs for the public," yet there were a few distinguished offerings such as "The Story of G. I. Joe," "Spellbound," "The Lost Weekend" and "A Tree Grows in Brooklyn." Several pictures contained heartening evidence of a rational approach to life. This was achieved chiefly through use of the documentary technique in story presentation, two notable instances being "The Story of G. I. Joe" and "The House on Ninety-second Street."

THE TEN BEST PICTURES

Significantly both these films found a place among the year's Ten Best. As selected by *The New York Times* the choice ten were:

"A Tree Grows in Brooklyn," written by the late Tess Slesinger and Frank Davis from the novel by Betty Smith, directed by Elia Kazan, and produced by Twentieth Century-Fox. A deeply human and understanding story of a sensitive child of the slums and of her tender relations with her parents, played beautifully by Peggy Ann Garner, James Dunn, and Dorothy McGuire.

"The Way Ahead," written by Eric Ambler and Peter Ustinov, directed by Carol Reed, and produced in England by Two Cities. A crisp and meaningful history of a squad of British Army infantrymen, from the time they enter training until they go forth on their final assault in North Africa. David Niven, Raymond Huntley, and Billy Hartnell were distinguished in the cast.

"Anchors Aweigh," written by Isobel Lennart from a story by Natalie Marcin, directed by George Sidney, and produced by Joe Pasternak for Metro-Goldwyn-Mayer. A truly gay and inventive musical—the only genuinely "escapist" picture in this lot—in which the elements of light screen entertainment were artfully and tastefully combined. Gene Kelly, Frank Sinatra, Kathryn Grayson, and José Iturbi shone.

"Pride of the Marines," written by Albert Maltz and Marvin Borowsky from a report by Roger Butterfield, directed by Delmar Daves, and produced by Jerry Wald for Warner Brothers. The story of Sgt. Al Schmid, a blinded hero of Guadalcanal, impressively re-enacted in a straight realistic style by John Garfield, Dane Clark, Eleanor Parker, and a generally excellent cast.

"The House on Ninety-second Street," written by Charles G. Booth, Barre Lyndon, and John Monks Jr., directed by Henry Hathaway, and produced by Louis de Rochemont for Twentieth Century-Fox. An intriguing and exciting real-life drama of the Federal Bureau of Investigation's war on Nazi spies, based on FBI records and played convincingly by Lloyd Nolan, William Eythe, Gene Lockhart, and Leo G. Carroll.

"Story of G. I. Joe," written by Leopold Atlas, Guy Endore, and Philip Stevenson, based on the war reports of Ernie Pyle, directed by William A. Wellman, and produced by Lester Cowan. The personalized story of a group of American Army infantrymen, filmed with humor and poignancy and angled in a strictly subjective vein. Freddie Steele, Robert Mitchum, and Burgess Meredith headed the excellent cast.

"Spellbound," written by Ben Hecht from a novel by Francis Beeding, directed by Alfred Hitchcock, and produced by David O. Selznick. A free but fascinating account of a lady psychiatrist's success in delving into the mind of an amnesiac and proving him innocent of suspected homicide. Done with fine suspense and romantic illusion, and played expertly by Ingrid Bergman, Gregory Peck, Michael Chekov, and others.

"The Last Chance," written by Richard Schweizer, directed by Leopold Lindtberg, and produced in Switzerland by Lazar Wechsler. A strikingly realistic picture of a foot journey over the Alps by an American and a British prisoner of war and a group of refugees fleeing from Italy to Switzerland. Notable in a cast of impressive performers, some of them amateurs, should be cited Sgt. Penrose Reagan and John Hoy.

"The Lost Weekend," written by Charles Brackett and Billy Wilder, from the novel by Charles R. Jackson, directed by Wilder and produced by Brackett for Paramount. An unmercifully candid, shocking, and deeply poignant study of a dipsomaniac, done in the best and truest style of cinema realism. Ray Milland rates top honors for a shattering performance in the principal role, with mention also deserved by Howard da Silva, Jane Wyman, and Frank Faylen.

"They Were Expendable," written by Frank Wead from the report by

William L. White, directed by John Ford for Metro-Goldwyn-Mayer. An exciting and nostalgic story of Navy men who fought in the tiny PT-boats in the rearguard action around the Philippines in the first months of the war. Played stoutly and with plenty of rugged sentiment by Robert Montgomery, John Wayne, Ward Bond, Donna Reed, and a solid cast.

WAR THEMES

In factually reporting the war, both in Europe and the Pacific, the Army and the Navy, working in a few instances hand-in-glove with Hollywood film studios, contributed several magnificent and significant movies. Outstanding were "The True Glory," the Anglo-American account of the British and United States armies, campaign in western Europe, and "The Fighting Lady," a furiously realistic account of carrier warfare in the Pacific. The latter was edited by Louis de Rochemont, the Twentieth Century-Fox producer, from battle footage photographed by Navy camera crews. The services also broke into commercial theatres on a large scale with several thrilling short subjects, notably the taking of Iwo Jima.

NEWSREELS

The newsreels, taking material photographed by the Army Signal Corps, turned out some of the most shocking and revealing accounts of Nazi barbarism in the prisoner-of-war and concentration camps in Europe, and the wanton devastation of the Philippines by the rampaging Japanese forces. A few squeamish theatre owners either refused to exhibit these newsreels or censored them unmercifully, explaining that they did not want to risk offending the sensibilities of patrons. However, public interest in these important newsreels was unusually keen, and it is said that many citizens who had up to then looked suspiciously upon tales of Nazi barbarism as propaganda came away firmly convinced that the Nazis' brutality had not been overstated.

STUDIO STRIKES

For the first time in almost a decade the motion picture studios were involved in violent and prolonged labor strikes. This time the studios were in the middle, as the dispute arose over a jurisdictional struggle between two American Federation of Labor Unions, the Conference of Studio Unions, and the International Alliance of Theatrical Stage Employees, to gain control of the independent set designers' union with a membership of 77. The strike of set designers started in March, and several times during its duration of eight months there were threats of a general strike throughout the industry. The strike finally ended in October after several days of violence, mostly at the Warner Brothers studios, when the Painters Union won a bargaining election.

It was unofficially estimated by studio representatives that the strike cost the producing companies more than $5,000,000 in time lost. Moreover, it was alleged that the strike was partly responsible both for the reduction in the total of pictures made in 1945 and the off-quality of most of the product. Several big pictures planned for production in 1945 were postponed because of difficulties in set construction and the uncertainty as to whether a picture once started could be finished. Producers rushed pictures to completion in the fastest possible time, according to report, though, in fairness, it must be noted that there was no way of checking this with any degree of accuracy. Production figures for 1945 totaled 350 features as against 432 the previous year, 397 in 1943, and 518 in 1942.

PRODUCTION FACTORS

Another factor which contributed to the reduced production schedules was the large backlogs of completed pictures accumulated at most studios owing to the exceptionally long-runs many pictures enjoyed at first-run theatres. It is estimated that Hollywood entered upon 1946 with a reserve of completed and unreleased pictures representing an investment of $125,000,000. Indications are that production schedules will increase sharply in 1946, as several of the major companies have announced plans to resume the production of "B" pictures to keep the double-bill houses going.

EMERGENCE OF NEW STARS

Little new talent came to the fore in the past 12 months, but several players who had been doing bit or small featured roles for the last few years suddenly emerged as stars in 1945. Among the most promising were Gregory Peck, Cornel Wilde, Dane Clark, Phyllis Thaxter, June Allyson, Yvonne De Carlo, Lucille Bremmer, Robert Mitchum, Freddie Steele; and, in the younger age brackets, Peggy Ann Garner, Stanley Clements, and Conrad Janis. Two old favorites, Joan Crawford and James Dunn, returned to the screen amid well-earned acclaim. In a way the year's biggest surprise was the metamorphosis of Dick Powell from a crooner into a Bogart-type tough. Powell demonstrated unsuspected acting talents by his performances in "Murder, My Sweet" and "Cornered."

FILM FAVORITES

With two exceptions, it was the seasoned performers who once again took honors as the ten top money-making stars of 1945 in the poll conducted by the trade journal, *Motion Picture Herald,* among the nation's theatre owners. The top ten, in order of votes received, were Bing Crosby, Van Johnson, Greer Garson, Betty Grable, Spencer Tracy, Humphrey Bogart, and Gary Cooper (the only ones who tied since the poll was first taken 14 years ago), Bob Hope, Judy Garland, Margaret O'Brien, and Roy Rogers. The newcomers are Van Johnson, whose popularity among the "bobby-sox" set was the talk of 1945; diminutive Margaret O'Brien and Rogers, the cowboy king. Rogers is the third Western star to be placed among the top ten stars, that honor having previously been held by the late Will Rogers and Gene Autry. Roy Rogers, in the poll to determine the top ten in the Western Division, took first place. The other nine, according to votes received, were George (Gabby) Hayes, William Boyd, Bill Elliott, Smiley Burnette, Johnny Mack Brown, Charles Starrett, Red Barry, Tex Ritter, and Rod Cameron.

NEW LEADERSHIP IN THE FILM INDUSTRY

The most important inter-industry development of the year was the resignation in October of Will H. Hays as president of the Motion Picture Producers and Distributors of America, Inc., which he had headed since its formation 23 years ago. Hays was succeeded by Eric A. Johnston, president of the United States Chamber of Commerce, who has set about reorganizing the producers organization. His first step in this direction was the consolidation of the New York and Hollywood branches of the MPPDA under a new corporate identity, to wit, The Motion Picture Association of America, Inc. Byron Price, former Associated Press executive and wartime Director of Censorship, joined the new MPAA as a vice-president and will direct the organization's affairs on the West Coast.

Still another important personage from the business world who became affiliated with the movie industry in 1945 was Donald M. Nelson, the former War Production Board director, who accepted the presidency of the Society of Independent Motion Picture Producers.

FOREIGN MARKETS

In its initial bid to recapture foreign markets lost during the war years, the American motion picture industry encountered actual and potential threats to its economic future abroad. No new American films have been sent to France since that country's liberation as a direct result of the new government's attempts drastically to cut import licenses for Hollywood pictures. The French industry, which prospered under Nazi occupation, is jealous of the gains it made and does not like the idea of renewed large scale competition from American films.

Under the Franco-American trade pact of 1936, American films were guaranteed a minimum of 150 of the 180 import licenses granted annually to foreign films. Since this agreement was never formally denounced by either country, the American industry has refused to accept the new regulations which would limit Hollywood films to about 60 per year. Moreover, the French propose stringent new taxes, including a special tax of 50 per cent on earnings remitted to the United States. This tax is used to subsidize the export of French movies.

Several other countries also proposed measures that would severly restrict the circulation of American films, but this situation is in a state of flux, and there is no telling from day-to-day just what the circumstances may be. However, the American industry is most seriously concerned over the hostility expressed on the British radio and in the press against American films. Hollywood's films were severly criticized and derided following V-E Day, and as 1945 drew to a close, there were hot debates in Parliament on the subject of American film earnings.

British film producers, most of whom are financed by the sprawling movie interests of J. Arthur Rank, the millionaire flour miller, are bent on crashing the American market on an enlarged scale. Rank spearheaded this movement in 1945 by the formation of two new distribution companies of Anglo-American complexion and by making producing-releasing deals with Hollywood producers. He formed the United World Pictures Company in association with Universal Pictures Corporation and International Pictures, an independent firm owned by Leo Spitz and William Goetz, and Rank also joined forces with Pathe Industries here for the creation of a second distribution-production firm, Eagle Lion Films. Moreover, he made a deal with David O. Selznick for the production of pictures in England and a similar arrangement with RKO Radio Pictures. In addition, Rank has deals pending with several independent American producing firms, such as Hal Wallis Productions, to make other pictures in England.

DIVISION XXVII

EDUCATION

ELEMENTARY EDUCATION

By Wilma Leslie Garnett*
Associate Professor, Kent State University

GENERAL

"We plan" may well be called the theme of the 1944-1945 educational program at the elementary level in the United States, for even before the war had ended, school leaders were prognosticating about futures in elementary education and about demands that may be made upon that education. Plans well made should be based upon careful appraisals of stock in hand. Many schools are making such appraisals. Appraise—plan: these are the key words in reference to the present intermediate state in elementary education. In these keys is implied the idea of transition to a new order.

Schools, especially at the elementary level, face their greatest challenge. Still disjointed from the war, they must get into a period of readjustment. The biggest problems are those of getting the children who have been moving about our country with parents engaged in war service back to their home communities and finding good teachers—well educated teachers—to guide them. A school is the institution existent where two minds meet, the mind of a pupil and the mind of his teacher, inter-inspirationally concerned.

At this point of teaching, every child should learn to use his own language; should gain a command of basic arithmetic; should learn much about the social traditions and about his environment; should learn how to take care of his physical health; and should understand himself as a spiritual being with creative potentialities. The coming elementary education places its emphasis on spiritual values and recognizes the fact that these values are somewhat conditioned by the physical world. In short, the understanding and use of the basic humanities and sciences are of paramount importance. Teachers who recognize the basic issues are asking for a definition and an outline of basic essentials in the educational program at the elementary level. There is evidence that the old war between progressive and conservative camps of educationists has been dropped to give place to an interest in the two new points of emphasis for elementary education—the basic humanities and the basic sciences.

SCHOOL-COMMUNITY COOPERATION

More cooperation between the community and the school will be imperative among all agencies of educational intention—schools, churches, courts, movies, radio, libraries, and business institutions. These institutions are being drawn together in the forward-looking communities to work in the interest of children. In some cities, neighborhood schools are the order of the day. Parents are not only allowed to help but are asked to do so, and school camps as summer extensions of the programs are in focus.

---

* The author gratefully acknowledges the assistance of Agnes and Margaret Sawyer in the preparation of this review.

SCHOOL SUPPORT

If schools are to meet the present demands for education at the elementary level, support of adequate nature must be forthcoming. An October 1945 report from the National Education Association gives these points in summary relative to school support:

"This bulletin has stated that in the nation as a whole the schools have never received a large enough share of public funds or of the income of the people to enable them to function with maximum effectiveness. Studies made by the NEA Research Division and others have shown repeatedly that this is true. Past experience and current predictions of future economic trends and levels suggest, however, that a substantial increase in the public-school budget of the nation can be reasonably expected in the years after the war.

"Bearing out the above assertion, facts brought out in Sections II-V of this bulletin are as follows:

"1. The general long-time trend of public elementary- and secondary-school expenditures is upward (Section II). Thruout a period of seventy years this upward trend was interrupted only twice prior to World War II; once in the depression period following the Civil War and once in the depression following World War I. School expenditures declined in the early years of World War II, but this was presumably only another brief interruption of the general upward trend. Thruout the three years between 1940 and 1943 the total amount of the decline was only about 2 percent. We do not yet know how much was spent for public schools in 1944, but on the basis of our knowledge concerning recent changes in teachers' salaries, it seems probable that the curve of school expenditures again turned upward.

"There is no reason to believe that the curve of school expenditures will reverse its direction in postwar years. School expenditures rose steeply following both the Civil War and World War I. In the absence of any indications to the contrary, it seems logical to assume that the upward trend of school expenditures which, with three brief interruptions, has remained unbroken for seventy years will continue.

"2. Aggregate payments for teachers' salaries increased about 7 percent between 1939-40 and 1942-43 (Section II). The average annual salary of teachers increased 11 percent during the same period. This compares with an increase of almost 65 percent in the average annual earnings of factory workers, and an increase of 56 percent in the average annual earnings of all employees.

"It is estimated that the average salary of teachers increased still further, by about 11 percent between 1943 and 1945, or almost 24 percent between 1940 and 1945. Even if this is true, the rise in teachers' salaries still lags behind the rise in the cost of living, and far behind the rise in the wages of other occupational groups.

"3. Estimates of the amount needed to finance a satisfactory system of public elementary and secondary education in postwar years range from just under 3 billion dollars to about 6 billion dollars (Section II). These are not predictions of actual postwar school expenditures but are rather estimates of the amount that the schools will need in postwar years to function most effectively. Provision of any such sums would have to be the joint responsibility of government at all three levels—federal, state, and local. The present education bill, now before the Congress, would provide for only 300 million dollars annually from federal sources. This sum added to probably state and local revenues would still yield a total of less than 3 billion dollars.

"4. In only one year has the share of public elementary and secondary schools in the national income ever exceeded 5 percent (Section III). That was in the deep depression year of 1932 when the schools as well as many other public functions were sadly underfinanced. In 1943 the share of the schools in the national income was only about 1.5 percent.

"A high national income will be needed in postwar years to provide jobs for a substantially increased labor force. Estimates of the amount of net national income needed to prevent serious unemployment vary from 100 to 178 billion dollars or more. If we should accept a rather conservative estimate of a post-war national income of 120 billion dollars at 1940 prices, a share for the public schools, proportionately no larger than that received in 1932, would yield in the neighborhood of 6 billion dollars. A 3 billion dollar expenditure for schools would require only 2.5 percent of a national income of 120 billion dollars. Most estimates of postwar net national income are higher than 120 billion dollars" (National Education Association *Research Bulletin,* Vol. XXIII. No. 3, October, 1945, pp. 84-85).

THE NEED FOR TEACHERS

The greatest educational need is that of teachers. The following quotation gives a summary of the teacher shortage problem:

"The shortage of teachers in the U. S. elementary and secondary schools will be even greater this year than last. The industrial manpower shortages have been solved, but no concerted action has been taken to provide the country with the 68,000 qualified teachers who are desperately needed.

"What are the causes for this predicament? Teaching standards are deteriorating and damage is being done to the profession which will take years to repair. Is there anything that can alleviate the situation?

"One out of every five teachers who signed up to teach for the school year of 1943-44 left the job before the year was out. Many classrooms had three, four or five teachers during the year. Teachers never were found for 7,700 classrooms which had to be closed. Most of these teachers left their jobs in order to get a living wage in some other field. The teaching profession has always been noted for low salaries. In contrast to war job pay, these salaries appear even less attractive. In 1942-43, only two states paid all of their teachers $1,200 or more; 44,000 received less than $600. No wonder a welding job at fifty dollars a week seems to make more sense.

"When State legislatures met in the winter of 1942-43, many of them voted slight increases in teacher pay. This winter, these legislatures will meet again and every conceivable type of pressure should be brought to bear upon State officials to get them to provide more substantial help. The following statistics, supplied by the U. S. Office of Education and The National Education Association should be used and reused by groups interested in the problem. Mimeograph them. See that every member of your State legislature gets a copy. Follow up with a detailed picture of conditions in your state. Here they are:

"Because of lower enrollments, 10,000 teaching positions have been eliminated since June, 1943. But teachers cannot be found to fill 8,000 other positions. For 78,000 other classrooms, men and women have been recruited who could not meet state requirements but who were willing to help out as best they could. These willing but underqualified stopgaps—retired teachers, tradesmen with teaching ability, officers' wives, and others—have been awarded war emergency certificates. The numbers of these certificates has had to be increased sixteen-fold since 1942" (Helen Fuller, "Teacher Shortages," *Progressive Education,* Vol. 22, No. 2, November 1944, p. 9).

NEED FOR FEDERAL AID TO EDUCATION

Normally this country has 850,000 teachers. At present, only 700,000 qualified teachers are at work—making the shortage of 150,000 apparent. One third of America's teachers have gone to better-paying jobs. The public school teacher is the lowest paid of all professional workers. Many bar-tenders, scrub women, and messenger boys are paid better than large numbers of teachers.

The drab picture painted in a recent number of the *Parents' Magazine* makes a strong case for Federal aid to education:

"Move out a few miles from the average city or town, into the countryside, and education's poverty is strikingly in evidence. Here you will find the drab, one-teacher school (there are still some 108,000 such schools), each with its own board of education, trying to raise its own school taxes from a few score scattered neighbors. Here you will find several million children attending school in mere shacks, using wornout, dirty textbooks, taught by teachers who may not have completed high school. They "keep school" as their colonial forebears did, drilling a few elementary facts into the children's memories without benefit of competent supervision or modern instructional aids. It is at the cross-roads, too, that the classrooms have been most frequently left teacherless as the better rural teacher moves into the city to fill the gaps left by the urban teacher taking better-paying war jobs. In their plight, many local school systems have turned to state treasuries for aid. The more wealthy states have responded generously—Ohio, for example, recently appropriated $8,000,000 to its school districts for this school year. But a score of states are simply too poor to spend any more money on their schools than they are spending now. And unhappily for the nation, the states least able to support schools have proportionately the most children to be educated.

"It is these poorer states which have turned to the Federal Government for help—producing another of education's great ferments.

"'Federal aid to education' is a phrase that has become, for some, 'devil words,' for others, a battle-cry of progress" (Nathan, Raymond and Brodinsky, B. P., "What's Next in Education?" *Parents' Magazine,* Vol. XX, No. 1, January, 1945, pp. 87-88).

THE PROBLEM OF NURSERY SCHOOLS

What can be done to extend the elementary program downward to include nursery schools still remains a question, especially with the teacher shortage as great as it is. In many states, attempts are being made to get state aid for nursery school programs with which to continue the work carried on under Lanham Funds (Federal) for the war years. When the last Federal grant to these funds is exhausted (probably by March 1, 1946), it is predicted that many states will have provided state funds as a source from which local funds may be supplemented to promote a program of education and welfare work for little children—a program as sorely needed in this country as in any other.

Problems of certification, closely tied up with salary schedules, demand attention. Research reports from the National Education Association give these facts:

"Of the forty-nine major governmental units (forty-eight states and the District of Columbia), forty-eight supplied data in answer to the original request. On the basis of the information supplied, it appears that twenty states (including the District of Columbia) *require* elementary school principals to hold a clearly defined special certificate in addition to a typical teacher's certificate. In seven other states (Arkansas, Georgia, Louisiana, North Carolina, Oregon, Pennsylvania, and West Virginia) a special principal's certificate is provided for by law but for one reason or another the certificate is not at present *mandatory.* In one additional state (Texas) a statement of approval is issued by the state accrediting committee but within the definitions of the present survey it is not considered a certificate required by law" ("State Certification of Elementary School Principals"—NEA Research Division. *The National El-*

ementary Principal, Vol. XXIV, No. 5, June, 1945, pp. 6-7).

INNOVATIONS IN SCHOOL BUILDINGS AND EQUIPMENT

Striking are the innovations in school buildings, reflecting the school-community aspect of education. Removable divisions of large sections of exterior walls make possible the opening of a classroom to the outer world. In fact, the two being made one, many grade schools will be forced by questioning childhood to study some phases of natural science. More window space, better artificial lighting, fireproof structures, sanitary walls and floors (those easily cleaned), walls cushioned against noise, arrangements for disinfection of the air, wider use of glass and plastics in building materials, modernistic designing—these are characteristic of the new building which is an essential undertaking of the immediate future. The long period of postponement in building is in itself a factor promoting the program today on a rather large scale. Not only fine schools for white children, but excellent buildings for Negro children are being erected. Some of the new schools are located in connection with housing projects. Mass models, prepared by architects, are being used to sell to the communities new building programs.

Better buildings and new activities demand furniture and machines designed to meet the new needs. Chair and table, beginning to take the place of the old school desk, even supplanting the movable desk-chair; library furniture; cafeteria equipment; shop room furniture; science room furniture and equipment; music room furnishings; sound systems for broadcasting within the school unit; radio equipment; audio-visual equipment; trucks; buses; office equipment are among the musts in the new educational demands for material things.

THE CURRICULUM

The curriculum has taken in many new activities, so many, in fact, that there will have to be a stock-taking time soon, in which on the basis of carefully made evaluations, the best of the program will be chosen and expanded. All the basic programs have been changed—health, reading, arithmetic, spelling, music, art, social studies. Activities have been added to bolster the learning by doing philosóphy, but, it must be admitted that much time is wasted on rather futile activities. Many are the educational wastes under the name of activities. Visual and auditory aids to learning are supplementing the book-learning materials. All the avenues of learning, doing, seeing, hearing, reading have been expanded, but with reading still in the lead. Very little expansion of the most important avenue of learning seems to be in evidence, the avenue of creative thinking. It appears, then, that this avenue must be given consideration in the building of the new programs if elementary education in America is not going to betray the present generation of children to those nations giving thought to creative learning. The large nation that puts creative thinking first in the minds of the present generation of elementary school children will lead the world tomorrow—rightly so. America should not fritter away the most valuable hours in her present possession—hours belonging to young children; America should conserve those precious hours by offering her children functional education in health; broad education in the sciences; education for cultured literacy through literature, grammar, geography, history, music, art, drama, and dance. An article appeared in *The New York Times* that is of great significance in the bearing upon the idea expressed herein (Oriana Atkinson, "Moscow's Children? Just Like Ours," *The New York Times Magazine,* Dec. 30, 1945, pp. 11, 18).

CREATIVE THINKING

Creative thinking should be the high goal set in all educational work in composition, music, art, drama, science, and other areas. In general, these are the specifications for the elementary education for future Americans. The evaluations of the old programs must needs take into consideration the demands of future Americans. By rash prognostication, one might assert that the program of the future should include nursery school and kindergarten, and five or six years of elementary school. The brighter and healthier children should be permitted to complete the basic elementary in five years beyond nursery school and kindergarten.

Will America's children be kept in excellent physical condition; will America's children be disciplined in worthwhile studies; will America's children be given a chance to be creative? Americans can offer the physical, mental, and creative program to assure her young citizens of their rights. Newly planned programs should give these fundamental issues functional consideration.

LEGISLATIVE TRENDS

Federal legislation in the interest of child welfare includes proposed appropriations for child care (the Pepper Bill); extension of the provisions made originally in the Lanham Act; request from the National Education Association for $300,000,000 to be used for teachers' salaries and for current expenses; requests for funds for 4H Club work; requests for funds for school lunches; and plans for FM radio stations for schools. Legislation by states shows these trends: increase of appropriations to make provisions for buildings needed and for augmented salary schedules; development of retirement and security programs; permitting married persons to teach.

Themes echoed and re-echoed in America include these: (1) Promote racial tolerance; (2) promote international understanding by teaching elementary children about the children of other lands; (3) teach the air age.

AIR AGE PROGRAM

One very interesting experimental program in teaching the air age was reported in a number of *Life Magazine* in 1944—the program for the Chattanooga public schools (Tennessee). No doubt many schools are developing such programs. No doubt many schools are developing FM radio programs for schools, as in the state of Tennessee. A few universities are offering state-wide educational programs in music, literature, art, and science for children. Notable is the program carried on in Oregon, on which the State Department of Education and the University of Oregon are cooperating. Not only public schools and teacher-education institutions, but libraries (for example the Akron Public Library) are setting up programs of culture for the young in America. There is a general trend toward cooperation among all professional community agencies for the guidance and protection of the young. Commercial institutions, including some industrial plans, some housing managements, some cinematic corporations, and some department stores are giving service.

THE TEACHING OF INTERNATIONALISM

Another significant movement is that of opening sources from which schools may get the current guidance needed in teaching internationalism. Not only the United States Office of Education, but the Treasury Department, Department of Agriculture, Department of Commerce, Pan American Union, the foreign offices in this country, the D. A. R., the Red Cross, all offer excellent service for informing those who teach and those who study. One can easily anticipate exchange of materials, translations, students, and teachers within a not too distant future, even at the elementary level.

The assurance that there will be an international office for the advancement of cultural and educational understanding reflects a most sanguine outlook in educational planning.

U. S. OFFICE OF EDUCATION SERVICE

Now there appears the announcement that the United States Office of of Education is being reorganized to give broader service than ever before to the schools. *The New York Times* carried this hopeful report of the planning already done: ". . . The Education Office is convinced that it can play a more active and vital role in American school life. With an expanded staff and with the addition of school specialists in various fields, it will be easier for the United States Office of Education to keep in touch with developments in all parts of the country. Particular stress will be placed on the elementary and secondary fields, where 25,000,000 children are enrolled. Studies, reports and surveys will be made in many areas, designed to help local communities. To a much greater extent than was formerly possible, the office will keep a finger on the pulse of America's educational trends and developments, offering guidance, direction or assistance wherever possible.

* * *

"To get an over-all picture of education in this country, the Commissioner has appointed a Citizens Federal Committee on Education. This committee, to consist of twenty-seven members from all walks of American life, will meet with the Commissioner periodically, to advise him as to national needs in education and suggest necessary projects.

"Beyond that, the United States office is to sponsor an American Education Assembly, to consist of 600 to 700 school and professional leaders, to be selected from every State in the Union. This assembly, which is to meet annually, can help bring the office and school systems everywhere closer together, Dr. Studebaker feels" (Benjamin Fine, "Education in Review," *The New York Times,* Dec. 30, 1945, p. E9).

SERVICES OF OTHER AGENCIES

The same organizations are furthering the cause of elementary education. Besides the governmental agencies, there are such professional groups as the Association for Childhood Education, the American Educational Research Association, the National Society for the Study of Education, the National Council of Teachers of English, National Education Association, and others serving childhood. Publications from these organizations and others include yearbooks, monographs, and magazines.

PUBLICATIONS

Significant among the national magazines are the *A.C.E. Journal,* the *Elementary School Journal,* the *N.E.A. Journal,* the *Elementary English Review, The Nation's Schools, Educational Administration and Supervision, School and Society.* To these may be added state journals. Among the magazines doing much to get best books before children are *The New York Times Book Review,* the *New York Herald Tribune Book Review,* the *Horn Book,* and the *Saturday Review of Literature.* The publication for children, known as *Story Parade,* is a literary venture to be highly commended.

Not many books on elementary education appeared during the year. More will appear and new textbooks will appear as soon as paper shortages are less acute. Excellent revisions of texts in spelling, reading, and language have kept many schools supplied with scientifically up-to-date guides to learning.

SUMMARY OF PROBLEMS

In conclusion, mention should be made of the types of problems with which elementary education is now confronted in the United States. Major problems are as follows:

Should the elementary-school unit be extended to include nursery school and kindergarten?

Should the present six-year elementary program be shortened to five years by eliminating non-essentials?

How may the program be reformed to include basic work in science, health, humanities, and the arts?

How can the American program be better designed to provide for creative learning?

What plan of support must America provide to assure a balanced program—combined Federal, state, and local support?

How can the standards of certification be made high enough to draw a superior teaching staff?

What changes must be made in the teacher-education program?

Can the American schools serve to promote world understanding?

SECONDARY EDUCATION

By Robert S. Gilchrist
Director, University School, Ohio State University
and
Alice Seeman
Assistant Junior Dean, College of Education, Ohio State University*

ENROLLMENT

The enrollment in public high schools for 1944-1945 was 5,715,000, a slight decrease from the enrollment for 1943-1944. Enrollment changes have varied greatly in cities of different sizes. The largest loss was in the number of boys in high schools in cities of 100,000 population and over (2.58 per cent). Summer school sessions on the high school level in 220 systems reported enrollment totaling 111,731 as compared with 95,459 in 1943, a gain of 17 per cent. The enrollment of girls exceeds that for boys.

Each June the schools have encouraged the older boys and girls to fill war-service jobs during the summer. These same schools have campaigned for the student's return to school each September. In anticipation of permanent withdrawal from school of youth who find employment during vacation, the educational round-up was started earlier in 1945.

HIGH SCHOOL VETERAN EDUCATION

Approximately two-thirds or 10,000,000 of those in the armed forces during the Second World War never graduated from high school. The "G. I. Bill of Rights" (Public Law 346) and the Federal Vocational Rehabilitation Act (Public Law 16) provide veterans with the opportunity to return to school. Although it is too soon after the war to know just how many veterans will take advantage of the opportunity, secondary schools throughout the country are making efforts to develop programs which will be effective in educating the returning veteran. Most high school educators recognize that the high school as set-up for adolescents is not prepared to meet this need; therefore, a special program must be developed. This program must satisfy both vocational and general education needs. Because the veteran is essentially an adult, many high schools are organizing special classes or providing work on an individualized basis. Since the veteran is generally anxious to proceed as rapidly as his abilities and interests will permit him, a high quality of guidance is demanded. Schools are being challenged to determine progress in terms of competencies required rather than time served; for this, the General Education Development Test is being used, as well as other standardized tests.

The responsibility for developing educational programs for veterans rests upon existing local and state educational agencies. To avoid "fly by night" schools growing up to profit

---

*The writers made extensive use of the following in collecting data for this review: *The Clearing House*, *The Bulletin of the National Association of Secondary School Principals*, *Education for Victory*, *The Journal of the National Education Association*, *School Review*.

financially from the desire of veterans to get an education, most state departments have developed plans for accrediting a school to give veteran education. In some states, Michigan for example, legislation has been passed to expedite the setting up of veteran institutes by either local schools, or schools joining together to create a veteran center to serve an area.

TEACHER SHORTAGE

The effects of the war and war conditions upon teaching personnel continued during 1945 seriously to hamper secondary schools in carrying out effective educational programs. With approximately 300,000 teachers having left the profession since Pearl Harbor, class size has been increased, and some subjects have been eliminated. Teachers who would normally have retired continue to teach. Married women have been called back to the classrooms without an adequate opportunity to re-orient themselves to the new conditions which present day schools demand that they face.

The close of the war has not meant that the teacher shortage problem is solved or even relieved. Teacher training institutions are enrolling less than 50 per cent of the number of prospective teachers who attended before the war. During the next four years, the schools will be severely handicapped by a substantially reduced supply of adequately trained college graduates.

TEACHER SALARIES

Teacher shortage is, obviously, closely related to teacher salary. The average annual salary of classroom teachers, principals, and supervisors for 1944-45 is estimated at $1,786 (National Education Association, Research Division). This amount is 23.9 per cent above the average teachers' salary for 1939-40, while estimates of the cost-of-living increase during this same period range from 25 to 35 per cent. The average salary of teachers is now at least $500 below average earnings in industry. Industrial workers had salary increases of 56 per cent during the period from 1940-1943, while teachers' salaries were increased only 11 per cent.

The picture of teachers' salaries and teacher availability is not altogether dark. There is some evidence that laymen are becoming aware of the very serious problem created by low teacher salaries. This is evidenced by such articles as "Teachers' Pay—a National Disgrace" which appeared in the *Readers' Digest*. The committee on education of the United States Chamber of Commerce has recently issued a report entitled "Education—an Investment in People." The report takes the position that education pays, thus it is an essential investment for the advance of agriculture, industry, and commerce. Conclusive proof is offered that the volume of economic activity in the various states rises or falls with the level of educational expenditure (*Journal of National Education Association*, April 1945).

SCHOOL RECRUITMENTS

A vigorous high school recruitment program, in which secondary school students have an opportunity to find out the advantages of school teaching and its possibilities for social service, is suggested by many educational leaders. More scholarships to outstanding students for their attendance at teachers' training institutions are also suggested. In fact, several writers are taking the position that America must subsidize to a greater degree its program for development of outstanding leadership in the field of social service. Some school leaders are pointing out the close relationship between the quality of teachers which a school can attract and the quality of the school curriculum. It is believed by these educators that as the school curriculum becomes less static and more life-like young people will be attracted to the field of school teaching. These administrators take the position that the school principal and superintendent must exercise leadership to help communities give the prestige rightfully owing to school teachers for the kind of work they are doing, and must allow school teachers to live in communities as normal people rather than as individuals placed on a pedestal.

THE RIGHT TO A GOOD EDUCATION

In his message to Congress on Jan. 6, 1945, President Roosevelt set forth an American economic bill of rights in which a basis of security and prosperity for all, regardless of station, race or creed, was proposed. One of the economic rights of American citizenship enumerated was the right to a good education. In his budget message on Jan. 9, the President further elaborated on his recommendation for education. He said: "The training and educational program of the Army, the Navy, and civilian agencies during this war have broadened our conception of the role that education should play in our national life. The records of selective service reveal that we have fallen far short of a suitable standard of elementary and secondary education. If a suitable standard is to be maintained in all parts of the country, the federal government must render aid where it is needed—but only where it is needed. Such financial aid should involve no interference with state and local control and administration of educational programs. It should simply make good our national obligation to all our children. This country is great enough to guarantee the right to education adequate for full citizenship."

President Roosevelt, in his budget message, recommended reorganization of the basic structure of the Office of Education to facilitate service to the states in the development of a more adequate educational program; $619,265 was recommended for expanding and strengthening the Office of Education. A complete reorganization of the basic structure of the Office was recommended in order that proper emphasis be given to all aspects of education.

FEDERAL SCHOOL AID

Increased Federal aid to public education is proposed in the House of Representatives bill number 1296 (Senate bill number 181) which was introduced in the 79th Congress by Congressmen Hill, Ranspeck, and Thomas. This bill calls for an increase of $300,000,000 per annum in Federal funds to assist the states in financing public schools. The purpose of these funds is to assist in equalizing educational opportunity and to assist the states to meet a war-created emergency in education. It is estimated that 2,000,000 children of school age are not now in school. Ten million adults 25 years of age and older are functionally illiterate according to the 1940 census. Inequalities in educational opportunity in the nation exist in a ratio based upon expenditures per classroom unit of 60 to 1. The penalty of educational and health handicaps—for the most part preventable—in the youth population has expressed itself in the rejection of more than 5,000,000 men for military service. Proponents of Federal aid legislation point out that education builds better citizens, and better citizens make a better country and a better world in which to live. They further note that states limited to their own fiscal resources would not in the forseeable future be able to afford good schools for all youth (*Journal of the National Education Association,* October 1945).

Federal aid legislation gained ground during 1945. Educational leaders made pronouncements during the year which seemed to clarify the manner in which Federal aid for education could be given to states without imposing Federal control. Both the National Council of Chief State School Officers and the Educational Policies Commission made such statements. The need of a single agency of the Federal Government to deal with the school and the obvious implication that the Office of Education should be strengthened to become this agency were pointed out. The necessity for the Federal Government to provide funds through the department of education in the various states rather than through agencies which deal directly with the local school was emphasized.

STATE PLANNING AND LEGISLATION

Because education is so largely a state responsibility in the United States, planning on a statewide basis to meet the problems of the post-war years deserves mention. In Iowa, legislative bills were submitted which proposed strengthening the county administration of schools (state funds were made available to the amount of one-fourth the total cost of public school education), reorganization of school districts within counties, and transfer of the duties of the state board for vocational education to the state board of education.

Statewide surveys of education were conducted in Florida and in Virginia. Plans for education in Maryland are reported in a bulletin entitled "A Proposed Program for Education in Maryland." Recommendations are made for smaller classes, for extending the program from 11 to 12 years, and for an enriched school program to include physical education and health, work experience, radio and adult education. In Ohio a statewide school program is being developed out of the findings and recommendations of two workshops which were conducted during the summers of 1944 and 1945. These workshops were sponsored by the state universities, the state department of education, and other educational groups. Among the desirable changes considered are extension of the school program upward at least two years beyond the twelfth grade and reorganization of school districts to insure at least 12 years of equal educational opportunities to all youth and young adults.

During 1945 the Alabama Education Association spearheaded a far-reaching legislative program. One in every eight bills introduced in the state legislature was a school proposal. Sixty-two new laws relating directly or indirectly to education were added by the 1945 session. The sum of $4,200,000 was allotted to salary increases. A statewide sickleave program was adopted. Tenure was strengthened and retirement improved. In Illinois teachers now have a $1,200 minimum salary. Legislation guarantees to small districts at least $1,200 in local taxes plus state aid, or $80 per elementary student in average daily attendance. The minimum salary of California teachers was raised to $1,800 at the 1945 session of the assembly.

During 1945 considerable thought and emphasis was given in several states to a shift from an 11-year to a 12-year school system. In 1938, 11 states had schools organized on an 11-year basis. Three-fourths of the high schools and two-thirds of the pupils in these 11 states followed the 11-year plan. In the entire nation, one-fifth of the high schools and one-eighth of the students enrolled were on the 11-year plan. The state department of education in Louisiana recently issued a bulletin to assist schools in converting from an 11-year system to a 12-year plan. The South Carolina State Department of Education published "Suggestions for the Twelve Year School System in South Carolina." Maryland, North Carolina, Texas, and Virginia are working on the changeover.

EVALUATION OF EDUCATION IN THE ARMED FORCES

Cooperative planning by the Army, Navy, American Council on Education, National Association of Secondary-School Principals, the major accrediting associations, and other professional educational groups has produced a plan for evaluating the education obtained by men in the armed forces.

The Examinations Staff of the U. S. Armed Forces Institute and the Educational Services Section of the Navy Department have produced three types of tests: end-of course tests for USAFI courses, special subject examinations, and tests of general educational development which are battery tests on both secondary and college levels.

A *Guide to the Evaluation of Edu-*

cational Experience in the Armed Forces, which has been published by the American Council on Education, describes the content of the training programs and recommends credit that might be granted by educational institutions.

The USAFI has developed an "Application for Credit for Educational Achievement During Military Service" (USAFI Form No. 47). This form lists military and educational experiences of the soldier. Upon certification by an officer the form is forwarded to the school of the soldier's choice. Upon request of the school, USAFI will administer appropriate examinations to the individual, score the tests, and report the results to the school.

A two-year investigation as to what schools and colleges can learn from Army and Navy wartime educational techniques is soon to be undertaken by the American Council on Education. The study will be under the direction of Dr. Alonzo G. Grace, commissioner of education of Connecticut, on leave of absence for this purpose. Selection, classification, and assignment procedures will be studied. Analyses of tests, testing procedures, rating scales, and evaluation techniques will be conducted. Other studies will investigate: the techniques of curriculum construction based upon job analysis; emphasis of demonstration and performance in teaching; and continuous measurement of progress; new uses of printed materials, visual and auditory aids, and school equipment; training programs for teachers of physical education and health; short-term refresher courses; and new fields for women.

GUIDANCE

While it is recognized that much of what makes up the regular program of instruction might well be termed "guidance," the volume of literature published during the year on "Guidance Programs" in secondary schools would seem to indicate that specific mention should be made of trends in this field. One significant development has been the special consideration given to the role of the various staff members in school-wide guidance programs. Descriptions of the responsibilities of school personnel, such as the one presented by Glenn E. Smith in his article, "Distribution of Duties of School Personnel in a Guidance Program," (*Education for Victory,* Jan. 20. 1945), are illustrative of the trend toward all-staff participation in guidance programs. The importance of the homeroom was noted in numerous accounts of high school programs throughout the country. Homerooms, as the core of the guidance program, with the homeroom teacher serving as the guidance "officer," assisted by a specialist or counselor, was in general the preferred form of organization.

Studies in guidance practices conducted on a statewide basis in North Carolina and Kansas indicate a significant increase in the number of high schools maintaining cumulative records, courses on occupations, and regular counseling services. San Francisco's annual evaluation of counseling and guidance revealed that pupils in both junior and senior high schools felt that counselors were most helpful when personal problems arose. Both classroom teachers and counselors indicated that guidance was more successful in preventing than it was in correcting maladjustment. The need for improved counseling procedures and the necessity for caution in giving advice about choice of a vocation were repeatedly stressed.

A heavy increase in the number of guidance aids was another important development in the year. *The Practical Handbook for Counselors,* which was originally prepared to assist counselors working in the secondary schools of New York State, was published by Science Research Associates. Its concise treatment of problems and programs in guidance makes it valuable for use both by new and experienced workers. *Frontier Thinking in Guidance,* edited by John P. Yale, with contributions by Ethel Kawin, Donald G. Paterson, Floyd W. Reeves, Carl R. Rogers, Carrol L. Shartle, Glenn E. Smith, Esther M. Lloyd-Jones, E. G. Williamson, and others presents a series of excellent summaries and projections of guidance potentialities. *Occupational Laboratory Manual for Teachers and Counselors,* by Milton E. Hahn and Arthur H. Brayfield, with its corollary student workbook, *Job Exploration Workbook,* furnishes another source of material for the regular classroom teacher working within the framework of a guidance program.

LEARNING RESOURCES AND AIDS

The impact of the war upon the schools has perhaps been most noticeable in the area of learning resources and aids. The wholesale development and widespread use of films, radio, linguaphone-type equipment for language classes, laboratory and research equipment, scientific instruments, slides, and other illustrative devices by the armed forces has already begun to have its effect upon the secondary schools. The U. S. Office of Education is now working on a plan for the equitable distribution of the surplus materials which have been earmarked by the Surplus Property Board for immediate postwar service in schools. Everything from complete health clinic to athletic equipment will be available to schools. A school board which can supply a doctor can obtain the equipment for a health clinic, including X-ray machines. Radios for every classroom in the school and sound motion-picture projectors and educational films for a school library may be obtained.

Already schools are publishing documents on methods of getting more value from classroom films. Several state-wide programs for the development of large radio script collections that may be used for classroom instruction in many fields have been organized. The California plan calls for use of wire recordings of major happenings in all fields. A television program using high school students, high school faculty members, and administrative officers of the public schools has been inaugurated in Chicago. A half-hour program is presented once each week under the title "Young Chicago."

BROADCASTING

Under a ruling of the Federal Communications Commission, a specific broadcast band has been allocated exclusively for educational frequency-modulation broadcasting. In 31 states plans have been initiated for state-wide educational networks to be operated under the guidance of state boards of education or other educational agencies. In addition to the programs being developed by state agencies, many large cities are planning similar installations for the benefit of the schools. Chicago, Cleveland, Brooklyn, and San Francisco have been experimenting with FM broadcasting during the year.

In Chicago radio programs prepared and broadcast by the Radio Council of the Board of Education are designed primarily to stimulate interest in such subjects as history, good books, geography, world neighbors, citizenship, and the arts. Twenty programs a week are broadcast from the Council's FM station WBEZ. To supplement these programs, the Chicago Radio Council distributes handbooks with suggestions as to other extra-curriculum activities to be motivated by the radio programs. The pupil reaction is excellent. Over 500 students applied for permission to enroll in the Council's Radio Workshop which trains about 40 students a year for radio careers. A daily program is broadcast throughout Kansas as a means of improving remote rural schools. Lessons are presented in social studies, science, hygiene, art, and music.

USE OF FILMS

The American Council on Education has released 33 filmstrips dealing with contemporary life in the United States. Each filmstrip is accompanied by a script which may be used as a commentary when the film is projected. These films are available for use in secondary schools.

AVIATION

Aviation education in the secondary schools seems to have taken three forms: (1) activities related to aviation which are included as part of the regular course offerings; (2) vocational training or shopwork related particularly to aeronautics such as aircraft mechanics; (3) science or aeronautics courses which ordinarily last a full academic year and are given in grades 11 and 12.

The first type of work consists merely of introducing aviation materials which are relevant to the topics being studied. Such units of work are provided in the schools of Connecticut, California, Illinois, Colorado, and Pennsylvania in regular courses, such as social studies, English, fine arts, mathematics, biology, physics, general science, and foreign language. The second type of offering seems to be confined largely to city schools. An example of this type of program is the Illinois state plan which provides for vocational training in cities where there are "bonafide CAA approved schools for training licensed aviation and engine mechanics." ("Illinois State Plan of Aviation Education." *Bulletin of the National Association of Secondary School Principals;* Dec. 1944.) The third type of program is also found chiefly in large schools.

In 1944-1945 courses in the science of aeronautics were offered in 79 schools in Connecticut, and in 194 high schools in California where 4,661 students were enrolled (*School Review,* April 1945). The Civil Aeronautics Authority reports that more than 200 high school students in Wisconsin had flight experience during the term ended June 1945. New York has a $20,000 flight experience program in operation, in which Schenectady, Rochester, Waterloo, and other schools have already participated. Pennsylvania, Illinois, California, and Connecticut are among the states which now provide for laboratory flight experience programs.

The rapid expansion of such programs in secondary schools throughout the country is indicated by the scope of numerous detailed plans such as are presented in the "Aviation Education in Secondary Schools" issue of the *Bulletin of the National Association of Secondary School Principals.* Tennessee has established a Bureau of Aeronautics which cooperates with colleges and universities in an extensive program for the training of secondary school aeronautics teachers. Four state departments (Rhode Island, Ohio, Tennessee, and Alabama) scheduled conferences to review their programs in this area and to plan next steps (*Bulletin of the National Association of Secondary School Principals,* May 1945).

MILITARY TRAINING

Throughout 1945, there was much discussion and difference of opinion among both laymen and educators concerning proposals for a national system of military training. There was agreement that a plan which would remove boys of 17 or 18 from their normal pursuits, including schooling, would have far-reaching effects on the purposes, accomplishments, and even the structure of American education. Most major organizations of educators went on record against the passage of a peacetime compulsory-service bill during wartime. Secondary school educators did not want to see a year of military service replace the final year of high school as would often have been the case if H. R. 3947 had passed. In this bill, a boy would have entered military training at the age of 17 unless he had already finished high school, in which case he would start his military training upon high school graduation.

The Secondary School Principals' Association, in conjunction with the Research Division of the National Education Association, conducted a poll on some of the issues involved in a national peacetime policy of compulsory military training for male youth. This poll of 3,750 administrators and 250 classroom teacher leaders indicates that they are not convinced that military training will give the United States the national security that military leaders claim for such a program. Eighty-one per cent of high school principals polled were opposed to all forms of compulsory military training in peacetime. The comments of the administrators repeatedly raised questions concerning the danger to our democracy in placing so much power over youth in peacetime in military agencies and pointed to the history of compulsory military training in Europe. Many suggested that the world program for security should be further developed before America should decide the military training issue.

Throughout the nation educators attempted to encourage laymen to think of military training in terms of national defense as the only valid favorable argument. Many claims have been advanced for military training, such as: improved personal health, physical fitness, education of illiterates, respect for authority and property. Most school men say that military and civilian life are so different that military discipline is not the answer for peacetime citizenship. Many educators urge that America develop more health and recreation services including psychological counseling, immunization, adequate diets for all children, and free and compulsory removal of remediable physical defects. These same educators would hope that the public school system would be so strengthened through expenditure of the amount of money necessary for military training that youth would be better prepared for either war or peace.

DENTAL CARE

Data regarding programs of health instruction in secondary schools are encouraging. The Society of State Directors of Health and Physical Education notes: "Nineteen states report that health instruction is given in the junior high school and twenty-three states report that health instruction is given in the senior high school" (*Proceedings of the Nineteenth Annual Meeting,* Society of State Directors of Health and Physical Education).

The survey of high school dental programs under way in local school systems—county systems, city systems, and individual high schools, which was conducted early in 1945 by the U. S. Office of Education revealed that: (1) many programs were curtailed by war conditions, an important factor being the shortage of dentists in the community; (2) examination of teeth of pupils is one of the fundamental emphases upon which these dental programs are built; (3) a note to parents emphasizing the importance of dental care is an almost constant feature of these programs; (4) follow-up is most frequently the responsibility of the dentist, nurse, or physical education department; (5) with few exceptions reliance for correction is placed upon dentists in private practice; (6) generally some provision is made for dental treatment of pupils whose parents are unable to pay for the needed dental work.

Special education concerning the care of the teeth is mentioned by most of the schools reported. This instruction is usually given as part of the health education program. Use is frequently made of motion pictures, film slides, charts, models, plays, puppet shows, and assembly programs. Several of the schools have developed programs of instruction for parents as well as pupils. Where the school programs have been in operation for 20 or more years, the community has often become "dental conscious".

PHYSICAL EDUCATION

Physical education as an important factor in maintaining the health of high school students has received considerable emphasis in the literature. The Society of State Directors of Health and Physical Education reports that 27 states reported having a law making physical education compulsory; five states reported that physical education was compulsory. The American Association of School Administrators, in its publication *Paths to Better Schools,* reports that requirements with regard to time allotment vary from two to five times a week, and from 60 to 300 minutes. It is further noted that, "the students in junior and senior high schools need at least sixty minutes per day of physical activity adapted to individual needs and capacities within the school program and an equal amount after school hours." It would seem apparent that many departments of education have not recognized the importance of incorporating physical education as one of the curriculum requirements for all high school students.

RECREATION

Recreation and leisure activities for adolescent youth are assuming new importance as responsibilities of the secondary schools. Recognition of the significance of first-class school programs as a major factor in preventing juvenile delinquency has led to a widespread interest in school canteens, youth centers, and after-school club activities. The extent to which such school-sponsored programs have been developed throughout the country is indicated by such an article as "School Canteen: a Flourishing Idea" by Anna M. Jones (*Clearing House,* January 1945).

The Youthbuilder clubs which are now operating in more than 150 New York City schools are another example of the type of constructive activities being provided by secondary schools. The Manhasset Youth Center, run by the Manhasset Youth Council, an organization representative of all the community young people between the ages of 14 and 18, not only provides a recreational program for youth of this age but also serves as a medium for participation in community affairs. The three types of recreational programs mentioned are representative of the general trend.

However, summer camps sponsored by P. T. A. groups, community agencies, or the schools are frequently cited as being valuable additions to well-rounded recreational programs. Statewide school-coordinated child-care recreation programs sponsored by state departments of education are also described as being one of the most effective plans. The state of Washington furnishes an excellent example of this type of program. The office of the state superintendent gives aid to local districts in planning and financing recreation programs. Emphasis is placed upon the schools making use of their facilities to the fullest capacity. The plans include such activities as hiking, fishing, dancing, music, hobby clubs, camping, outings, and athletic activities.

WORK AND SERVICE EXPERIENCES

The marked growth in school programs of part-time employment of students, which was noted during the early war years, continued during the year. Such adjustments were made in order to contribute to the war effort. By this means many schools stopped or reversed the trend toward loss of students which developed with our entry into the war. Although the major purpose of part-time employment in most high schools has been that of vocational preparation, increased recognition has been made of the many social and personal values coming to the student who accepts a part-time job. The successful Minneapolis junior-high school work program has been notable for its emphasis upon personal values of such experiences. Noticeable improvement in attitude and behavior on the part of students, who had been considered disturbing elements in the schools, has been reported by principals and administrators participating in such programs.

Typical of the trend in work-service programs is that of Los Angeles which reports a well-balanced program of school and supervised part-time work. The Board of Education reports unsuspected values in work experience through the operation of the Four-Four Plan (four hours in school and four in work each day). Students were enabled to make better decisions in vocational selection and at the same time gave evidence of having learned much about people and machinery. The success of the program was so great that it is being considered for continuation during the post-war era.

The extensive and varied provisions of such programs as that of the Philadelphia schools for employment of students in the high schools are indicative of the trend toward more elaborate work and service activities. In evaluating these programs mention is repeatedly made of the improvement in appearance, attitude toward school, and regularity of attendance which accompanied participation in work and service programs.

The treatment of work experience as a part of secondary education in such publications as *Education for All American Youth* and *Planning for American Youth* are notable illustrations of the increased emphasis upon school work programs. The *Review of Educational Research* in October 1944 carried a résumé of the literature on this subject. A number of bulletins of the National Associations of Secondary School Principals has carried articles on school work and service programs for secondary school students.

The need for evaluation of the educational worth of these programs has been stressed in such publications as *Education for Victory* (April 20, 1945). The wide variety of school-work programs ranging from closely supervised to loosely supervised and in many cases wholly unsupervised activities furnish ample evidence that there is need for further assembling of evaluative data.

WORLD UNDERSTANDING

One of the most impressive and encouraging things about American education in the past few years is the work that has been done in the fields of international and intercultural education. Two major trends have manifested themselves in this area.

One trend has been noted in the area of direct action in the schools to promote tolerance and understanding of all peoples regardless of race or religion. Boards of education in many large cities such as Newark, New York, Chicago, Detroit, Los Angeles, Pittsburgh, Philadelphia, and Boston have declared themselves in favor of intercultural programs for tolerance. State departments of education have also become interested. Established programs are in operation in four states. In West Virginia, white and Negro high school students have called and attended conferences together. In many secondary schools throughout the country teachers are using special celebrations such as Negro History Week, Brother Week, Easter and Passover, Pan-American Week, etc., to further the idea of goodwill.

The Benjamin Franklin High School in Harlem, New York City, provides another example of a secondary school which makes use of its varied school population and location in a mixed neighborhood in building a program for encouraging tolerance and understanding. Discussion groups in the various high schools of New York (150 of them) have also served to bring about better understanding of other groups of peoples. A program of visitation to churches of three faiths by history classes in the Bellingham, Wash. High School is also an example of the kind of activity now being fostered in secondary schools for the purpose of developing greater understanding and appreciation of different religious and racial groups.

The Division of Inter-American Educational Relations, U. S. Office of Education, after analyzing reports from hundreds of Pan-American Clubs in every state in the union noted the following two major developments: (1) an increasing number of clubs are establishing scholarship funds to enable members to spend more time in study in other American Republics; (2) the extension of Pan-American Day into a Pan-American Week in which much original material and new ideas for programs, exhibits, and community projects have been produced.

Perhaps the most outstanding event of the year with regard to education for world understanding was the inclusion of educational provisions in the United Nations Charter. With respect to education the charter provides:

"That the General Assembly is authorized to initiate studies, reports, and recommendations for the purpose of promoting international educational and cultural cooperation.

"That the Economic and Social Council may make or initiate studies, reports, and recommendations on education to the General Assembly, the members of the United Nations, and specialized agencies.

"That under the Trusteeship System, those of the United Nations who have or assume responsibilities for non-self governing areas accept the obligation of insuring the educational development of such peoples."

HIGHER EDUCATION

By Ralph McDonald

Executive Secretary, Department of Higher Education, National Education Association of the United States

TRANSITION FROM WAR TO PEACE

The colleges and universities during 1945 were engaged in revamping their facilities and programs from a wartime to a peacetime basis. The large universities, coeducational colleges, and colleges for men were making revisions almost as sharp as those incident to the transition to their war programs. While in the main the process was one of going back to pre-war practices, the American college in 1946 will be in many features quite changed from its 1940 mold. Colleges for women, less affected by war demands, have been likewise less altered by post-war conditions.

CULTURAL RETARDATION DURING WAR

In sharp contrast to the action of England, Russia, Canada, and other major allied nations, the United States Government—more specifically the military leadership—followed during the war a manpower policy which reduced almost to the vanishing point advanced training in the scientific, professional, and cultural fields. Selective Service policies, by 1945, had almost dried up the male enrollment in teachers colleges, dental schools, medical schools, and other professional and scientific institutions.

Results of these policies were becoming increasingly evident by the end of the war. As an illustration, more than 100,000 persons were teaching in the public schools, in December, 1945, on emergency certificates, unable to meet even minimum state requirements of teacher preparation. The nationwide shortage of dentists and physicians had likewise become acute.

A deficit of 3,000,000 student years of college education was incurred in the United States during the war period; that is, college student years completed were approximately 3,000,000 less than it is estimated would have been completed if the nation had been at peace or if manpower policies had encouraged rather than retarded higher education.

The seriousness of our cultural-scientific retardation is multiplied by the progressive emergence of a society requiring even higher levels of scientific, cultural, and technological competence.

STUDENT ENROLLMENT

Student enrollment at all levels, which declined steadily during the war years, climbed rapidly upward after August, 1945. As of Oct. 15, 1945, the total number of students in 1,554 institutions was estimated by the United States Office of Education to be 926,000, whereas the total enrollment in the same institutions in

October, 1943, was estimated to be 738,000 (*Estimated Changes in Volume of Activities in Higher Education Institutions, 1941-1945.* U. S. Office of Education Statistical Circular SRS-21.3-016). Enrollment in October, 1944, not estimated officially by the Office of Education, was less than that of October, 1943.

The increase already evident in enrollment reflects but the early stages of a large expansion in college and university registrations. The trends have taken unmistakable lines, and full-time enrollments for the year 1946-1947 are estimated to reach a figure double that of 1944-1945, the last year of the Second World War. With such an influx of students into the colleges, enrollments will soon be the largest in history. Furthermore, the trend is likely to continue for several years, ushering in what may well be considered a new era in higher education.

Several characteristics of the enlarged enrollment are noteworthy. The increases are much greater for men students, but extend also to women students. Classes are larger at all levels, from the freshman year to the graduate school. Enrollment increases are proportionately greater in graduate, pre-professional and professional courses, and in freshman classes of liberal arts colleges. The enlarged registration of foreign students, already evident during the war years, has continued, particularly from Latin American countries, China, and our allied nations. Colleges for Negroes reported increased demands for entrance beyond the average of other institutions. Increases in enrollment at teachers colleges were general, but the rebound of post-war registration has not brought these institutions as close as other colleges to their normal student population.

Enrollment increases have not been distributed proportionately among the individual colleges of the country. There has been a marked tendency of veterans to choose large and well-known universities and professional schools, while smaller colleges generally have thus far reported less striking increases owing to veteran enrollment. The Veterans Administration found that, in the autumn of 1945, of college students enrolled in more than 1,200 colleges and receiving benefits under Public Law 346, popularly known as the G. I. Bill of Rights, 43 per cent were concentrated in 42 institutions.

Chief factors accounting for the unprecedented rise in enrollments have been: (1) demobilization of the armed forces; (2) Federal subsidies through the Veterans Administration for the education of veterans; (3) reduced demand for employment of minors and youth in the nation's economic life; (4) relaxation of tensions induced by total war; (5) broadened educational programs with wider appeal to students; (6) a reassertion or perhaps even a strengthening of the general American faith in education ("How Americans rate the job colleges and universities do today, and can do in the future," *Fortune Magazine,* April, 1945). Undergirding the enlargement of higher education has been the steady growth of secondary education, with the persistent long-range increase in the number of high school graduates remaining evident as a strong national tendency despite a falling off during the war.

VETERANS IN THE COLLEGES

Spurred by Federal benefits covering subsistence as well as educational fees and supplies, veterans of the armed services have accounted for a large part, though by no means all, of the expanded college population. The number of veterans in higher education, estimated at scarcely 12,000 in January, 1945, probably exceeded 100,000 by the end of the year. As revised late in December, the educational provisions of the United States Government under Public Law 346 afford subsistence allotments of $65 per month for the veteran without dependents or $90 per month for the veteran with dependents. Subsistence benefits for disabled veterans undergoing rehabilitation training are still greater.

The subsidy policy of the Government for veterans education continues to discriminate somewhat against certain publicly supported and private low-tuition institutions for the reason that the original bill provided for Federal payments based on tuition and student fees. Adjustments made administratively by the Veterans Administration and legislatively by the Congress in recent amendments to the Serviceman's Readjustment Act reduce the inequities by establishing out-of-state tuition rates for in-state veterans, an assumed minimum tuition rate, and estimated cost of teaching supplies and personnel as elective alternate bases of Federal payments to institutions.

HOUSING IN COLLEGE COMMUNITIES

Acute shortages of housing, especially for married veterans, have developed in many college communities. While colleges had married students before the war, their numerical proportion to entire student bodies was small. Also, many pre-war married students left their families at home while attending college. Veterans, having been separated from their families for the war years, or having recently been married, desire to have their families with them. Throughout the nation it is estimated that probably 30 per cent of veterans attending college are married, and the proportion is half or more in some institutions.

Existing dormitory facilities of the colleges have proved wholly inadequate for married veterans, as have the residential facilities available off-campus. Surplus government-owned housing, made available after some delay, has helped, but the problem has become increasingly serious. For unmarried students the housing shortage has been less acute but has reached emergency proportions at some of the large institutions.

BUILDINGS AND EQUIPMENT

Little building has been done at the colleges during the war years, additions to plants being limited to the needs of the Army and Navy units. Classroom, laboratory, and library facilities at many institutions became overcrowded before the end of the year. Repairs, replacements, and improvements in existing buildings and equipment have fallen far behind normal. Thus the colleges face the period of greatest demand upon their services with plants and equipment in many instances below standards of adequacy for the load.

Initial financial provisions for plant expansion and improvement were made during 1945 for a considerable number of colleges, but in most such instances the money made available has been unspent because of the critical shortage of building materials and manpower. A case in point is Michigan State College, which had money in the bank for a considerable period before any building contractor could be induced to make a bid on the desired construction. The greater number of colleges and universities by the end of 1945 had neither the financial resources nor the available construction facilities to begin needed expansion. Contract prices where plant expansion was made during the latter part of 1945 were reported to run from 40 per cent to 70 per cent higher than pre-war building costs.

Preliminary steps toward Federal public works subsidies, the emergence of a unified housing program in the Federal Government, legislative appropriations in several states, and scattered authorizations of bond issues give promise of aid to public colleges in the matter of building. Building fund drives, memorial funds for alumni killed in the Second World War, and bond issues for self-liquidating projects are the principal sources being employed by private institutions. A vast store of surplus government property began, late in 1945, to yield a trickling stream of needed equipment items to institutions, public and private.

STAFF PROBLEMS

By Christmas, 1945, a serious shortage of instructional manpower was reported throughout the country, particularly for scientific and technological courses. The available supply of personnel and guidance specialists was quickly reduced to a point near exhaustion.

The faculty shortage was aggravated by several discernible factors: (1) slowness of demobilization of faculty members in service; (2) low output of graduate schools during war years; (3) attraction of thousands of former faculty members into government service and business employment; (4) low salaries throughout higher education; (5) housing shortage; (6) expanding services, as well as growing enrollments in colleges and universities; (7) inadequacy of security provisions, such as retirement and tenure, in many institutions; (8) lack of professional standards as to classification, compensation, and promotion in many colleges; (9) pressure of increased taxes and inflationary price trends, which was only partially offset by salary adjustments in the majority of institutions.

The shortage, growing more acute as time passes, is further complicated by the incompleteness of professional placement facilities and services at the national level.

STATEWIDE PLANNING

New impetus came in 1945 for the movement toward statewide planning and coordination of higher education programs. The United States Office of Education, Division of Higher Education, published two influential bulletins stimulating cooperactive planning (*Data for Statewide Planning of Veterans Education,* United States Office of Education Bulletin, 1945, No. 4.; *Higher Education Looks Ahead,* United States Office of Education Bulletin, 1945, No. 8). College Associations and voluntary state conferences, almost without exception, pointed the thinking of their constituent institutions toward closer coordination in postwar planning.

Higher education surveys and commission studies in Alabama, Connecticut, Illinois, Mississippi, Pennsylvania, Virginia, and West Virginia carried forward the concept of statewide integration. The Mississippi survey, completed in 1945, provides a particularly outstanding pattern for the comprehensive study of public higher education within a state.

WOMEN IN THE COLLEGES

The year 1945 witnessed further deepening of the trend noted by Prof. Alonzo F. Myers in 1944, namely, an increasing enrollment of women in colleges and universities, and an ever widening spread of women students into the various educational and vocational fields" (The American Year Book, 1944, p. 992). Coeducational institutions found women applicants to fill an increasing number of residential units left vacant by the calling of men into the armed services. On many campuses the reoccupation of men's dormitories by returned veterans resulted in considerable dislocation among the greatly increased number of women students. Women's colleges reported capacity enrollments almost everywhere for the Fall of 1945.

LESS THAN FOUR-YEAR PROGRAMS

Events of 1945 removed all doubt as to the emergence of a major trend toward higher education programs of less than four years, in addition to the regular baccalaureate courses. The closing of a considerable number of junior colleges during the war had given rise in some quarters to the belief that college programs of one, two, or three years duration might meet a decline in demand.

New York State is meeting the need for post secondary education of less than baccalaureate level by the establishment of a statewide system of technical institutes. Primarily vocational in their nature, the programs of these institutes include varying proportions of general studies. Usually the course offered is for two years.

The University of Nebraska recognized the demand for less than four-year programs, and the faculty instituted, under the administration of the General College, 29 separate and distinct vocational-cultural programs of less than four years, chiefly of two years' duration.

The trend illustrated by the New York State technical institutes and by the Nebraska General College has become manifest in numerous institutions—junior colleges, urban universities, and elsewhere.

EXTENSION OF COLLEGE SERVICES

Closely related to the expansion of less than four-year programs is the extension of college services beyond the campuses and in evening classes. The Engineering, Science, and Management War Training courses, which provided training for 1,700,000 war workers, revealed in many areas the vast possibilities of off-campus specialized courses for the general adult population. Held in abeyance by the manpower demands of total war, the demand for such courses developed to substantial size during 1945. Resulting from this demand during the latter months of the year were a growing number of extension centers, a variety of new programs offered, and a widespread increase in extension enrollment, both for credit and for non-credit courses.

The continuation of 1945 trends, which seems assured, will mean a significant spreading out of higher education services and enrollment. The wider distribution of higher education means the reaching of a much wider range of population in age, in geography, and in interest served.

RESEARCH

Revelation during 1945 of the astounding wartime discoveries in radar, atomic fission, medicine, and other fields produced an interest in scientific research far beyond that of any previous period in the nation's history.

Although clouded for the time being by an undue emphasis upon military uses and by a reluctance of military authorities to relax their wartime control and secrecy, a new era of scientific research appears to be inevitable. Bills to establish Federal Government subsidies for research, introduced in 1945, have strong support in both houses of Congress. The major issue in connection with this proposal, at the close of 1945, centered around the question of freedom of research, especially from military control and emphasis. Another important issue arose as to whether research in the social, cultural, and non-technological fields should be furthered by government subsidies to balance progress in scientific knowledge. The place of pure research, as well as research in applied science, seemed to be assured in the Federal subsidy program.

GUIDANCE

Expansion of facilities and personnel for advising and guiding students was one of the major developments in higher education during 1945. The establishment of guidance centers for veterans under the immediate direction of the Veterans Administration, together with the establishment of guidance service for veterans by universities under contract with the Veterans Administration, provided Federal support in this development.

While the primary emphasis has been upon guidance for veterans, most of the colleges have improved their advisory services for their regular students. The limited supply of professionally trained guidance experts has deterred the rate of expansion of such services.

The increased faculty time required for providing personal advisement to each student has not been matched by a commensurate increase in the number of faculty members. The burden of student advisement has, therefore, fallen as a heavy time consumer upon many faculty members already faced with full schedules. Despite the obstacles, however, guidance was fully recognized by the close of 1945 as a necessary and important specialized service of a college to its students.

CURRICULUM

The year was unusual both in the extent and in the nature of curriculum studies made. With unprecedented interest and vigor, faculties throughout the nation considered, evaluated, and revised their requirements as to curriculum.

In addition to the expansion of vocational-cultural programs of less than four years mentioned above, there was a widespread effort to clarify and re-define the nature of general education. The elective system, the measurement of education in terms of credit hours, and other accepted practices were under heavy criticism.

A notable example of curriculum study was that conducted at Harvard University. A Harvard faculty Committee on the Objectives of a General Education in a Free Society published its report in the summer of 1945 (Buck, Paul H. and others, *General Education in a Free Society,* Harvard University Press, 1945). The Committee report has received such wide publicity that President Conant, in his annual Report to the Board of Overseers, stated: "I doubt if any single volume published under Harvard auspices or written by any member of the Harvard faculty has left an impress on American education comparable to the eventual effect of this careful study" (Conant, J. B., *The President's Report, 1945,* Harvard University).

The principles laid down in the Committee report were adopted on an experimental basis in October, 1945, by the Harvard Faculty.

A summary of the new general education plan at Harvard is contained in President Conant's annual report, as follows: "Briefly, the plan envisages the development of a group of very similar alternative courses of a new type in (a) the Humanities (the courses might be called Great Texts in Literature); (b) the Social Sciences (the courses might be called Western Thought and Institutions). Eventually every undergraduate would be required to take one of these alternative courses in each of these two areas. In science there would be two to four closely related alternative courses concerned with the Principles of Physical Science and a similar group dealing with the Principles of the Biological Sciences. Eventually all students in Harvard College would be required to take one course in either the one group or the other.

"It is these new courses in the Humanities, the Social Sciences, and the Natural Sciences which it is expected will furnish 'the common core, the body of learning and of ideas which would be a common experience of all Harvard students.'

"But the new regulation as to the general part of an undergraduate's education does not stop at requiring three courses of a new type. In addition, when the plan goes into effect, the student will have to take also three further courses in general education. No one of these additional courses shall be in the student's field of concentration. The choice will be confined to the courses given by the usual departments but approved by the new Committee on General Education as fulfilling the aims of a general education" (*Ibid.,* p. 7).

President Conant further comments on the plan: "It is thus not the elective system which is modified by the recent votes of the faculty to which I have just referred; the free elective system was replaced long ago by a system of concentration and distribution here at Harvard. The new plan is rather a scheme of directed distribution. The faculty has finally decided, following the lead given by the Report of the Committee on the Objectives of a General Education, that as a basis of a general education in college one must have something more than a distribution of a quarter of one's work according to some general pattern. The essential point is that special courses are to be provided in certain specified areas. These it is hoped will answer the need we have sought here for so long to fill by experimentation with patterns of distribution. It should be noted in addition that the new plan provides for six-sixteenths of a student's time instead of a quarter being spent outside of his special field" (*Ibid.*, p. 9).

FINANCIAL CONDITION OF INSTITUTIONS

An increasing number of colleges were facing serious financial problems as 1945 began. By the end of the spring terms, many institutions were in desperate straits. Particularly hard hit were men's colleges, teachers colleges, and certain junior colleges. Heavily dependent upon student tuition and fees for income, certain of these colleges had suffered serious reductions in their receipts as the supply of men students was diverted almost entirely to the armed services and war pursuits.

Reporting upon the growing financial crisis of many colleges and universities, a special advisory committee appointed by the Committee on Education of the House of Representatives urged, in February, 1945, that Congress appropriate an annual sum of $25,000,000 as a wartime subsidy fund to replenish partially the college revenues lost through decline in enrollment (*Effect of Certain War Activities Upon Colleges and Universities,* Report from the Committee on Education, House Report No. 214, February 23, 1945).

Although studied by the House Committee, the proposal had not been acted upon when war ended.

Despite increases in receipts from student fees as a result of their enlarged enrollment, many colleges were still in serious financial condition. The continual drain on their resources during the war years left many in a weakened position. Increases in legislative appropriations to state institutions have rarely been sufficient to meet the increased price level, provide for the enlarged enrollments, and increase faculty salaries to offset inflation.

The situation at the close of 1945 was serious throughout the nation, particularly in the matter of faculty salaries. Without greater financial support to enable the payment of much more adequate salaries, a qualitative disintegration of higher education seemed likely. Increased enrollment, not accompanied by substantial augmentation of income from other sources as well as from student fees, served to intensify rather than to solve the financial problem of many institutions in which educational costs per student were far in excess of the fees collected. Even in privately supported colleges the educational cost per student averaged twice as much as the amount of tuition. In publicly supported institutions the educational cost before the war was roughly six times the average amount of student tuition.

The rapidly increasing enrollment of students, already an established trend, makes it imperative that higher education in the United States receive far greater financial support, from both private and public sources, than it has ever before received.

VOCATIONAL EDUCATION

By L. H. Dennis

Executive Secretary, American Vocational Association, Inc.

GENERAL

Termination of war training programs shortly after V-E Day, swift initiation of effective reconversion training, an appraisal of war training work and retention of those services with a permanent, peacetime value—these were the major factors affecting, and accomplishments of, vocational education during 1945.

The public vocational schools and classes trained more than 11,500,000 men and women for work essential to the war industries between 1940 and

1945. These workers were trained for the exact job requirements of specific war industries, in the numbers indicated by industry, and often within the very plants where they were to be employed following training. They were prepared to make an immediate and effective contribution to the national war effort, and that contribution stands unequaled and unchallenged by the schools of any other nation in the world.

Before V-J Day, the vocational schools were directing their efforts to their evident obligation to veterans and demobilized war workers. Guidance and occupational adjustment services, training and retraining, were clearly the next assignment. Employment, which involves employability, posed the most serious problem facing education upon cessation of actual warfare and cut-backs in the war contracts which had furnished work at high wages for many millions of Americans.

In 1929, there were approximately 47,000,000 in the national labor force—the peak figure until 1944 when it reached 65,000,000, including men in the Armed Forces (*Vocational Education in the Years Ahead,* Bulletin 234, Series No. 7, U. S. Office of Education, in process of publication). Absorption of the war-employed of these 65,000,000 into peacetime employment could not be accomplished immediately upon arrival of V-J Day, and the schools recognized their role before they were called upon to contribute to the solution of this most recent national emergency.

AGRICULTURAL INSTRUCTION

Mechanism of both agriculture and industry have made increased yields, higher levels of production, and greater output per worker possible. During the war, when farm workers were not available, American agriculture achieved its greatest production through improved farming methods and organized instruction in the construction, maintenance, and repair of farm tools and equipment. Lessons learned during the war emergency remain a factor in agricultural economics and will have a direct bearing upon the migration trend from rural to urban communities. U. S. Census reports show that in 1930, there were 3,975,769 boys and girls between the ages of 10 and 14 on the farms in the United States. Ten years later only 2,434,241 of that same group of children remained on the farms. A total of 38.77 per cent had left before they reached the age of 25 years. There is no reason to presume that the percentage will be lower for the present or in post-war years for which no statistics can yet be available. In addition to the normal migration trend, it is to be anticipated that rural boys who entered the armed forces at 18 years and there obtained certain technical or scientific training, will increase this migration percentage.

At the same time, technological and scientific improvements and developments in business and industry pose the same problem as is evident in agriculture. If fewer men can accomplish more, there will be fewer job openings.

EDUCATION IN SOCIAL LEGISLATION

Social legislation such as the child labor laws, the Wagner Act, and the Walsh-Healy Act also have a direct bearing upon the obligation of education (*American Vocational Journal,* October, 1945: "Is There Too Much Social Legislation?" and November, 1945: "What About Youth in a '60 Million Job' Nation?"). Youth who migrate to industrial areas, or would leave school to work, find that they can not obtain employment until they have reached a specified age. Also, rural youth who meet the age requirement often find themselves at a handicap through lack of industrial or business skills. Without training for trades and industries particularly, they enter the labor market as unskilled workers.

AREA VOCATIONAL OR VOCATIONAL-TECHNICAL SCHOOLS

To meet this new challenge and obligation, education is giving ever-increasing attention to the establishment of area vocational or vocational-technical schools, and to the addition of 13th and 14th grades.

In spite of the spread of vocational education and the increased popular demand, thousands of communities are without its benefits or are only partially served. The reasons are obvious. Vocational education requires teachers with special trade or occupational training, and the tools and equipment essential to the pursuit of an occupation. Special training shops or laboratories also are necessary. The small one-room country school in a district with low valuation can not justify the expense involved in furnishing programs of trade and industrial education, distributive and office occupations training, agricultural education, and homemaking. In the fast-moving industrial world, also, today's inventions make obsolete yesterday's methods and machines, thus adding to the financial problems of the school which purports to provide *bona fide* vocational training. In agricultural states and rural areas, there may be a program of vocational agriculture, but the other vocational fields are not included in the curriculum in spite of the need which population and migration trends make obvious.

As described by the American Vocational Association (*Area Vocational Schools, The Enlargement of Opportunities for Vocational Education,* 1945): "An area vocational school as at present conceived, may be established, (a) as an extension of the offerings of an existing school system to reach wider geographical areas and larger numbers of pupils, (b) a separate vocational school established and maintained cooperatively by two or more existing districts in which specialized courses could be maintained economically and efficiently, (c) as a county school, and (d) as a state school designed to serve pupils for the entire state in one or more highly specialized fields." The Association recommends a strong vocational curriculum designed for the specific needs of a group of people heretofore largely ignored by educational programs. The curriculum should be sufficiently flexible to contract or expand with fluctuations of the employment cycle, should "accept placement and subsequent growth in a job as the ultimate goal of instruction; proficiency on the job the proper measure of success."

The purpose of an area vocational school would be to offer training preparatory to entering an occupation, and upgrading in a chosen occupation.

Actually there are hundreds of area schools already in operation although many are not so named. New York City, for example, has a Foods Trade School, a Needle Trades School, and the Gompers Vocational High School which serves the electrical trades. These schools provide special training for the entire area of New York City. Connecticut has many schools which are, in effect area schools. In other states the system and philosophy are well-established, and area schools have been serving the people for years.

Among the states which have passed legislation providing for area schools during 1945 are New York, New Hampshire, Minnesota, Maine, Georgia, and Washington where the new legislation provided specifically for 13th and 14th grades. In addition to state legislation providing for area vocational schools, provision is included in S. 619 and the companion bill, H. R. 4384 for Federal funds to assist states in this extension of education to meet the pressing need projected by an inevitable period of occupational readjustment, as well as additional funds for expanding the program in the established secondary schools.

VETERANS' EDUCATION

Training and retraining of veterans, foreseen as a major work for the school as soon as the war ended, was just beginning to assume the probable ultimate proportions at the end of the year. The natural reaction to military discipline and war's emotional pressures, together with the opportunity to earn at a high wage level during the war, were not conducive to an immediate return to school after demobilization. In spite of G.I. educational benefits, veterans have been slow to resume their education. The full impact of veteran enrollments probably will not be felt until 1946 in the vocational schools. The schools, however, were prepared to render the necessary services when the veterans returned. "As men and women now return from military service and from war industries, vocational schools again are changing and modifying their programs to meet the peacetime training and retraining needs of these individuals and groups. Essential to a war emergency, vocational education is equally basic to peacetime social and economic security. Through this training the nation maintains a vocational adequacy, both for the pursuits of peace and as a readiness for any new international exigencies" (*America's Vocational Schools,* the American Vocational Association, Inc., 1945).

Carrying over from the programs of war production worker training and food production war training, the special programs for veterans usually provide for entrance into a training program at any time and at the individual's present point of skill or knowledge; for termination of education and training upon satisfactory achievement with graduation upon this culmination of training rather than upon any pre-determined time requirements for earning specified credits. This concept of education and training is evident also in adult education and out-of-school youth programs not designed specifically for veterans. It is an emerging trend which may change radically the entire educational system, replacing rigidity of schedule with a flexibility which is based upon individual capacity to learn.

Nearly every state has mobilized its resources to provide the services veterans will need upon their return. Publications and directories have been issued, usually with the cooperation of the educational agencies and frequently by either city or state departments of education. The philosophy expressed in the Connecticut program is universal:

"When our veterans come back from the cold and wet foxholes of Europe, the jungle islands of the Pacific, and from our bombers, fighter planes, and warships, they will want job opportunities. They do not want to be pampered or catered to. They want to make their own way. That is what they are fighting for. If they are denied this opportunity they will feel they have fought in vain. To provide this opportunity we are endeavoring to see that every possible assistance in the way of information, counseling, training, education, and mental and physical aid is made available to them in their own home towns" (*Governmental Cooperation and the Returning Veteran in Connecticut Communities,* Council on Intergovernmental Relations, Washington, D. C., 1945).

Vocational schools and departments have been established throughout the country in accordance with that philosophy. In Detroit, a Veterans' Institute was created as a division of the Cass Technical High School. The Administration recognized the average high school courses as too slow, too immature, and too restrictive for war veterans who could scarcely be expected to "ask for hall passes" or to be subjected to a visit to the principal's office as a disciplinary measure. At Detroit's Veterans' Institute men or women may enroll any day, study any subject or combination of subjects they desire, may work as fast or as slow as their individual capacities permit, and "graduate" as soon as they have completed their work.

ADULT AND OUT-OF-SCHOOL YOUTH EDUCATION

Vocational education long has recognized its responsibility for providing for the needs of this group. There now is recognition of a broader service—helping the out-of-school youth between the ages of 18 and 25 particularly. Here is a period when he is not established or settled in a trade or occupation; a period when he experiments, flounders, and may experience disheartening failure. To follow-up and follow-through with this group is an increasingly important service.

Both mature adults and out-of-school youth can be classified as either the employed or the unemployed. Their education and training needs do not differ greatly. The employed group will need either supplementary training, upgrading training, or a program to prepare them for a change of occupation. The unemployed will need a long-term training program preparing them for entrance into an occupation, brush-up or refresher training if they have been out of employment but have at some time had work experience, or training in order to make a change if they do not desire to re-enter the field in which they have had some experience. These types of programs are not new to vocational education.

CARRY-OVER FROM WAR TRAINING

Breaking down instructional programs or courses into short units, so successful in the training of large numbers of workers for war industries, is carrying over into the peacetime rearrangement of the secondary school curriculum. To vocational educators, job analyses and the breakdown of a trade into blocks, operations, and steps is not a new procedure. It probably reached its maximum use as an educational device in organizing the short-unit, single-skill war training courses, and the lessons learned through this program are not being discarded.

Another carry-over "by popular request," are the courses in "repair, operation, and construction of farm machinery and equipment," and "production, conservation, and processing of food for family use,"—the latter through the establishment of school-community canneries. Enrollment data reveal that these two courses account for 82 per cent of all enrollments in the program of Food Production War Training. Thirty-four states reported a total of 5,520,466 farm machines repaired and put into use; 31 states canned 53,427,962 quarts of food for family use.

Extensive use of audio-visual aids, establishment of film lending libraries, and production of an ever-increasing number of acceptable training films, has accelerated the acceptance and use of this teaching device in the total educational program.

ADVISORY COMMITTEES

A closer relationship between schools and agriculture, business, industry, and labor developed during the year and is being earnestly fostered by educational leaders as a wholesome and beneficial development in school-community life. In planning for the future, the American Vocational Association advocates inclusion of advisory committees in state plans for area schools: "Each state plan should provide for a special state advisory committee on area vocational schools on which would be represented the employment services, prospective employers, labor and farm organizations, workers in the various fields for which training would be offered, and also men and women in the community whose judgment would be valuable in making necessary decisions pertaining to the function of the school, the program it should offer, the changes that would need to be made from time to time, and the placement in jobs of those whom the school has trained" (*Area Vocational Schools,* The American Vocational Association, Inc., 1945).

The use of advisory committees is not new, but the plan probably rendered its most extensive and effective service in the war training program. At the war's end, many leading industries continued to follow the pattern and presented to the schools their estimates of their need for trained manpower. As an example, testifying before a Senate sub-committee in hearings on S. 619, Douglas Whitlock, general counsel for the Structural Clay Products Institute, stated: "The construction industry will be called upon to execute a sixteen billion dollar a year building program that is geared to provide employment for eight and one half million men. In this annual post-war, sixteen billion construction market, masonry construction will maintain its proportionate share. With only 65,000 craftsmen available, 82,500 new brickmasons will have to be trained immediately."

WORK EXPERIENCE—TEACHER TRAINING

Work experience, both for learners and for their instructors, increasingly becomes a part of the educational program. The need for work experience in training has come to be considered the heart of a practical education system. Success of the men who were "loaned" to the schools by industry to act as instructors in the vocational war training program strengthened the convictions of those who have urged work experience or "internships" for prospective teachers during their preservice teacher training. Among recent experiments are the cooperative efforts of the Michigan teacher-training institutions, the State Board of Control for Vocational Education, the Ford and Chrysler companies, and Detroit retail establishments. Teachers, counselors, and school administrators from any state were privileged to enroll. They were paid the prevailing wage for the hours they spent on the job and received graduate credit from the institution through which they enrolled. Their evaluations of the program would warrant its extension.

Teacher training and teacher recruitment were major considerations during the year. Experienced teachers who left the elementary and secondary schools during the war years totaled 300,000 by early 1945, and probably no group suffered a greater proportional casualty than the vocational educators. For example, the loss of employed teachers of vocational agriculture was more of a factor in the teacher-supply situation than the number of new teachers trained and placed in vocational agriculture. Approximately 5,700 employed teachers left the work in the three-year period prior to June 30, 1944. The number of departments of vocational agriculture was reduced from 9,000 to 6,500 with lack of qualified teachers the usual reason.

SUMMATION

As the purposes and methods of vocational education are becoming better understood, there is emerging a clearer understanding of its beneficial services, and a realization that there is no conflict between general education and vocational education and its occupational adjustment service. Vocational education has, in practice, supplemented and in no way supplanted general education. The experience of the year opened the way for further expansion of the program of vocational education, coordinated with all other phases of the total educational service in the public schools.

ADULT EDUCATION

By J. O. Keller and H. G. Pyle
The Pennsylvania State College

GENERAL

The year 1945 saw the end of the war. Peace thrust many challenges before adult education agencies. What programs are available for vocational adjustment of military personnel? What can education bring to the serious misunderstandings of industrial relations? What should be our national policy with respect to loans to Britain; of the need for relief and rehabilitation of war-torn countries? Of national defense for the future including the question of universal military training? What of price control, taxes, wage levels; of the use of FM radio and of television for educational purposes; of social security and unemployment; of racial and cultural tensions? Adult education agencies can help to formulate intelligent opinion on these issues, given the means and leadership.

The ending of the war saw also the conclusion of the vast war training programs for industrial production. The educational programs for members of the armed forces were gradually coming to an end. Perhaps an indictment of us as a nation is that we do not with equal energy and promptness establish parallel educational programs dealing with problems of the peace. Public Law 346, providing educational benefits for service personnel is a step in this direction, but that legislation was passed as repayment of a debt owed our veterans. It did not attempt to meet real adult education needs. The rapidity with which scientific discovery was going ahead served notice, among other things, of the greater and greater urgency for a program of universal education emphasizing principles of international morality.

EDUCATION IN THE NAVY

During the war a strong program of off-duty education was carried on in the Navy known as Educational Services. It had two major functions: (1) to inform on the causes and progress of the war, and (2) to provide instructive use of leisure time. About 500 professionally trained officers in the educational service devoted full time to the carrying out of these functions. These officers were assigned at major naval establishments all over the world, and at continental naval hospitals. The Educational Services officer acts as administrator, determining needs and interests of personnel, recruiting instructors, assembling materials, and procuring needed classrooms. These officers also assisted in enrollment of correspondence and self-study courses of the United States Armed Forces Institute and also offered a guidance service.

The Educational Services at Pearl Harbor, for example, in May and June of 1945 saw 174 classes in operation in some 50 different subjects. Five thousand students were enrolled in a wide variety of courses, and the completion rate of these classes was relatively high, about 65 per cent. After V-J Day, there were several significant developments in the Educational Services program. During the war period the program was almost entirely an off-duty program. It now began to operate during working hours and was a great help in maintaining morale. The percentage of personnel enrolled in classes increased considerably. Subject matter choices reflected the post-war interests of the enrollees. A remarkable increase was noted in demands for help in formulating post-war plans. Classes at certain bases utilized all available space such as theatre, mess hall, barber shop, chapel, legal office, and gear lockers.

"Dewey University," in another instance, consisting of three Quonset huts set among palm trees, was established in the Philippines near Manila. Thirty-six classes were in session there in October, the faculty comprising both officers and enlisted men. All base personnel was permitted to attend at least one 55-minute class per day on duty time. Greater demand was also noted for correspondence courses offered by the Armed Forces Institute. The number of lessons submitted in these courses also increased sharply. Counselling interviews were reported by the hundreds, and in some large commands, such as in the Philippines, reports of monthly counselling interviews ran into the thousands.

Navy personnel also began to make increasing use of accreditation procedures. Results of a survey conducted in May and June indicated that 200,000 Naval personnel had already applied for credit. There were in the Navy about 2,000,000 men who had not completed high school, and for hundreds of thousands of them training and educational gains helped to advance their education. Testing became increasingly important in connection with accreditation, with the General Educational Development test proving most useful in giving an index of an individual's educational maturity. In September, on the Guam Island Command, 289 classes were in operation with a total enrollment of 3,989 persons. Self-study programs occupied an additional 3,701 persons. There were 1,004 enrollments for USAFI correspondence courses and other educational programs were in evidence.

Certain it is that a substantial percentage of men and women in the Navy availed themselves of educational opportunities. Men and women, taken suddenly from civilian life, carried with them their interest in learning and their plans to better themselves. They were willing by the hundreds of thousands to use their free time in study. Tens of thousands in the Navy were also sufficiently interested in helping their fellow service personnel to be willing to serve as teachers and instructors in their free time with no compensation other than satisfaction derived.

The training program for members of the Women's Reserve has been gradually decreased and was completed when the last class graduated in January, 1946. At its peak the training of WAVES represented preparation for duties in more than 36 fields.

EDUCATION IN THE ARMY

Records of the Information and Education Division, War Department, indicate that since April, 1942, there have been more than 1,200,000 enrollments by military personnel in correspondence and self-teaching courses available through the United States Armed Forces Institute. During the same period an estimated 1,500,000 took advantage of off-duty classes organized in military installations in the United States and the various overseas theaters.

Since the defeat of Germany, more than 1,000 schools, established within military units in Europe and the Pacific areas, have offered literacy training, secondary school subjects, vocational education including on-the-job training, and junior college courses to troops awaiting shipment home. The largest of several technical schools, utilizing Army equipment and civilian and military specialists for instructional purposes enrolls a total of 4,000 students in 21 trades every eight weeks. Approximately 50 foreign civilian colleges, universities, and other agencies offering definite educational and cultural advantages are serving a total of several thousand soldiers each month. In addition, Army university study centers, with a total capacity of 11,000, are functioning at Shrivenham, England, Biarritz, France, and Florence, Italy. Programs offered resemble the usual college summer school session. The staffs include qualified military personnel and over 350 faculty members drawn from American colleges and universities. In the Pacific area, a program similar to that in Europe developed rapidly after the defeat of Japan.

Civilian schools have experienced a need for accurate information about specialist training and other educational opportunities in the service in order that this experience might be evaluated for accreditation purposes. In order to meet this need, the American Council on Education prepared a handbook titled, *A Guide to the Evaluation of Educational Experiences in the Armed Services.* This guide includes information and credit recommendations concerning the Army Education Program.

Mention should also be made of publication of the excellent series of *GI Roundtable* pamphlets, dealing with topics deemed to be of greatest interest to service personnel. These pamphlets were prepared by the American Historical Association, well illustrated, carefully checked, are in attractive format, and were printed in quantities of 200,000 copies each.

VETERANS ADJUSTMENT

Probably in no instance was there more activity than in this one of educational programs for veterans. Veterans education is essentially adult education and the instructional program, methods of teaching, and facilities should be adapted to the needs and experiences of veterans. There are two categories under which veterans seeking education and training fall, although most all veterans with 90 days or more of service are entitled to education and training, either under Public Law 16 or Public Law 346. Veterans under P. L. 16 are those whom the Veterans Administration decides have vocational handicaps and thus entitled to vocational rehabilitation under its provisions. By far the larger number of veterans eligible for education and training are those eligible under P. L. 346. Veterans under P. L. 16 are required to participate in an advisement and testing service established by the Veterans Administration through the facilities of institutions of higher learning. The veteran under P. L. 346 is not required to avail himself of such services but he is being urged to seek analyses of his own ability and to understand vocational opportunities lying ahead before undertaking education or training. By following such procedures veterans can avoid selection of programs which they have little chance of completing; of entering programs for which their abilities are not suited; and of selecting vocations in which there is not so much chance of overcrowding.

Many agencies sprang to work on this post-war problem. In many cases the need arose in communities for coordination of the efforts of these many agencies. The National Education Association called a work conference in February 1945, following which it issued a comprehensive bulletin *Educational Programs for Veterans.* Other bulletins appeared; *Community Adult Counseling Centers* by the National Vocational Guidance Association; *Data for State-wide Planning of Veterans Education* by United States Office of Education; and *Veterans Guide* by the Public Affairs Committee. The Institute of Adult Education at Columbia University issued the third of its series on personal adjustment of veterans, *Adult Adjustment.* Many similar publications appeared.

It was almost universally agreed that, if the returning veteran is to be successfully reintegrated into civilian life, that process must take place at the community level. Notable jobs in this respect were done in a number of communities such as Bridgeport, Conn. There, in a community of 250,000 persons, community groups joined to set up such a service. The work was done under 30 cooperating committees representing different phases of the community's life. There were committees of labor (representing the 57 locals), of education, of lawyers, of religious leaders (120 priests, rabbis, and ministers), insurance men, of veterans organizations, and others. Each committee's chairman served on a reemployment and veterans advisory committee for the city. A house in central Bridgeport was purchased and became the Community Advisory Service Center. It was headed by a highly trained director. The staff included vocational counsellors, educational advisers, social workers, and psychometrists. These advisers endeavored to discover the individual's problems of adjustment and stood ready to give complete information on community resources. Besides these, the Center housed many other expert counsellors, either paid or unpaid, to advise on problems of insurance, finance, dietetics, law, psychiatry, and a host of others. Similar organizations were being attempted in many communities over the country with varying degrees of effectiveness.

Rhode Island set up a state committee on veterans retraining and reemployment. The function of the committee was to establish and to coordinate local centers for counselling. Since volunteer counsellors were used it was obviously necessary to give them some training. To achieve this end the committee asked the division of general college extension of Rhode Island State College to organize and conduct a specific course designed to provide volunteer counsellors with such training. Accordingly a 36-hour course in three parts was outlined. Hartford, Conn. established a Veterans High School, in December, 1944, with both day and evening sessions. Classes were segregated from regular high school classes, and the administration of the program was in charge of a director of adult education.

The Massachusetts Department of Education inaugurated an educational program for veterans under the auspices of state teachers colleges and The Massachusetts School of Art, with a state grant of $44,220. Cleveland's Y.M.C.A. Fenn College conducted a special workshop on veterans counselling for industrial personnel staffs. The New York State Vocational School in Troy was converted into a state-operated vocational school for veterans under the supervision of the New York State Education department. The first regional school for veterans guidance counsellors was held by the Veterans Administration at The Pennsylvania State College; subsequently such regional institutes were conducted elsewhere.

These developments represented only a few moves in this field but they were typical of what was taking place all over the country. The millions of returning service personnel represents not only a challenge in adult education; it is a crisis for public education in America. Returning servicemen will not and can not sit in school with the children of America. Obviously their experience and maturity demands adult methods of teaching. Finally they will expect and demand that their education be functional in terms of their problems of vocational, home, and civic adjustment.

WAR TRAINING PROGRAMS

After five years of great activity, the vast government-sponsored war production training programs came to an end on June 30. Broadly speaking, since the founding of these programs as an emergency measure in 1940, this vocational project under the direction of the United States Office of Education trained 12,000,000 men and women for war jobs at a cost of $500,000,000. By way of comparison, only 60.000 war workers were trained in public vocational schools during the First World War. The program, designed to prepare civilians to play a greater role in the war effort, operated on two levels.

The program at the college level was the Engineering, Science, and Management War Training Program. Participation was limited to colleges and universities granting degrees in one or more of the four fields designated, and a total of 238 institutions participated. These institutions offered courses not only on their own campuses but wherever in their locality war industries had a need for college level training. Instruction was carried on in over 1,000 cities, frequently in the plant being served. Classes were conducted at any hour of the day or night that would best suit the convenience and working hours of trainees. At the close of the program 42,568 classes had been operated with an enrollment of 1,795,625 trainees. Enrollment in the four fields was as follows: engineering 1,337,134; production supervision 387,238; chemistry 38,838; and physics 32,415. Six per cent of the trainees took courses which occupied their full time for a period of from six to 15 weeks in preparation for employment. The other 94 per cent of the trainees were largely composed of persons already employed in war industries who took part-time courses for preparation for more responsible positions. Congressional appropriations for carrying on this phase of the war production program totaled $94,500,000. In all 282,235 women, 14,315 veterans, and 25,158 Negroes entered the program. From all indications they proved eminently satisfactory. Persons with all types of backgrounds registered for these courses and in turn found themselves in one job or another where they could contribute to the war effort.

Statements from industrial executives indicated the great value of this program. With specialized training vitally needed in war industry, it greatly expedited war production. The program definitely proved that colleges and universities had a real contribution to make in the field of vocational training and that such training for adults could most feasibly be offered by extension. Funds available made it possible to bring the best training resources to the program, and its outcome indicated that university extension could also serve in peace-time industry, particularly where war workers would find it necessary to reconvert to peace-time jobs.

Greater numbers also registered for the vocational war training program at the high school level. Classes were actually operating in a number of states less than a week after the National Defense Training Appropriation had been approved by the President. Such a feat was possible owing largely to the cooperative relationship built up since 1918 between state and Federal vocational education agencies. Enrollment was in pre-employment training and in supplementary training courses. The supplementary courses provided intensive training for payroll jobs of persons who were already employed in war industries with the idea of increasing worker effectiveness in present jobs. In the five years from July 1, 1940 through June 30, 1945, a total of 7,469,506 persons registered for these courses, of which 2,667,449 persons registered for pre-employment training and 4,802,057 for supplementary courses. The greatest enrollment was for the aviation service, machine shop, and shipbuilding courses. Of the total trained 1,501,453 persons were women and 369,492 were Negroes. The training was given in more than 2,600 training centers, and appropriations totaled $326,900,000 for training during this period. The number of persons trained in California, Illinois, Michigan, New York, Ohio, Pennsylvania, and Washington comprised over fifty per cent of all trainees.

STATE ACTIVITIES

In some instances states began to take action looking toward state programs of adult education. The best known of such plans was in Michigan. There the legislature appropriated $250,000 for 1944-45 for an experimental program. Encouraged by the results, the legislature renewed the appropriation of $250,000 per year for the 1945-47 biennium. The experiment was established to assist communities to develop programs of their own design. The university and the state colleges received liberal grants which they were urged to use for off-campus service in helping communities. Neither the state department of public instruction nor the colleges imposed any blueprint on communities. Various institutions were assigned varying responsibilities. The motivating agency in this action was the Michigan Council on Adult Education in which was represented all agencies of the state making a contribution to the education of adults.

In South Carolina, ten Citizens' Education Centers, enrolling 2,000 persons, were in operation. These centers featured courses, panel discussions, forums, lectures, special skits and music, all planned to help adults at every educational level. Establishment of a system of adult education in the state of Washington was sought in a measure submitted to the legislature with an appropriation of $300,000 requested. The legislation would create an 11-member state adult education board and set up the position of a director. The proposed program would promote public forums, study clubs, discussion groups, community institutes and little theatres, lecture and lyceum services, and establishment of a packet lending library service which would furnish pictures, movies, records, and books. A similar bill was before the Colorado Legislature sponsored by several adult education groups in that state. It would appropriate $200,000 for the biennium and subsidize adult education in the local school district.

In several states, state officers in charge of adult education were being appointed. The first report of the director of adult education in New Jersey appeared during the year. California had a most extensive program in operation. In New York, a new formula allocating state aid in education made an additional $700,000 available for adult education purposes. The supervisor of adult education in Virginia reported a pronounced trend toward community organization for work on local problems. An interesting state plan for adult education was one proposed in Vermont by the post-war planning committee for Vermont colleges and junior colleges. The plan called for community programs controlled by local community education councils and emphasized autonomy of the local community as the basic principle to be followed, and also recommended the appointment of a full-time state director or coordinator of adult education. The supervisor of adult education in Connecticut reported 13,481 registrants in 1944-45 in 25 towns.

COLLEGES AND UNIVERSITIES

Colleges and universities are well equipped from the standpoint of resources to carry on adult education; yet institutions of higher learning have wavered between the theoretical and the practical, always hesitant to undertake a broadly conceived off-campus program for the public good. Land-grant colleges in particular were originally organized in each state as "peoples colleges."

Many institutions, nevertheless, are beginning to realize that universities should go to the people. This is evidenced by many typical developments. Syracuse University and the New York State Citizens Council scheduled a New York State Institute of Community Service for July 2-14. Iowa State College joined with other agencies in sponsoring a one-day guidance and adult education workshop. The University of Colorado offered a battery of courses preparing specialists for counseling work. The University of Tennessee cooperated with the Federal Bureau of Investigation in offering a police-training school. Rollins College offered accelerated courses for adults in Spanish at its inter-American center. Michigan College of Mining and Technology registered 900 men and women in the upper Michigan peninsula. Indiana and Butler universities announced the pooling of their resources in the Indianapolis area to meet the increasing demand for adult education. The University of Virginia continued its *New Dominion Series* of pamphlets dealing with cooperative efforts in communities. The University of California offered an expanded service to secondary schools of over 60 courses by means of supervised correspondence study. The University of Colorado initiated a series of community forums in six or eight rural communities, and the University of New Mexico conducted a series of six one-week institutes for the purpose of training rural community leaders. Many institutions opened new extension centers in their respective areas of service.

The University of Denver conducted its eleventh summer institute on parent education. The Pennsylvania State College resumed its technical institute activity on an expanded basis in leading industrial cities of the state. Five-year evening school curricula were offered in engineering, business, and the professions. Immediate expansion of the University of Missouri's facilities for adult education was being planned. A division of community services was established at Temple University. The Center for Continuation Study at the University of Minnesota was host for refresher training courses for physicians who had been in military service. Rutgers University resumed its evening engineering program after a four-year cessation. The University of Minnesota extension division issued an attractive 90-page study guide in its program of improved race relations. The Regents of the University of Washington declared that, as the result of their experience with the ESMWT program, they found not only great need but a substantial demand for supplementary adult education at the college level. A Division of Adult Education was established, and it was anticipated that its program might take the form of institutes of a week's duration in communities throughout the state.

Many institutions offered general professional training in adult education during the 1945 summer sessions. The Institute of Public Safety at The Pennsylvania State College, operating under a grant from the Automotive Safety Foundation, cooperated with each of 18 other colleges and universities in all parts of the United States in offering one-week institutes for the training of supervisors of commercial vehicle fleets. The University of Texas carried on an experimental community workshop in Medina Valley in which leaders of various communities were called together to discuss their social, economic, religious, recreational, and other community problems. Other institutions carried on such workshops in community education and leadership. The Pennsylvania State College continued its community workshops for county groups. Stanford University conducted a workshop on its campus for community leadership. Educational journals carried articles dealing with the backwardness of colleges in meeting demands for community adult education and the training of volunteer leaders.

The University of California conducted refresher courses for veterans in considerable numbers. Courses for practicing optometrists, dentists, physicians, and for other professional groups were also offered, as well as special institutes dealing with the various phases of adjustment of adults to post-war conditions. The University of South Carolina had a record 2,000 registrations for extension courses for teachers, and in common with many other universities cooperated in the war loan drive by distributing motion pictures. The University of Arizona had the largest enrollment in correspondence courses in its history and saw increasing demands for visual aids from schools. The department of adult education at Mississippi State College concentrated its efforts on preparing certified teachers to keep open the schools. Spring and summer workshops were organized in a number of communities each serving four or more counties. The University of Texas saw an expansion of its work in the field of distributive education and in trade and industrial education with a staff of 15 field workers in various aspects of that program. The University of Connecticut's extension activity experienced considerable growth with 13 extension centers being established. Purdue University in July announced the organization of a technical extension division charged with the responsibility of all extension activities except those specifically allocated to agricultural extension. Its Technical Institute program, launched in 1943, was expanded into a full-time day program with the beginnings of a permanent full-time staff. Demand for conferences, short courses, and other informal projects was limited only by the capacity of the university to organize such programs.

The University of Iowa carried on an extensive program of adult education using its radio station WSUI and also by means of 16 mm. motion pictures. West Virginia University began a modest program of extension work at the graduate level for credit. The University of Missouri offered short courses for water works operators in cooperation with the state sanitation commissioner. University College at the University of Chicago had remarkable success with two particular projects, one having to do with the training of business executives; the other with the giving of adults an opportunity to read and discuss the great books of Western culture. The University of New Hampshire, having placed all of its off-campus activities under one head, attempted to develop extension work of all colleges of the University on a par with that offered by the college of agriculture. Texas Technological College noted that extension class courses were again in demand in the cultural field where no demand was evidenced during the war. The Oregon State System of Higher Education, in common with many institutions, noted increasing demands for a study of Spanish, and 20 lectures by radio were offered in this subject at the University of Kentucky. In Oregon intensive courses in public health were offered in several communities. The University of Denver offered a number of evening classes on its "civic center" campus. University of Washington carried on a community forum program using faculty members full time.

WORKERS EDUCATION

Two surveys of workers education in progress appeared during the year. One was a study by the National University Extension Association entitled *University Extension and Workers Education*. The second was also a study of the interest and resources of universities in workers education. It was carried on by the American Labor Education Service. There was not yet a large amount of activity in the field. It seemed obvious, however, that if we are to build an economy designed to produce a large flow of consumer goods and maintain maximum employment at high wages we must soon agree to forego the luxury of continuing debate and conflict in this field. Not only was management training needed but it is obviously necessary that labor, too, must be guided by a wise and just leadership, aware of its responsibilities and having a new conception of its rights.

The extension service of the University of Michigan carried further its varied program of lecture-discussions, film forums, and courses related to union activities. A workers' education bureau was set up in Madison, Wis. as a demonstration of what a community could do locally to establish workers education on a firm basis. Registration at the California Labor School in San Francisco jumped from 100 three years ago to 800 persons at present. The New York State School of Industrial and Labor Relations got under way at Cornell University with a $200,000 appropriation for its first year.

Eighty-one students from 20 states attended a two-week summer school for office workers at Lake Forest College. The Philadelphia public schools initiated a program of education for union officers. Three hundred representatives of labor education, and management, attended the 15th annual Institute of Labor at Rutgers University.

The Workers Education Bureau of America carried on the publication of its monthly news letter which contains news of current developments in workers education. Its program of labor institutes was somewhat curtailed during the war period but despite restrictions institutes were conducted in California, Minnesota, Colorado, Iowa, New Jersey, Montana and Rhode Island. The Bureau worked particularly to expand the movement for cooperation with labor on the part of institutions of higher learning. The University of Chicago set up classes for trade unionists.

Mark Starr, Educational Director of the International Ladies Garment Workers Union, states: "During the war formal classes have decreased while activity programs and projects have increased. Our greatest stress has been upon classes for new members in the union and in the training of officers, paid and unpaid. We have cooperated with institutions of higher learning in providing facilities for trade union administrators and feel that this too is an important trend." The American Labor Education Service concerned itself with the problems of post-war planning, labor and government, race discrimination, the status of the white collar worker, full employment, labor's function in the community, and the extension of facilities for workers education. Its program included regional projects, conferences, field work, general advisory service, teacher and leadership courses, publications and residence schools.

AGRICULTURAL AND HOME ECONOMIC EXTENSION

Several changes in the plans and policies of the extension service were made during the year. Conferences have been scheduled more frequently with the objective of keeping extension workers informed on current research developments. At certain of these conferences the director invited in representatives of business, labor, education, the consumer and other civic interests so that their viewpoint could be presented on a common platform. These institutes at the Federal level served as pilot-type programs for state conferences.

The extension service also instituted a conference on the contribution of extension methods and techniques to the rehabilitation of war-torn countries. Conclusions of this meeting should provide a valuable source of information for sections of the world ravaged by war. Thirty agricultural and home economics extension trained persons have been sent as agricultural missionaries to China, the Philippines, and other parts of the world. The cooperative extension service also assisted in the training of agricultural students from numerous Latin American countries in extension methods, and 26 Chinese students received similar training.

Plans are being developed also for increased educational work in such fields as economics and public policy, marketing and distribution, and other socio-economic problems. Extension workers are being urged to make greater use of modern tools of education such as radio and educational motion pictures. Funds contributed by states and countries for cooperative extension work increased from $15,521,000 in 1940 to $21,141,000 in 1945.

LIBRARIES AND MUSEUMS

The American Association of Museums, with the continued backing of the Carnegie Corporation of New York, fixed its attention on post-war planning. The Association represents museums of art, science, history, and industry in the United States. Many museums were active in the field of adult education. The Buffalo Museum of Science, believing that hobbies will play an increasingly important role in post-war recreation, found a record enrollment in its autumn program of 21 such courses for adults.

Libraries worked to have adult groups use their collections. The Ohio legislature authorized an over-all survey of the library situation in Ohio asking for a report and recommendations in 1947. In the Tennessee Valley Authority area, regional library services were advanced significantly during the year. County library boards there utilized their contractual relationships with TVA to strengthen their program of library service. When TVA contracts expired, support for such increased library service was obtained from state appropriations. Many rural areas are now being served by bookmobiles and book depositories. Reports from all sections of the country show local libraries supporting adult education by supplying bibliographical material, appointment of adult education advisers, cooperating in community forum activities, assisting in citizenship training projects, compiling special book lists and collections, publishing adult study leaflets, promoting book reviews, circulating special packet selections and similar activities.

ADULT EDUCATION COUNCILS AND LOCAL PROJECTS

Adult education activities at the state level, referred to in an earlier section, do not give adequate details of the multitudinous and varied projects carried on by local councils and groups. It is possible only to list typical ones here. Baltimore's Adult Activities Council held an important conference on veterans education in October which contributed to the present functioning Veterans Institute. Similar conferences are being planned on "The Displaced Warworker" and on "Needs of Baltimore." The Adult Education Council of Chicago notes a consistent and steady growth in community organization and in citizen participation. The Council has published an excellent manual on community planning. The Adult Education Council of Cincinnati issues an interesting monthly bulletin *This Is Your Community* and publishes a directory of educational and cultural events in that city.

The Adult Education Council of Greater St. Louis, made up of 59 member organizations, publishes annually a *Directory of Adult Education Opportunities,* also a *Calendar of Program Events,* and will shortly issue an *Aerial Map of St. Louis and Vicinity* showing its educational, cultural, and recreational enterprises. The council serves organizations by recommending lists of speakers, sponsoring needed legislation, and serving the many other educational needs of adult groups. The Albany (N. Y.) Adult Education Council sponsors an annual series of discussions in leadership training meetings. The New York City Council sponsored a widely discussed meeting on "Public Adult Education." Philadelphia's famous Junto continued with a registration of thousands of persons. The Adult Education Council of Philadelphia began publication of *Philadelphia Adult Education News.* The Councils of Washington (D. C.), Denver, Schenectady, Boston, Phoenix, New Orleans, Honolulu, San Diego, to name but a few, carry on activities similar to these mentioned. Adult education councils representing larger areas functioned similarly.

An excellent up-to-date account of these council activities may be found in *The Inter-Council News Letter* published by The American Association for Adult Education.

PROFESSIONAL GROUPS

The National Education Association in 1945 expanded its services in the field of adult education by establishing this activity as a new division on the headquarters staff. The director of the new division will work in close conjunction with the NEA Department of Adult Education. The Department of Adult Education (NEA) grew steadily during the year in membership and emphasis in its programs was placed on veterans education. Those interested in the development of adult education issues in the past 20 years can profitably turn to the last annual report of the Director of the American Association for Adult Education.

The Institute of Adult Education (Columbia University) has made an expansion in its studies of the motion picture film as a medium of adult education and its quarterly publication *Film Forum Review.*

PUBLICATIONS AND AIDES

Excellent pamphlets continue to be published by various organizations which can well be used by adult study groups. Many of these pamphlets are listed in current issues of the *Adult Education Journal* and the *Adult Education Bulletin.* The American Library Association and the American Association for Adult Education and other groups issued pamphlets bearing on the use of films for film forum projects. It is evident that FM radio broadcasting can have educational uses which are not now appreciated. Connecticut and Pennsylvania have plans for state systems while a number of cities are planning for the use of FM channels locally. Cleveland, Chicago, and San Francisco are already using radio for classroom instruction on an extensive basis. The whole project is adult education on the upper level. Educators requested 15 FM channels in hearings before the Federal Communications Commission. Instead of 15 channels they were granted 20 which allocation should permit establishing about 800 educational radio stations which if properly spaced could blanket the United States.

Commercial stations have outdone themselves in many respects in educational endeavors despite much popular resentment over so-called "commercials." The CBS program "School of the Air" and NBC's "University of the Air" are excellent features. In its 16th year, the CBS School was this fall moved to five P.M. (ET) in order to permit grownups to hear it and also to allow parents and children to listen together. Other public service broadcasts of note include talks on books, science, national affairs, forums and many special events.

NEGRO EDUCATION

By William Anthony Aery
Administrative Assistant, NACA Langley Memorial
Aeronautical Laboratory

GENERAL

Liberal leaders throughout the South took an aggressive stand during 1945 on the question of equalizing educational opportunities for all American Negroes through Federal aid to education and spoke out vigorously in favor of improving institutions that deal with problems of higher education for Negroes.

Northern leaders in education, both white and Negro, favored coordinated educational programs to assist Negro veterans and war workers who must return to home communities that have been vastly changed by the effects of the Second World War.

Race relations, despite many tensions, tended to improve through numerous group conferences that were held to discover true facts, and, in the light of sound information, leaders formulated new and better plans of Negro education.

The General Education Board and the Julius Rosenwald Fund continued throughout 1945 their far-sighted and well-planned programs that have aimed to train effective and responsible Negro leaders in the life of the nation—in education, health, civic improvement, scientific research, economics, and racial cooperation activities.

Southern states recognized more fully than ever before their responsibility for Negro education, particularly on the higher levels. With real courage and foresight, white leaders conferred with Negro leaders to find out more specifically what should be done through education to raise the level of Negro efficiency in the American way of life.

Negro leaders spoke more clearly and incisively their convictions concerning the educational limitations and capabilities of the 13,000,000 Negroes whom they represent.

The emphasis in Negro education during 1945 was definitely on higher education, but always the present-day Negro leaders kept one foot on the ground in calling for more and better elementary, secondary, and vocational schools.

The workshop idea in education was worked hard by several of the leading institutions for the higher education of Negroes. This idea, one may hope with good reason, will bring rich fruits in the coming years.

FEDERAL AID

At the New England Association of Colleges, Universities, and Secondary Schools, Frank P. Graham, president of the University of North Carolina, made a vigorous plea for Federal aid to education (*School and Society*, Jan. 27). At *The New York Times* conference on education, held in January 1945, Mordecai W. Johnson, president of Howard University, urged a Federal program that would lift Negro education to higher levels. He contrasted the costs in education—whites in New York, $6,000 per classroom per year, Negroes in Alabama, less than $100 per classroom. President Johnson presented figures showing that 1,100,000 Negro children did not attend school at all, while in 15 states, in which 1,900,000 Negro children live, there were no four-year high schools. Out of 9,000,000 Negro Americans in 18 states, there are

30,000 candidates for high-school graduation.

Benjamin Fine (*The New York Times,* Jan. 29) summarized the objections to Federal aid presented at the Conference as follows: "It would mean Federal control; it would cause regimentation; it would upset the American democratic way of life; it would force wealthier states to pay for the education of the poorer ones; and, finally, Federal aid is unnecessary." White and Negro leaders have heard these objections repeated many, many times, and still believe that Federal aid will definitely improve the status of 13,000,000 American Negroes.

EDUCATIONAL PROGRAMS

Dr. Anson Phelps Stokes, president of the Phelps-Stokes Fund (New York), discussed "American Race Relations in War Time" paid a tribute to the General Education Board as the organization that has done as much as any for the Negro (*Journal of Negro Education,* Fall 1945). Raymond B. Fosdick in his annual report for 1944 disclosed that the Board had made new appropriations of $3,073,976, roughly two-thirds of which was for the advancement of Negro education.

GENERAL EDUCATION BOARD CONFERENCES

The Board financed four regional meetings to study the problems of graduate education for Negroes during the summer of 1945—Durham (N. C.), Nashville (Tenn.), Jackson (Miss.), and Prairie View (Texas). A fifth meeting was held in Birmingham (Ala.) on Oct. 29. At these meetings, Negro and white educators worked amicably and frankly together, each group presenting and interpreting the data pertinent to each region and to the South in general.

The Conference members were faced with the great discrepancy which exists in opportunities for and support of graduate work in Negro institutions as compared with the white colleges and universities; the lack of doctoral curricula in Negro institutions; the meager facilities for study leading to the Master's degree; and the lack of library facilities in Negro higher institutions.

The Birmingham meeting adopted the following resolutions: (1) Every properly prepared graduate student, white or Negro, should have access to competent graduate instruction; (2) We recognize that the graduate programs available for Negroes are far from adequate; (3) We recommend that the compensation for Negro instructors be the equivalent of that for white instructors of equal attainments; (4) We favor the development of strong regional graduate schools in which special interests may be emphasized. . . . For the Negroes, regional centers seem to offer . . . the most immediate and effective relief; (5) As a temporary expedient, we favor for Negroes out-of-state aid in the form of scholarships; (6) We have also been favorably impressed with the qualities of educational leadership evinced by the Negro educators who attended these Summer meetings (*School and Society,* Jan. 5, 1946).

ELEMENTARY EDUCATION IN VIRGINIA

In 1943-44, there were 1,474 Negro elementary schools (white, 1,928) and 120 high schools (white, 456). For 1939-40 there were 1,639 Negro elementary schools (white, 2,278) and 126 high schools (white, 498). In short, the median Negro elementary school has about 32 pupils; the median Negro high school has about 80 pupils. What can be done for such small schools is the problem that Virginia educational leaders are trying to solve through a program of school consolidation. F. G. Lankford, Jr., associate professor of education at the University of Virginia and director of instruction for the schools in Albermarle County, estimated that Virginia would be required to spend some $50,000,000 to carry out an adequate and statewide consolidation program for its present 3,402 elementary and 576 high schools (*University of Virginia News Letter,* Dec. 1). Therefore, before Negro education in Virginia can be improved greatly the whole problem of public education must be refinanced.

ELEMENTARY EDUCATION IN NORTH CAROLINA

Grade enrollments in Negro public schools are still exceedingly out of balance. The following figures for North Carolina, 1943-44, are significant of Negro schools in general, although the figures are localized: Grade one, 53,253; two, 32,561; three, 31,939; four, 29,396; five, 25,300; six, 22,152; seven, 19,040; elementary special, 240; eight, 15,080—total, 228,961; nine, 11,323; ten, 8,608; eleven, 6,601; twelve, 2,092; high-school special, 27—total, 28,651; and grand total, 257,612. Of 1,000 Negro pupils who entered the first grade of North Carolina schools in 1933-34, some 405 reached grade two; 363, grade three; 332, grade four; 284, grade five; 257, grade six; 216, grade seven; 176, grade eight; 126, grade nine; 100, grade ten; and 77, grade eleven—and of this number 58 were promoted from grade eleven. Of 1,000 white pupils, some 238 were promoted from grade eleven (*State School Facts,* March, 1945).

The number of Negro pupils enrolled in the first grade of North Carolina schools for 1943-44 was 52,253 which represented an excess of 28,606—or a 116.1 per cent excess enrollment over births. This figure in 1924-25 stood at 308.1 per cent and in 1934-35 at 257 per cent. The percentage of pupils who remained in the first grade dropped from 64.2 in 1927-28 to 42.3 in 1942-43. For Negroes in the first grade the survival has changed from 35.8 per cent in 1927-28 to 57.7 per cent in 1942-43. Some 46.2 per cent of Negro pupils remain in the first grade (white, 14.6). In short, Negroes are sending more and more of their children to the first grade; they are helping their children to a better school adjustment; and they are more concerned than in former years with cooperating agencies for school and community improvement.

There has been a tendency for the number of Negro elementary schools to decrease. The figures for North Carolina are typical of the South: 1939-40, 2,063; 1940-41, 1,979; 1941-42, 1,911; 1942-43, 1,879; and 1943-44, 1,852 (*State School Facts,* Dec.). This downward trend is also characteristic of white elementary schools.

SECONDARY EDUCATION

Negro high-school students, in terms of scholastic work, show better accomplishment in city schools than they do in county schools, according to North Carolina figures (*State School Facts,* Sept.) which follow: Negro high-school students, 1943-44, grades 9-12, 26,046 for the State (city units, 10,999; county units, 15,047); city units, percentage doing full year's work, 85.64 (county, 82.31), half-year's work, city units, 7.86 (county, 8.23), less than half year's work, city units, 6.50 (county, 9.46; index of accomplishment, city units, 91.19 (county, 88.79).

Fifty Negro administrators from high schools in 13 states held a workshop at Dillard University (New Orleans) and discussed "Problems and Opportunities Confronting Negro Youth." Nearly half of the Negroes between 18 and 38 have seen military service. Some 700,000 Negroes in the South were in the armed forces. Large numbers wish to finish high-school training under the provisions of the GI Bill of Rights. Thousands of Negroes will need educational guidance when they return to civilian life. The Negro high-school principals explored four major fields—economic and social readjustments of returning veterans; professional opportunities; opportunities in business and in industry; and adaptation of curricula to the needs and talents of Negro youth.

RURAL EDUCATION

Negro colleges and universities continue to make a serious attack on the problem of Negro rural education. Prof. Mabel Carney (*Journal of Ne-*

gro Education, Fall 1945) summarized the work in Negro rural education which is being done at Howard, Fisk, and Atlanta universities for the benefit of rural-education leaders, school teachers and supervisors, graduate students engaged in workshop discussion conferences, and special community workers, such as Jeanes supervisors, health, recreation, and youth organizers. Professor Carney also paid tribute to the constructive work of Hampton and Tuskegee for the training and improvement of leaders in Negro rural education.

There were in Virginia, according to the *Annual Report* of the Superintendent of Public Instruction, 1944, 1,552 one-teacher schools—847 for Negro pupils and 705 for white pupils. Seven grades were taught by one teacher in each of 884 of these schools. In 297 of the one-teacher schools, there was an enrollment of 40 or more pupils. The one-teacher school has been held as definitely inferior to any other type of school with respect to educational efficiency. The mean per capita cost of salaries for cities was $76.79 (counties, $43.37); cost of education per pupil, not including debt service and capital outlay, for the cities was $161.92 (counties, $62.27). In one county the cost of education per pupil was as low as $35.05. A large percentage of the Virginia population received its education in rural schools. In short, Virginia's rural schools have been educating a large proportion of the citizens in its cities. Negro pupils have been and still are at the low end of all the educational scales (H. M. Jarman, *University of Virginia News Letter,* Nov. 1, 1945).

North Carolina also faces the problem of one-teacher rural schools. For the year 1943-44, this state had 807 one-teacher schools in county units—Negro, 603 (white, 204). In contrast there were only 58 Negro schools with 10 or more teachers (white, 403). In North Carolina Negro elementary schools have decreased from 2,339 in 1930-31 to 1,852 in 1943-44, white, from 2.897 to 1,660 (*State School Facts,* Dec. 1945).

HEALTH EDUCATION

Virginia's Negroes have infant, maternal, and general death rates much higher than the white population, according to Leland B. Tate of the Virginia Polytechnic Institute. In 1940 urban Negroes had an infant death rate of 90 per 1,000 live births (white, 42). Midwives attended about two-thirds of the rural Negro births and one-third of the urban, but only a small percentage of all white births.

Venereal infection is from 10 to 15 times as high for Negro pre-marital partners as for white couples. The Negro tuberculosis death rate was 3.5 times the white rate. The expected life span for Negroes is at least 10 years less than the expected 60 or more years for white persons. There are fewer than 200 Negro physicians and only 150 Negro nurses in Virginia to serve some 661,000 Negroes.

Only six of Virginia's 112 hospitals and sanitoriums are full-fledged service centers for Negroes—Central State Hospital (Petersburg), 3,521 beds for mental patients; State Colony (Petersburg), 300 beds for mental patients; Piedmont Sanitorium (Burkeville), 269 beds for tuberculosis patients; Dixie Hospital (Hampton), 91 beds for general patients; Whittaker Memorial Hospital (Newport News), 44 beds for general patients; and Burrell Memorial Hospital (Roanoke) 44 beds for general patients.

Slightly more than one-third of the beds in state-supported sanitoriums are for Negroes and almost one-third of the beds in city sanitoriums. The ratio on the basis of population groups appears equitable, but on the basis of Negro need it is dangerously low.

The Negro education study committee of the Denny Commission in Virginia, late in January, suggested the training of Negro nurses at the Medical College of Virginia located at Richmond.

A committee, headed by Dr. J. Earl Moreland, president of Randolph-Macon College, recommended (1) that the inadequate provisions now being made for the professional education of Negroes be corrected in the fields of pharmacy, nursing, law, and social work, and (2) that Virginia use its present facilities in professional schools for the training of all students who desire professional education (Newport News, Va., *Daily Press*, Jan. 27, 1946).

EDUCATION OF VETERANS

It has been estimated by the Veterans Administration that at least 1,000,000 Negroes who have served in the armed forces will have to find reemployment. Of this number some 700,000 will come from the South and about 70 per cent fall in the farm group. Since many Negro veterans will not return to the South or even to the farm, literally many thousands of Negroes will have to use their new skills and new freedoms outside the Southern farm economy.

The GI Bill of Rights, it is expected by many leaders, will open doors that are now closed to Negroes. Industry, on the other hand, may be powerless, in the face of adverse community pressures, to undertake responsibility for dealing with tension over inadequate or insufficient housing, transportation facilities, educational opportunities, or blind prejudice that affect Negroes. The labor leaders, whether AFL or CIO, see in Negro veterans an important group worth cultivating. What the Negro veterans decide will greatly influence American life tomorrow.

During the Second World War, Negroes learned many new skills. The total Negro civilian employment increased by 1,000,000. Negroes did more important industrial work than they ever did in a non-war period of four years. They earned more money and lived better than they did prior to Pearl Harbor. In the Army and Navy, Negroes did whatever tasks were assigned them. "Some fought. Some flew planes. Some drove trucks. Some built roads. They did the numberless jobs of a war—their leaders point out—that was advertised around the world as a fight for freedom and democracy. They say they have earned the right to better treatment at home. . . . Most of the qualified generals and admirals have praised the work of the Negro soldier" (*United States News*, July 13).

The U. S. Office of Education sponsored a conference on "Postwar Education of Negroes" and through a grant by the Julius Rosenwald Fund published a 71-page report, late in December, which was edited by Dr. Ambrose Caliver, senior specialist in the education of the Negro. This report emphasized the educational implications of Army data and experiences of Negro veterans and war workers. The objective of this Federal conference was to assist major educational associations and educational institutions among Negroes to plan the collection, interpretation, dissemination of information pertinent to Negro veterans and war workers, as well as to promote a program of educational coordination among Negro and white leaders. Similar conferences, held on the regional, state, or local levels, have been recommended.

Some conclusions were as follows: (1) Negro veterans and war workers will need assistance in readjusting to normal peacetime living, because of the changes that have taken place in them and because of the changes that have taken place in their home communities. Because of the minority status of Negroes their problems will frequently be accentuated. (2) Negroes will have improved in educational advancement, in occupational skills, and in health status, and will have developed self-confidence, broadened economic contacts, widened social horizons, and will have expanded their concepts concerning both their rights and obligations as citizens of a democratic nation. They may be expected, therefore, to work more diligently for the realization of the aims for which the Second World War was fought. (3) Negroes will face many changes that have taken place in their home communities—social, economic, recreational, educational, and governmental. Numerous agencies, public and private, have been formed to assist veterans and war workers. These agencies must coordinate activities for Negroes so that there will be a minimum of duplication, confusion, and waste. (4) Negro schools and colleges are among the most important agencies which have a responsibility in initiating, prosecuting, and coordinating plans and activities for needed adjustments in the post-war period. These institutions at present are not adequately prepared to meet this responsibility. (5) Specific groups must minister to specific needs of Negroes—counseling, teaching, school and college administration, community improvement. (6) Improved race relations is largely an educational matter and, therefore, all good Americans should help to provide equality of educational opportunity for every citizen. (7) Those who fought together and won the victory learned to respect and appreciate each other.

HIGHER EDUCATION

Four-fifths of the total Negro population live in the 17 Southern states and the District of Columbia which require by law separation of the races for purposes of education, according to Prof. Charles H. Thompson, Howard University (D.C.), who is the editor of the *Journal of Negro Education*. He adds:

"Ninety per cent of the Negro students now in college and professional schools and between 90 and 95 per cent Negro college and professional school graduates are the products of separate Negro colleges and universities. . . . The overwhelming majority of Negroes obtain their higher and professional education in segregated schools and two-thirds of those who graduate remain in the South—or go South" (*Journal of Negro Education*, Fall 1945).

Negroes in 17 Southern states and the District of Columbia who have had four years or more of college, according to the Census of 1940, number 52,646 (1.08 per cent) *vs.* white 842,355 (4.72 per cent). The figures for the United States follow: Negroes 80,842 (1.2 per cent) *vs.* whites 3,067,783 (5.4 per cent).

The South in general, and the Negro population in particular, is dangerously short of professional workers in medicine, dentistry, and law, to mention only a few outstanding fields of public service. The South needs the leadership in community improvement that is furnished by professionally trained Negroes.

An index of education in the 17 Southern States and the District of Columbia is found in the following figures dealing with resident graduate students 1939-40: Negro, public institutions, 87 (white, 8,577), private 683 (white, 7,335)—total Negro, 750 (white, 15,912).

Professor Thompson (*Journal of Negro Education*, Fall 1945) called attention to the disparity between professional-school opportunity given Negroes in the South and members of the white race in the following figures which deal with institutions:

Profession	White		Negro	
	Public	Public and Private	Public	Public and Private
Medicine	15	16	0	2
Dentistry	4	8	0	2
Law	16	17	1	2
Engineering	17	17	0	1
Social Service	9	9	0	2
Library Science	11	13	1	1
Pharmacy	14	14	0	2

Prof. Martin D. Jenkins of Howard University (Washington, D. C.) listed 60 significant programs in operation in Negro colleges and universities through the cooperation of some 20 Negro leaders. These programs include the United Negro College Fund, Atlanta University System, Land-Grant College Social-Studies Project, Atlanta University-Urban League Study of Business and Business Education, Veteran Counseling and Training, National Student Health Association, Orientation Institute in Health Education, Graduate Work in State Institutions, Regional Conferences on Graduate Education Commercial Dietetics Curriculum, Teacher-Education Program, Personnel Program, Student Selection, Premedical Education, Inter-group Relations, Nursing Education, Public-Relations Program, and General Education.

The United Negro College Fund (New York) raised $1,030,000 during 1945 in the second annual national campaign in 45 cities, Thomas A. Morgan, chairman of the drive to assist 32 colleges, announced in October. The Greater New York City campaign committee, headed by Frank M. Totton, raised $330,203. The national foundations committee reported contributions amounting to $194,618. Industry contributed $300,000. Negroes gave $155,000. The general chairman of the Fund is John D. Rockefeller, Jr. Walter Hoving served as chairman of the executive committee. F. D. Patterson, president of Tuskegee Institute, is president of the Fund, and W. J. Trent, Jr., is executive director (*The New York Times,* Oct. 5).

Governor Darden of Virginia proposed in January 1945 that Virginia, North Carolina, and Tennessee pool their resources in a program of higher education for Negroes.

EDUCATIONAL COOPERATION

Alabama.—A movement for the improvement of Negro schools in Montgomery (Ala.), began in 1936, came to fruition in 1945. The improvements in Negro education were achieved with the whole-hearted support of the white citizens and they demonstrated that there is enough progressive sentiment among Southern people who have responsibilities of leadership to solve race relationships constructively, if they are permitted to do so without undue pressure.

In 1936 only a few Montgomery Negro teachers held degrees. This was changed to 53.6 per cent in 1945. Five out of seven principals of Negro schools hold master's degrees. Two junior high schools have developed into senior high schools that train hundreds of pupils. Inadequate school buildings have been replaced with two- and five-room modern structures. These new buildings receive constant repair and paint service. The school term has increased from six months to eight months. Free textbooks are furnished. Some salaries have trebled. Parent-teacher organizations are in operation. Democratic practices in administration prevail (*School and Society,* June 30).

Mississippi.—The board of trustees of the institutions of higher learning, Jackson, issued a 402-page report, *Mississippi Study of Higher Education 1945* (Joseph E. Gibson, director), which summarized in 30 pages the detailed development of Negro education. He found that less than one-half of the 2,180,705 people in Mississippi are Negroes, and that they are served by 10 small colleges. Important grants have been made to Jackson College by the Julius Rosenwald Fund and the General Education Board, which, with its limited facilities, is preparing Negroes through first-hand teaching experience for responsibilities as rural leaders. This college employs 24 regular and part-time instructors. It is estimated that Mississippi will need several hundred specially trained Negro teachers for its rural schools for the next few decades.

Virginia.—There is vast need of cooperation between white legislators and Negro leaders to secure adequate pay for Negro teachers. The salaries of Negro teachers for 1943-44 received careful study by G. Tyler Miller, president of the Virginia Education Association and superintendent of schools of Charlottesville (*University of Virginia News Letter,* Nov. 15). In the counties, 2,787 Negro teachers received an average salary of $878 (white, $1,087); in the cities, 1,222 Negro teachers received an average annual salary of $1,579 (white, $1,766). In the counties, 132 Negro principals received an average annual salary of $1,176 (white, $2,004); in the cities, 56 Negro principals received an average annual salary of $2,516 (white, $2,946).

Georgia.—Atlanta University during the summer conducted seven workshops for 250 Negro teachers seeking self-improvement in their regular school programs. The science workshop enrolled 36 teachers who discussed science in general education, science experiences for children, science in health programs, use of tools for research, reading problems in science, everyday science of the countryside, science and language, and problems of youth.

The language-arts workshop attempted to clarify the special difficulties which Negro teachers face and to evolve methods of attacking these difficulties. The topics follow: standards in English; cooperative efforts to improve English; remedial and developmental reading; oral reading; levels of English usage; the meaning of language; backgrounds of modern English; common speech defects; and English pronunciation.

The health-education workshop discussed these topics: programs for healthful living; communicable diseases; health instruction in elementary and junior high schools; and community sanitation. Cooperating sponsor of this workshop was the Georgia State Department of Health.

A third workshop was devoted to the improvement of local school programs. A fourth was devoted to the teaching of home-economics students. Another aided arts and crafts teachers. Still another was concerned with school supervision.

OPA CONFERENCE

In cooperation with the Office of Price Administration a conference on "Wartime Economic Stability and Postwar Prosperity" for Negroes was held at Hampton Institute on Aug. 6. John W. Davis, president of the West Virginia State College for Negroes and director division of research and analysis, President's Committee on Fair Employment Practice, was the principal speaker. The Conference concerned itself with finding out what school administrators in cooperation with other leaders and citizens can do to stabilize Negro economy, make effective educational programs, teach economic competency, and develop economic literacy among Negroes. William Mason Cooper, director of the Hampton Summer School, presided.

CONFERENCE OF SOUTHERN STUDENTS

The Conference of Southern Students was organized on April 15, 1945 at the University of North Carolina. It included representatives from 54 Southern colleges and universities, of whom 14 represented Negro colleges in the South. The conference passed several resolutions, including the following one: "There should be included (in the Charter of the United Nations Organization) an international bill of rights and privileges of all people regardless of race, color, creed, or national origin." One of the two students who represented the Conference at San Francisco during the charter deliberations was a Negro student from Meharry Medical College (Nashville, Tenn.). The Conference received national recognition and approval.

INSTITUTE OF RACE RELATIONS

The Institute of Race Relations which was held at Fisk University, sponsored by the American Missionary Association, brought together in July over 140 teachers, social workers, government personnel, and religious leaders, drawn from 27 states, for a three-week period during which 64 lecturers and consultants emphasized the importance of having a Federal racial policy to meet post-war problems and of striving for adequate legislation to meet the problems of racial adjustment. The employment of more Negroes in more of the gainful occupations was stressed. Negro urban development after the war, the elimination of Negro slums, the reclamation of human and material resources, and bi-racial development were topics that received full discussion. Dr. Edwin R. Embree predicted the end of racism and nationalism and the end of world domination by Western powers. "We shall be forced," he said, "to discover how diverse peoples and nations may tie together successfully in a shrinking world."

PUBLICATIONS

Some 750 references to books, bulletins, pamphlets, monographs, and periodicals dealing with the Negro and his problems, particularly the Negro and his education, were printed in four issues of the *Journal of Negro Education* for 1945. Some outstanding material on Negro education follows: *Adult Education for Negroes in the United States* edited by Charles H. Thompson; *Journal of Negro Education,* Yearbook No. XIV; *Color and Democracy* by W. E. B. DuBois (Harcourt); *Educational Programs for Veterans* (National Education Association); *One America,* edited by Francis J. Brown and Joseph S. Roucek (Prentice-Hall); *Riots and Ruins* by A. Clayton Powell, Sr. (R. R. Smith); *Planning for Postwar Education in the United States* by Susan O. Futterer (U. S. Office of Education); *Postwar Education of Negroes,* edited by Ambrose Caliver (U. S. Office of Education); *Primer for White Folks,* edited by Buklin Moon (Doubleday-Doran); *Religion in Higher Education among Negroes* by Richard I. McKinney (Yale University Press); *Rockefeller Foundation—A Review* by Raymond B. Fosdick (Rockefeller Foundation); *State-wide Planning for Veterans' Education* by E. V. Hollis (U. S. Office of Education); and *Statistics of the Education of Negroes* by David T. Blose and Ambrose Caliver (U. S. Office of Education).

LIBRARIES

By Mildred Othmer Peterson
American Library Association

DEMOBILIZATION AND POST-WAR PLANS

Since the end of the Second World War, librarians have begun to put in motion post-war plans formulated during the past several years. Detailed national plans for library development were made in March 1945 and presented in December 1945 to the midwinter Council meeting of the American Library Association. Favorable action had previously been taken by the Council, approving, in principle, standards for public school, prison, hospital, and college libraries (see 1944 THE AMERICAN YEAR BOOK, "Libraries"). A supplementary statement on standards of support for public libraries providing school library service was published in the *A. L. A. Bulletin* for March 1945 (p. 116). *School Libraries for Today and Tomorrow; Functions and Standards* (American Library Association) was published in 1945 as Number 5 in the series, Planning for Libraries.

There was considerable progress in state planning during the year, especially in Washington, Alabama, New York, Ohio, and Connecticut. In the last three named states, commissions are studying existing library conditions as a basis for statewide library development.

In all types of libraries, the demobilized war veteran and war worker were receiving special attention. Adult education services were developing, and techniques successful in army training programs or in the organization of library service for the armed forces were increasingly applied to civilian libraries (for further information on the immediate readjustments to peace in the library field see all 1945 issues of the *A. L. A. Bulletin, College and Research Libraries,* and *Library Journal*).

RELATIONS WITH FEDERAL AGENCIES

One of the main interests of the Library Service Division of the U. S. Office of Education and the Federal Relations Committee of the American Library Association was the proposed disposal of surplus war property to educational agencies such as libraries. The Surplus Property Act (Public Law 457) provides for priorities and special price concessions to educational institutions. They are being allowed a 40 per cent discount below the established fair value. The Division of Surplus Property Utilization of the U. S. Office of Education requested that each state designate or create a state educational agency for surplus property, which would allocate such property within the state. Libraries are allowed to procure surplus property: (1) through the state educational agency for surplus property; (2) through the regional offices of the Reconstruction Finance Corporation; and (3) through competitive sales. Included in surplus property are the Army camp libraries which will probably be distributed to communities as units, complete with equipment, catalogs, and books.

Considerable interest on the part of librarians was also manifested in the Educational Facilities Bill (H. R. 4499), which promises, "through aid to the states, for surveys of the need for public educational plant facilities, $5,000,000; for the preparation of drawings and specifications for such facilities, $40,000,000; and for their construction and acquisition, $1,500,000,000." Public libraries are included by definition, and it was estimated that library building would require $400,000,000.

During the year several projects were considered by the Joint Committee on Government Publications, representing the American Library Association, American Association of Law Libraries, Association of Research Libraries, and Special Libraries Association. This committee was formed in 1943 "to consider problems of publishing, of storing materials for distribution after the war, of acquiring public documents and expediting their acquisition, and related matters." The projects of the committee included the possibility of establishing an office in Washington to procure and distribute ephemeral material; a plan for distribution of processed (photomechanical) materials through the issuing agencies; the trial establishment of a weekly list of processed publications received in the office of the Superintendent of Documents; and the preservation and distribution of all restricted and confidential publications issued during the war.

EUROPEAN BOOKS FOR AMERICAN LIBRARIES

The American Library Association's Board on Resources of American Libraries and the Library of Congress have been interested in securing, for American libraries, European books which were not available during the war years. A delegation of librarians left for Europe on this mission late in December, 1945.

They are also interested in securing a more adequate representation of Russian books for American libraries. In this connection they have brought to the attention of the State Department the importance of negotiating with the Russian Government to secure interchange of cultural materials between the United States and Russia as a means of fostering better relations between the two countries.

NATIONAL RELATIONS OFFICE

Because of the growing need of a National Relations Office in Washington, librarians and friends of libraries collected in 1945 two-thirds of the funds necessary for its maintenance during the next four years, with a view to some subsequent permanent establishment. The office was opened in October 1945 "to advance and project the interests of libraries and of the people who use libraries, in so far as those interests may be helped or hurt by legislation, regulation, or other government action." The American Library Association, through this office, "will seek no advantage for itself, no special privileges for its members; it will work for the improvement of libraries as agencies for the dissemination of information, the diffusion and advancement of knowledge, and for the extension of library service to all of the people of the United States."

INTERNATIONAL ACTIVITIES

The challenge, the opportunity, and the responsibility of the relations of North American librarians with librarians in other parts of the world were more impressive in 1945 than ever before. The American Library Association administered funds from various foundations and government sources amounting to $895,000, spent for library activities in the international field. This amount covered numerous library projects in Latin America and war areas of Europe and the Pacific.

Carl M. White, director, Columbia University libraries, spent several months in London as library consultant for the United States delegation to the conference of Allied Ministers of Education. Luther H. Evans, appointed Librarian of Congress June 16, 1945, was a member of the American Commission to London for discussion of the international office of education and cultural cooperation. Carl H. Milam, executive secretary of the American Library Association, attended the United Nations Conference at San Francisco as a consultant appointed by the American Council on Education. In October, C. R. Sanderson, chief librarian of the Toronto Public Library, visited England with a delegation appointed by the Book Publishers' Branch of the Board of Trade of Toronto.

Operation of the American libraries in Mexico City, Managua, and Montevideo under the supervision of the American Library Association, has continued. Many Latin American librarians, as well as some from England, China, India, and other countries, visited North American libraries. Numerous students from foreign countries are studying in United States library schools (see *"Libraries"* THE AMERICAN YEAR BOOK, 1944).

At the request of the Minister of Education, three United States librarians went to Rio de Janeiro to advise in connection with the reorganization of the national library of Brazil. Library schools were conducted for the second year in Lima, Peru, and in Montevideo, Uruguay. The United States Department of State has continued to allocate funds for United States books for Latin America, China, the Philippines, and the near East. Rockefeller Foundation grants have continued for the purchase of scholarly and scientific journals to be stored in the United States for distribution to foreign countries when transportation is available. There are also Rockefeller grants for the purchase of outstanding books of reference and research for libraries in war areas.

American libraries, formerly operated by the Office of War Information, in London, Sydney, Melbourne, Wellington, Johannesburg, Bombay, Cairo, Cape Town and Lisbon have been transferred to the jurisdiction of the Department of State. New American libraries and reading rooms are opening from time to time under this program; some in occupied countries since the declaration of peace.

AMERICAN BOOK CENTER

In June, 1945, the American Book Center was established under the auspices of several national library associations in order to coordinate the efforts of groups interested in collecting gift books for war-damaged libraries of the Allied Nations. Early in 1946, the Center planned to conduct a drive for 1,000,000 printed items, including books, pamphlets, and documents. The British Library Association revealed that more than 1,000,000 books were destroyed by fire in German bombing raids on England, most of them in municipal libraries.

AMERICAN LIBRARY IN PARIS

International conferences and government missions gave many American librarians the opportunity for interchange of ideas with foreign colleagues. Milton Lord, librarian of the Boston Public Library, went to France to observe and report on conditions in the American Library in Paris, which remained in operation during the Nazi occupation. The library is now engaged in soliciting books and funds for an expanded program.

STATE AND LOCAL LIBRARY DEVELOPMENT

In 1945, the American Library Association Library Extension Board marked its 20th year of activity. It was established in 1925 "to consider what the American Library Association should do to assist in the development of adequate library service for people who are now without it." Through the years, it has been building a foundation of informal public opinion, particularly with national agencies. It has stimulated interest among librarians in new movements, such as, state planning or state aid for large units. It has provided encouragement, advice, basic materials, and information for individuals, groups, and organizations, working for the extension of this service.

According to a survey made, 96,920,941, or 74 per cent, of the people of the United States had public library service in 1945, compared with 60,640,723, or 57 per cent, in 1925. Thus, 26 per cent of the people were without public library service in 1945, compared with 43 per cent in 1925.

In 1925, 82 per cent of the total rural population were without public libraries. Today, omitting Alabama and Texas where separate figures were not available, 54 per cent of the rural population are still "have-nots."

During the 20-year period, cities over 10,000 population without public libraries, dropped from 49 to 39, and the largest city without one, from 60,000 to 39,000 population. The number of counties without a public library within their boundaries dropped from 1,135 to 587. State library extension agencies increased from 41 according to law (35 in actual operation) to 47, Arizona being the only one without such an agency. In 1925, 223 counties in 31 states had county library service, compared with 722 counties in 42 states in 1945.

Increasing momentum was indicated during 1945 by advances in legislation, appropriations, and the establishment of large unit libraries.

A survey of statewide public library service was started in New York in 1945 under the auspices of the research division of the state Department of Education and at the instigation of the State Library Association. In Ohio, the legislature established a library survey commission to study current library laws, financing, and services. It is to make recommendations regarding library interests to the next legislature.

ADULT EDUCATION

It is estimated that 25,000,000 adults will be interested in enrolling in adult education courses after the war, with interests divided primarily between vocational courses, professional and scientific study. Librarians working with adults are concerned, since the library as a source of informal education is the only institution available to many who wish to participate. The American Library Association Adult Education Board "reemphasized that continuing self-education is essential in a democratic society and that the library is potentially the best single source for informal self-education."

Rapid progress was made in the use of films for information, especially for adults, and for training during the war. If the country is to capitalize on new film uses, particularly in adult education, methods must be worked out to make films readily available in every local community, and this consequently becomes a potential library responsibility. A number of libraries already have film collections or serve as information exchanges. Some act as booking agencies, and many more each year are using films in educational forums and discussion meetings.

Librarians have been working on the problem of the distribution of educational films with the Educational Film Library Association and the National 16mm Advisory Committee to the O. W. I. Bureau of Motion Pictures. Extensive developments of film services in libraries are being considered. These include: plans for new buildings including rooms for previewing and auditioning films and records; plans for housing and distributing these materials, and for demonstrating their use; and film guidance, comparable to existing readers' advisory services, which most large libraries have.

HOSPITAL LIBRARIES

During the year, hospital librarians organized as a division of the American Library Association with the purpose of "promoting the establishment of libraries for patients and personnel in hospitals; furthering their better organization and administration; interesting public libraries and other agencies in extending library service to hospitals and advancing professional training for hospital library service." This group, through the American Library Association, sponsors the publication, *Hospital Book Guide.*

LIBRARY TRAINING AND PERSONNEL

A critical shortage in personnel and a general upward trend in salaries in industry greatly affected all personnel conditions in libraries during the final year of the Second World War. As in industry, library positions far exceeded the number of trained and clerical personnel available.

Several of the largest libraries adopted new salary schedules based on classification plans and a number of medium-sized and small libraries either revised their compensation schedules or originated new pay plans. Salary scales in business, industry, and government so exceeded those paid in most libraries that the latter were forced partially to meet this competition or lose large numbers of their personnel. In some libraries where budgets were small or where adjustments could not be made, it was necessary to curtail hours of opening.

Improvements in retirement allowances, vacations, and observances of public holidays have been achieved for library personnel in at least half of the states. Several libraries were placed under civil service during the year with the result that their staffs are able to obtain pension benefits available to other municipal employees.

Demands continued for additional librarians needed in work with the armed forces, in camps and hospitals. In addition, there were numerous opportunities for librarians in the Federal service and in war industries. Librarians with knowledge of science, technology, and business subjects were also in demand as were catalogers, childrens' librarians, and school librarians.

The salaries received by the 1945 classes in library schools again exceeded salaries paid 1944 graduates by several hundred dollars.

For the first time since 1940, when the decline in enrollments began, library schools throughout the country reported an increase in the number of students in comparison with the preceding year. Enrollment for the year in the 32 accredited library schools in the United States was 1,023, compared with 917 for the fall of 1943. In the two Canadian library schools, 41 students were enrolled in 1944-1945, whereas 25 attended the previous year. Since its founding in 1887, the School of Library Service, Columbia University, has had 3,261 graduates. The Library School, University of Illinois, established in 1893, has the second highest number —2,236.

SURVEYS AND STUDENTS

According to an American Library Association survey on reading in more than 100 public libraries, the average American civilian was reading about his own personal problems first and about the war and the state of the world second. The survey also showed that there was an increase in the circulation of books by libraries for the first time since the United States began to prepare for war.

Opinion Research Center made a study of public attitudes toward and awareness of public libraries in cooperation with the American Library Association and libraries in metropolitan areas. Results were published in the *American Library Association Bulletin* for November, 1945. In brief, it was discovered that 41 per cent of the people interviewed said that reading was a favorite way of spending spare time; among those interviewed, about 75 per cent were library users, though only 32 per cent were actual members. About one fourth get most of their books from public libraries. One in five uses public libraries; one in 20 uses rental libraries; one in 100 uses both. Forty-five per cent have no idea how public libraries are financed and another 23 per cent are uncertain. Ninety per cent think the public library is a valuable community asset, however.

The following reports on studies were published in the *Library Quarterly:* "The Reorganization of the Library of Congress, 1939-44", October, 1944; "Some Problems of Soviet Librarianship as Reflected in Russian Library Periodicals," and "Australian Books and American Readers," July 1945.

College and Research Libraries included: "Loan Clientele of State, University, and Land-Grant College Libraries", December, 1944; "New Periodicals of 1944," March, 1945; and "New Periodicals of 1945," September, 1945.

GIFT CITATIONS

Encouraged by substantial evidence that educational philanthropy has been stimulated by the citations established in 1939, the Board of Editors of *Who's Who In America* decided to initiate similar citations commemorative of gifts to American libraries. The donors singled out for citations and honorable mention in 1944-45 are: Mary Jane Harter Haymer to the Troy (O.) Public Library; Vida G. Jacks to the Monterey (Calif.) Public Library; Alfred Fuhrman to the San Francisco Public Library; James Chesterman Stodder and George Tyler Stodder to the Bangor (Me.) Public Library; Eugene Goldstein to the Plymouth (Penn.) Public Library; and Mrs. William Henry Bush to the Amarillo (Tex.) Public Library.

Many new "Friends of Library" groups were organized throughout the country. These with others already established are promoting new library buildings and county libraries, and raising money to purchase more books as well as helping to secure increased appropriations and legislation for statewide library service.

GRANTS AND BEQUESTS

During the year, the following private book collections and funds were given to libraries: to Stanford University Library, the Hutton Webster Folklore Collection; to the library of Southern Illinois Normal University, a Lincoln and American history collection donated by Clint Clay Tilton; to the University of Illinois Library, a 6,000 volume economics library from Janet Weston, in honor of her father; to the Minneapolis Public Library, $50,000 from the Citizens Aid Society; to Columbia University Library, a collection of classics and incunabula from the late Dr. Gonzalez Lodge; to The Free Library of Philadelphia, 17th century Shakespeare folios by P. A. Widener and Mrs. Josephine Widener Wichfeld; to Texas Christian University Library, deluxe limited editions of American, English, and French literature and history from Mrs. Goodall H. Wooten; to Muscoda, (Wis.), the library, home, and personal property of Dr. Charles R. Pickering; to the Tulsa Public Library, the Diggs library of classical literature and history by the Tulsa Jewish Community Council; to the University of Arizona Library, several thousand books, valued at over $10,000, from the Friends of the Library; to the Princeton (Ill.) Public Library, $10,000 from the estate of Alfred Norris; to the Montezuma (Ind.) Public Library, the library and art collection of the late Lula J. Case; to the Macalester College Library (St. Paul) the greatest collection of American hymnology in the United States from Arthur Billings Hunt; to the Library Association of Portland (Ore.) a bequest of income, amounting to about $2,500 a year for books, from the will of Thomas Roberts; to the Library of Congress, a Rockefeller Foundation Grant of $47,000 for the establishment of a Slavic Center; to the Youngstown Public Library, a $100,000 trust fund the income of which is to be devoted to the purchase of books, from the late Justice John H. Clarke; to the Forest City (Ia.) Public Library a $58,700 trust fund, the income of which is to be used for the purchase of books, from Mrs. Annie Russell; and to the Technological Department of the Carnegie Library of Pittsburgh, $66,195 from the Pittsburgh chapter of the American Chemical Society to supplement regular book funds.

FUNDS FOR BUILDINGS

Funds given for buildings include: to Newark (Ohio) Public Library, $27,500 under the will of Mrs. Jessie Clark Thomas; to Cairo (Ga.) Public Library, $35,000 by the Roddenberg family; to Kewanee (Ill.) Public Library, a $25,000 trust fund in memory of Edward Poole Lay; to the Jewell (Ia.) Public Library, $25,000 for the establishment of the E. W. Montgomery Memorial Library; to the Avon (Mass.) Public Library, $82,000 from the will of H. Lawton Blanchard; to Princeton University, $1,000,000 from the Firestone family toward a $3,500,000 Harvey S. Firestone Memorial Library; to the Elmwood (R. I.) Public Library, $100,000 through the will of Mrs. Sophie Knight Rousmanieve; to the Pomeroy (Wash.) Public Library, $10,000 from Mary Liggett; to Walla Walla (Wash.) Public Library, $20,000 by the will of T. C. Elliott; to Lake Geneva (Wis.) Public Library, $100,000 from Mrs. Mary Gridley Bell; to Bradley Polytechnic Institute, Peoria, (Ill.) $37,500 from Friends of the Library for a new library building; to the Birmingham (Ala.) Public Library, a residence and funds for a branch library from Dr. and Mrs. Thomas D. Parker; to Florence (Ala.) $25,000 from the Rosenbaum family plus $11,000 and local buildings from other individuals for a city-county library building and a bookmobile for rural service from the American Legion Post; to Baldwin-Wallace College, Berea, (O.) $152,000 from George W. Ritter for a library building; to Kahoka and Clark Counties (Mo.) $90,000 from H. E. Sever for a memorial library building; and to Dodgeville, (Wis.) $10,000 for a library building.

Throughout the war years, little new construction of buildings has been done but plans for buildings are being made by many libraries. The following are among those with funds available for buildings: Oakland (Calif.) Public Library, California Academy of Science, Paine College Library (Augusta, Ga.), University of Iowa Library, Forbes Library (Williamstown, Mass.), Cincinnati Public Library, and San Diego Public Library. Numerous war memorials will take the form of library buildings or book collections, including the national memorial to Ernie Pyle in Dana, Ind.

AMERICAN LIBRARY ASSOCIATION OFFICERS

For the year 1945-46: president, Ralph A. Ulveling, Public Library, Detroit; first vice president and president-elect, Mary U. Rothrock, Tennessee Valley Authority, Knoxville; second vice president, Emerson Greenaway, Enoch Pratt Free Library, Baltimore; and treasurer, Rudolph H. Gjelsness, University of Michigan, Ann Arbor.

MEMBERSHIP AND OFFICE

Over 14,000 librarians, library trustees, and individuals interested in library service are members of the American Library Association which was organized in 1876 to promote the foundation and improvement of libraries in the United States and Canada. American Library Association headquarters are at 520 North Michigan Avenue, Chicago 11, with Carl H. Milam, executive secretary. During 1945, the Association purchased an historic Chicago mansion at 50 East Huron Street which will become its headquarters when remodeling is completed. An International Relations Office is maintained in the Library of Congress Annex, Washington, D. C., with Harry Miller Lydenberg, director. A National Relations Office, operated by the Association, was opened in October, 1945, at 1709 M Street, N. W., Washington 6, D. C., under the direction of Paul Howard.

CONFERENCES

The usual summer and winter conferences were not held during the war. A midwinter meeting convened Dec. 27-30, 1945, in Chicago, and the annual conference is scheduled at Buffalo, N. Y., June 17-22, 1946.

ANNUAL AWARDS

Robert Lawson won the 24th annual Newbery Medal for *Rabbit Hill,* judged the best contribution to children's literature in the preceding year. The Caldecott Medal, given for the most distinguished picture book, was awarded to Elizabeth Orton Jones for the illustrations of Rachel Field's *Prayer for a Child.* The American Library Association citations of merit to library trustees were presented to M. M. Harris, president of the San Antonio (Tex.) Public Library Board, and Mrs. Albert W. Errett, president of the board of directors of the Public Library, Kewanee (Ill.) A third citation was awarded posthumously to a former trustee of the North Carolina Library Commission, Charles Wedbee, of Hartford. The 27th preson in the history of the American Library Association to be elected an honorary member was Halsey W. Wilson, president of the H. W. Wilson Company, who was honored in recognition of his "contribution to library efficiency and to every field where books and periodicals are used."

FINANCES

The Association's income in 1944-1945 (excluding cash balances amounting to $197,000 on Sept. 1, 1943) was about $1,133,800. Income from membership dues, sales of publications, advertising, subscriptions, etc., was approximately $223,700; $76,500 was income from endowment funds; $53,600 came from librarians for the establishment of the American Library Association National Relations Office in Washington; $188,000 was in payment of group retirement annuity premiums; and $592,000 came from outside sources in the form of grants or payments for 25 specific purposes. The endowment was about $2,110,000.

PUBLICATIONS

Five periodicals are published by the Association: the *American Library Association Bulletin, College and Reference Libraries, The Booklist, The Hospital Book Guide,* and *Subscription Books Bulletin.* The following are a few of its additional publications during 1945: *National Medical Library, School Libraries for Today and Tomorrow, Catalogers' and Classifiers' Yearbook #11, Buying List of Books for Small Libraries* (7th ed.), and *Books Published in the United States, 1939-1943.*

In the fall of 1945, The Association began the distribution of phonograph recordings of classic children's stories told by Mrs. Gudrun Thorne-Thomsen. This project is in cooperation with the American Library Association Division of Libraries for Children and Young People, which is interested in the preservation of fine examples of the storyteller's art.

Among the books in the field produced by other publishers were: Carnovsky and Martin (eds.), *The Library in the Community* (University of Chicago); Rider, *The Scholar and the Future of the Research Library* (Hadham); Lydenberg and Archer, *The Care and Repair of Books* (Bowker); Rankin, *Children's Interests in Library Books of Fiction* (contributions to Education #906, Columbia University); Hacket, *Fifty Years of Best Sellers 1895-1945* (Bowker); Davis, *Pictorial Library Primer* (Demco Library Supplies); *Frederic G. Melcher; Friendly Reminiscences of a Half Century Among Books and Bookmen* (Book Publishers' Bureau); Wilson and Tauber, *The University Library; Its Organization, Administration and Functions* (University of Chicago); Dewey, *Abridged Decimal Classifications* (6th ed., Forest); and Sears, *List of Subject Headings for Small Libraries* (5th ed., H. W. Wilson).

NECROLOGY FOR 1945

Abbott, Right Rev. H. P. A., Episcopal Bishop of the Diocese of Lexington (Ky.), 63, April 4.

Achmed Abdullah, author, playwright, and adventurer, 64, May 12.

Adams, Herbert, sculptor, 87, May 21.

Adams, Col. Porter H., aeronautics pioneer and former president of Norwich University, 51, Dec. 5.

Agnelli, Giovanni, Italian automobile industrialist, 79, Dec. 16.

Ahmed Ziwer Pasha, former Premier of Egypt, Aug. 21.

Ainley, Henry, English Shakespearean actor, 66, Oct. 31.

Albee, Dr. Fred H., orthopedic surgeon, 68, Feb. 15.

Alger, Dr. Ellice M., ophthalmologist, a founder of the National Society for the Prevention of Blindness, 74, Feb. 18.

Alwin, Dr. Carl Oskar, former conductor of the Vienna State Opera and conductor of the Opera Nacional (Mexico), 54, Oct. 15.

Appleton, Robert, publisher, 80, Jan. 19.

Argentinita (Encarnacion Lopez), Argentine classical dancer, 47, Sept. 24.

Armetta, Henry, film character comedian, 57, Oct. 21.

Armstrong, Dr. Edward F., British chemical consultant and former president and chairman of the Royal Society of Arts, 67, Dec. 15.

Arosemena, Florentio H., former President of Panama, 72, Aug. 30.

Arundale, Dr. George S., president of the International Theosophical Society, 66, Aug. 12.

Aston, Dr. Francis W., British scientist and Nobel Prize winner in chemistry (1922), 68, Nov. 21.

Atherton, Frank C., civic leader and philanthropist in Hawaii, 67, May 29.

Atwood, Right Rev. Julius W., retired Episcopal Bishop of Arizona, 85, April 10.

Ayres, Philip W., social worker and forester, 84, Nov. 3.

Azariah, Right Rev. Vedanayakam Samuel, native Indian Anglican Bishop of Dornakai, South India, 70, Jan. 2.

Baker, Dr. S. Josephine, child health specialist, 71, Feb. 22.

Baldwin of Bewdley, Countess, wife of the former Prime Minister of Great Britain, June 18.

Balfour, Second Earl of, former M. P. and Chief Secretary for Ireland, 91, Jan. 14.

Barbier, George, stage and screen actor, 80, July 19.

Barlow, Sir Thomas, British physician, former physician extraordinary to Queen Victoria and Edward VII, 99, Jan. 12.
